

$$\rightarrow A = -\frac{1}{2}, B = \frac{3}{2}$$

$$\begin{aligned}\therefore f(z) &= \frac{-1}{2}(z-1)^{-1} + \frac{3/2}{z-3} \\ &= \frac{-1}{2}(z-1)^{-1} - \frac{3/2}{2-(z-1)} \\ &= \frac{-1}{2}(z-1)^{-1} - \frac{3/2}{2\left[1-\frac{(z-1)}{2}\right]} \\ &= \frac{-1}{2}(z-1)^{-1} - \frac{3}{4} \sum_{n=0}^{\infty} \left(\frac{z-1}{2}\right)^n \\ &= \frac{-1}{2}(z-1)^{-1} - 3 \sum_{n=0}^{\infty} \frac{(z-1)^n}{2^{n+2}}\end{aligned}$$

Example: Represent the function

$$f(z) = \frac{1}{1+z}$$

into a series of negative power of z .

Solution:

$$\begin{aligned}\frac{1}{1+z} &= \frac{1}{z\left(1+\frac{1}{z}\right)} \\ &= \frac{1}{z} \left(\frac{1}{1+\frac{1}{z}} \right) \\ &= \frac{1}{z} \sum_{n=0}^{\infty} (-1)^n \left(\frac{1}{z}\right)^n \\ &= \frac{1}{z} \left[1 - \frac{1}{z} + \frac{1}{z^2} - \frac{1}{z^3} + \dots \right] \\ &= \frac{1}{z} - \frac{1}{z^2} + \frac{1}{z^3} - \frac{1}{z^4} + \dots, \left(\left| \frac{1}{z} \right| < 1 \rightarrow |z| > 1 \right)\end{aligned}$$

Example: Evaluate Taylor series of $f(z) = \log(1+z)$ about zero.

Solution: note that $f(z) = \log(1+z)$ is not analytic when

$$\operatorname{Im}(1+z) = 0 \text{ and } \operatorname{Re}(1+z) < 0$$

$$\rightarrow y = 0 \text{ and } x+1 < 0 \rightarrow x < -1$$

$$f(0) = \log 1 = 0$$

$$f'(z) = \frac{1}{1+z} \rightarrow f'(0) = 1$$

$$f''(z) = \frac{-1}{(1+z)^2} \rightarrow f''(0) = -1$$

$$f^{(3)}(z) = \frac{2}{(1+z)^3} \rightarrow f^{(3)}(0) = 2$$

$$\vdots$$

$$\therefore f(z) = \log(1+z) = z - \frac{1}{2!}z^2 + \frac{1}{3}z^3 - \frac{1}{4}z^4 + \dots, (|z| < 1)$$

[2] Laurent Series

If a function f fails to be analytic at z_0 , then we can apply Taylor's theorem at z_0 . It is possible however, to find a series representation for $f(z)$ involving both positive and negative powers of $(z - z_0)$. Now, we represent the theory of such representation and begin with Laurent theorem.

Laurent's Theorem:

If $f(z)$ is analytic inside and on the boundary of the ring $\mathcal{R}$ bounded by two concentric C_1 and C_2 with center z_0 and respective radii r_1 and r_2 , then for all z in $\mathcal{R}$

$$f(z) = \sum_{n=0}^{\infty} a_n (z - z_0)^n + \sum_{n=1}^{\infty} \frac{b_n}{(z - z_0)^n}$$

Such that:

$$a_n = \frac{1}{2\pi i} \oint_{C_1} \frac{f(z)dz}{(z - z_0)^{n+1}}, \quad n = 0, 1, 2, \dots$$

$$b_n = \frac{1}{2\pi i} \oint_{C_2} \frac{f(z)dz}{(z - z_0)^{-n+1}}, \quad n = 1, 2, \dots$$

Note:

1. If f is analytic on and inside C_2 , then $b_n = 0$, i.e.:

$$b_n = \int f(z)(z - z_0)^{n-1} dz, n = 1, 2, \dots$$

2. Laurent's theorem can be reform as:

$$f(z) = \sum_{n=0}^{\infty} a_n (z - z_0)^n$$

Such that: $a_n = \frac{1}{2\pi i} \oint_{C_1} \frac{f(z)dz}{(z - z_0)^{n+1}}$, $n = 0, 1, 2, \dots$, where C is any simple closed curve lies between C_1 and C_2 .

3. If f is analytic on and inside C_1 then the Laurent series turns to Taylor series.
4. The Laurent series expansion contains negative powers and usually begins from $-\infty$.
5. The Taylor series expansion about z_0 is a special case of Laurent expansion, that is when calculating Laurent coefficients in this case all the negative power coefficients appear as zeros and the Taylor series remains.

For example, if $n = -1$ then $(z - z_0)^0 = 1$ and the function is analytic i.e. ($\oint_C = 0$), and it is the same when $n = -2, -3, \dots$

6. z_0 might be the only singular point of f on C_1 and in this case $0 < r_2 < r_1$, so the series will be at the region $0 < |z - z_0| < r_1$.
7. Taylor series can be written for a point inside the circle.
8. Laurent series can be written for a point outside the circle.

Example: Represent $f(z) = \frac{1}{(z-1)(z+2)}$ into a Laurent series about $0 < |z - 1| < 3$.

Solution:

$$f(z) = \frac{1}{(z-1)(z+2)}$$

$$= \frac{1}{3} \frac{1}{(z-1)} - \frac{1}{3} \frac{1}{(z+2)}$$

We don't need to make it $(z-1)$, the singular points are $1, -2$.
Note that the singular point $0 < |z-1| < 3 \nexists -2$.

$$f(z) = \frac{1}{3(z-1)} - \frac{1}{3} \left(\frac{1}{3+z-1} \right)$$

$$= \frac{1}{3(z-1)} - \frac{1}{3} \cdot \frac{1}{3} \left[\frac{1}{1+\frac{z-1}{3}} \right]$$

$\rightarrow \frac{1}{1+\frac{z-1}{3}}$ is a geometric series and $a = 1, r = \frac{z-1}{3}$ with alternative sign $(-1)^n$.

$$f(z) = \frac{1}{3(z-1)} - \frac{1}{3^2} \sum_{n=0}^{\infty} (-1)^n \frac{(z-1)^n}{3^n}$$

$$\left| \frac{z-1}{3} \right| < 1 \rightarrow |z-1| < 3$$

The other part of the region $|z-1| > 0$ we avoid that $|z-1| \neq 0$ in the term $\frac{1}{3(z-1)}$.

In the same example about $1 < |z| < 2$

$$f(z) = \frac{1}{3} \frac{1}{(z-1)} - \frac{1}{3} \frac{1}{(z+2)}$$

$$= \frac{1}{3} \cdot \frac{1}{z} \left(\frac{1}{1-\frac{1}{z}} \right) - \frac{1}{3} \cdot \frac{1}{2} \left(\frac{1}{1+\frac{z}{2}} \right)$$

$\downarrow$

$|1/z| < 1$
 $\rightarrow 1 < |z|$

$\downarrow$

$|z/2| < 1$
 $\rightarrow |z| < 2$

$$\therefore f(z) = \frac{1}{3z} \sum_{n=0}^{\infty} \left(\frac{1}{z} \right)^n - \frac{1}{6} \sum_{n=0}^{\infty} (-1)^n \left(\frac{z}{2} \right)^n$$

Example: Expand $f(z) = \frac{1}{z^2(z-1)(z-2)}$ in a Laurent series about $z_0 = 0$.

Solution: the possibilities depend on the singular points 0, 1, 2:

Case 1: $0 < |z| < 1$

Case 2: $1 < |z| < 2$

Case 3: $2 < |z| < \infty$

♦ Case 1: if $0 < |z| < 1$

$$\begin{aligned} f(z) &= \frac{1}{z^2} \left[\frac{1}{z-2} - \frac{1}{z-1} \right] \\ &= \frac{1}{z^2} \left[\frac{1}{1-z} - \frac{1}{2} \frac{1}{1-\frac{z}{2}} \right] \\ &= \frac{1}{z^2} \left[\sum_{n=0}^{\infty} z^n - \frac{1}{2} \sum_{n=0}^{\infty} \left(\frac{z}{2} \right)^n \right] \end{aligned}$$

$|z| < 1$ & $\left| \frac{z}{2} \right| < 1 \rightarrow |z| < 1$ & $|z| < 2$, note the connection between the intervals and the solution, then $0 < |z| < 1$.

♦ Case 2: if $1 < |z| < 2$

$$\begin{aligned} f(z) &= \frac{1}{z^2} \left[\frac{1}{z-2} - \frac{1}{z-1} \right] \\ &= \frac{1}{z^2} \left[\frac{-1}{2} \frac{1}{1-\frac{z}{2}} - \frac{1}{z} \frac{1}{1-\frac{1}{z}} \right] \end{aligned}$$

$\left| \frac{z}{2} \right| < 1 \rightarrow |z| < 2$ & $\left| \frac{1}{z} \right| < 1 \rightarrow |z| > 1$, note the connection between the intervals and the solution, then $1 < |z| < 2$.

$$\begin{aligned} \therefore f(z) &= \frac{1}{z^2} \left[\frac{-1}{2} \sum_{n=0}^{\infty} \frac{z^n}{2^n} - \frac{1}{z} \sum_{n=0}^{\infty} \left(\frac{1}{z} \right)^n \right] \\ &= - \left[\sum_{n=0}^{\infty} \frac{z^{n-2}}{2^{n+1}} + \sum_{n=0}^{\infty} \frac{1}{z^{n+3}} \right] \end{aligned}$$

♦ Case 3: if $2 < |z| < \infty$ ($|2/z| < 1$)

$$f(z) = \frac{1}{z^2} \left[\frac{1}{z-2} - \frac{1}{z-1} \right]$$

$$= \frac{1}{z^2} \left[\frac{1}{z} \frac{1}{1-\frac{2}{z}} - \frac{1}{z} \frac{1}{1-\frac{1}{z}} \right]$$

We need $|z| > 2$, so

$\left| \frac{2}{z} \right| < 1 \rightarrow |z| > 2$ & $\left| \frac{1}{z} \right| < 1 \rightarrow |z| > 1$, note the connection between the two intervals and the solution, then $2 < |z|$.

$$\therefore f(z) = \frac{1}{z^3} \left[\sum_{n=0}^{\infty} \frac{2^n}{z^n} - \sum_{n=0}^{\infty} \left(\frac{1}{z} \right)^n \right]$$

Example: Expand $f(z) = \frac{e^z}{z^2}$ in a Laurent series.

Solution: $f(z)$ is analytic everywhere except the origin. We take C_1 big and C_2 a little smaller.

$$\begin{aligned} f(z) = \frac{e^z}{z^2} &= \frac{1 + z + \frac{z^2}{2!} + \frac{z^3}{3!} + \dots}{z^2} \\ &= \frac{1}{z^2} + \frac{1}{z} + \frac{1}{2!} + \frac{z}{3!} + \dots, \quad 0 < |z| < \infty \end{aligned}$$

Example: Write $f(z) = \frac{\sin z}{z^2 - 1}$ into a Laurent series in powers of $z - 1$.

Solution:

1. Locate the singular points which are $-1, 1$.
2. Leave every factor of the form $z - 1$ in the denominator and otherwise is considered a part of the numerator.

$$\begin{aligned} f(z) = \frac{\sin z}{z^2 - 1} &= \frac{\sin z}{(z-1)(z+1)} \\ &= \frac{\sin z/(z+1)}{z-1} \end{aligned}$$

3. Write Taylor expansion for the new numerator about $z_0 = 1$ and then simplify to get Laurent series,

$$\begin{aligned} \frac{\sin z}{(z+1)} &= \frac{\sin 1}{1+1} + \frac{(\sin z/(z+1))'|_{z=1}}{1!} (z-1) + \frac{(\sin z/(z+1))''|_{z=1}}{2!} (z-1)^2 + \dots \\ f(z) &= \frac{\sin z/(z+1)}{z-1} \end{aligned}$$
