Probability and Statistics

Chapter one : Descriptive Statistics

(1) علم الاحصاء sheet : هو الطريقة العلمية التي تهتم بجمع البيانات والحقائق عن ظاهرة أو فرضية (ظواهر أو فرضيات) معينة، وتنظيم وترتيب وتبويب هذه البيانات والحقائق بالشكل الذي يسهل عملية تحليلها وتفسيرها ومن ثم استخلاص النتائج واتخاذ القرار على ضوء ذلك .

وبشكل عام ان هذا العلم يعتبر وجهه لفرعين رئيسين هما :

(2) الاحصاء الوصفي sheet (Descriptive Statistics)

وهو العلم الذي يتضمن الطرق والاساليب المستخدمة في جمع البيانات والمعلومات عن ظاهرة معينة أو مجموعة من الظواهر، وكيفية تنظيم وتصنيف وتبويب هذه البيانات مع امكانية عرضها في جداول ورسومات بيانية ومن ثم حساب بعض المؤشرات الاحصائية منها .

(ب) الاحصاء الاستدلالي (الاستنتاجي) (Inferential Stat.)

وهو العلم الذي يهتم بموضوعي (التخمين) (Estimation) واختبار الفرضيات (Testing of hypothesis) .

(ج) المجتمع (Population) : هو جميع مفردات أو وحدات الظاهرة تحت البحث، فقد يكون المجتمع مكون من مجموعة من الناس أو مجموعة من منطقة معينة أو وحدات سلع معينة ينتجها معمل معين وهكذا . والمجتمعات على انواع، مجتمعات محددة (finite) تضم عدداً محدوداً من مثل مجموعة التشغيل في بستان معين أو مجتمعات غير محددة تضم عدد غير منتهي مثل عدد النجوم في السماء . وقد يكون المجتمع متماثل اي ان كل مفردة من مفرداته تحمل نفس الصفة مثل فصيلة الدم لدى انسان أو غير متماثل مثل الاطوال والاوزان . وقد يكون المجتمع صغيراً أو كبيراً، ويعتمد على حجم المجتمع . يرمز لحجم المجتمع بالرمز (N) .

(4) العينة (Sample) : هي جزء من المجتمع يجري اختيارها وفق قواعد خاصة لكي تمثل المجتمع تمثيلاً صحيحاً .

العينة العشوائية Random Sample

هي مجموعة وحدات احصائية تختار من المجتمع بحيث أن علي ضوء اسس خاصة. فتؤخذ من كل طبقات المجتمع وبنسبة معينة بحيث تمثل المجتمع تمثيلا صحيحا واي يجب ان تكون عينة متماثلة. ومن فوائد اختيار العينة انها تمثل المجتمع فتقلل بذلك الوقت والجهد والامكانيات المادية.

يرمز لحجم العينة بـ (n).

البيانات (Data) هي المعلومات والارقام والاعداد التي تجمع عن ظاهرة معينة قيد الدراسة مثل اطوال الطلبة للمرحلة الثالثة في قسم الرياضيات في جامعة بغداد.

تبويب البيانات هي عملية ترتيب وتكثيف البيانات الخام التي جمعت عن ظاهرة معينة قيد الدراسة بطرق معينة، لكي تكون هذه البيانات واضحة وسهلة الفهم والوصف لاستخلاص النتائج منها.

البيانات على نوعين ١- بيانات مبوبة Group Data
ببيانات غير مبوبة Ungroup Data

البيانات غير المبوبة (Ungroup Data)

١- مقاييس النزعة المركزية (Measure of Central Tendency)
ب- مقاييس التشتت والاختلاف (Measurement of Variations)

١- مقاييس النزعة المركزية:

هناك بعض القيم تلتف حولها مفردات المجتمع تسمى هذه القيم (بنقاط الوسط) أو (نقاط التركز).. وتدعى هذه النقاط بمقاييس النزعة المركزية ومن اهم هذه المقاييس: الوسط الحسابي، الوسط الهندسي، الوسط الموزون، الوسط التوافقي، الوسط منوفق الهندسي، الوسيط، المنوال.

① الوسط الحسابي (المعدل) (Average): (Arithmetic Mean)

الوسط الحسابي للعينة: $\overline{X}$

لتكن n حجم العينة (عدد مفردات العينة)
X_1 و X_2 و .... و X_n مفردات العينة
$\overline{X}$ تختلف من عينة الى اخرى بتغير مفردات العينة.

$$\overline{X} = \frac{\text{مجموع المفردات}}{\text{عددها}}$$

$$\overline{X} = \frac{\sum_{i=1}^{n} X_i}{n}$$

(٣)

الوسط الحسابي للمجتمع M

لتكن X_1 و X_2 و .... X_n مفردات المجتمع

$$\mu = \frac{\text{مجموع المفردات}}{\text{عددها}}$$

وان M حجم المجتمع (عدد مفردات المجتمع)

$$\mu = \frac{\sum_{i=1}^{N} x_i}{N}$$

ويعتبر M ثابت (معلوم) لان عدد مفردات المجتمع ثابت لا يتغير .

ان الوسط الحسابي $\bar{X}$ او M عندما تكون اوزان المجتمع متساوية .
اما اذا كانت الاوزان غير متساوية فنستخدم (الوسط الحسابي الموزون)

(الوسط الموزون) : (Weighted Mean)

عندما تكون الاوزان لمفردات المجتمع غير متساوية فنستخدم كل مفردة مع وزنها (weight) $= w$ ، ويسمى هذا المقياس بالوسط الموزون او المرجح)

$$\bar{X}_w = \frac{\sum_{i=1}^{n} W_i x_i}{\sum_{i=1}^{n} W_i}$$

x_i مفردات المجتمع

W_i اوزان المجتمع

$i = 1, 2, \ldots, n$

مثال : البيانات الآتية تمثل الدرجات التي يحصل عليها احد الطلبة وعدد الساعات الاسبوعية لكل مادة ، ويطلب ايجاد الوسط الحسابي او معدل درجات هذا الطالب :

الدرجة	80	85	70	78	90	95	65
الساعات الاسبوعية	3	2	4	3	2	3	2

الساعات الاسبوعية تمثل الاوزان ، لذلك نستخدم الوسط الحسابي الموزون :

$$\bar{X}_w = \frac{\sum_{i=1}^{7} w_i x_i}{\sum_{i=1}^{7} w_i} = \frac{3(80) + 2(85) + \cdots + 2(65)}{3 + 2 + \cdots + 2} = 79.95$$

مميزات الوسط الحسابي (Mean)

١- سهولة حسابه .

٢- يدخل في حسابه جميع مفردات المجتمع التي تمثله .

٢- يتأثر بوجود القيم المتطرفة سواء كانت صغيرة ام كبيرة وهذا عيب فيه .

٢- مجموع الانحرافات القيم عن الوسط الحسابي يساوي صفر .

$$\sum_{i=1}^{n} (x_i - \bar{x}) = \text{zero} \qquad (\text{Prove that}).$$

(٣)

② الوسيط (Median)

هو القيمة التي تحتل المرتبة الوسطى بعد ترتيب القيم قيد الدرس (البيانات) ترتيباً تصاعدياً أو تنازلياً .

امثلة

① وسيط مجموعة الارقام 10، 10، 8، 8، 6، 5، 4، 4، 3 . هو 6

② وسيط مجموعة الارقام 18، 15، 12، 11، 9، 7، 5، 5 هو $\dfrac{9+11}{2} = 10$

وبصورة عامة: ان مرتبة الوسيط (R) هي :

$$R = \frac{n+1}{2}$$

وان الوسيط هو القيمة المتوسطة (اذا كان عدد المفردات n فردياً)
وان الوسيط هو متوسط القيمتين الوسيطتين (اذا كان عدد المفردات n زوجياً)

مثال ① اذا كانت البيانات الآتية تمثل الاطوال بالسنتمتر جد الوسيط لها .

110، 106، 113، 116، 102، 114، 111

الحل : نرتب القيم تصاعدياً فنحصل على :

102، 106، 110، 111، 113، 114، 116   (عدد البيانات فردي)
$n = 7$

$R = $ رتبة الوسيط $= \dfrac{n+1}{2} = \dfrac{7+1}{2} = 4$

∴ الوسيط $(M) = 111$ (المرتبة الرابعة)

مثال ② جد وسيط البيانات الآتية :

9، 8، 7، 12، 10، 13، 15، 17

الحل : نرتب المفردات تصاعدياً :

7، 8، 9، 10، 12، 13، 15، 17   (عدد البيانات زوجي)
$n = 8$

$R = $ رتبة الوسيط $= \dfrac{n+1}{2} = \dfrac{8+1}{2} = 4.5$

∴ الوسيط $(M) = $ معدل القيمتين الوسيطتين (المرتبة الرابعة والخامسة)

∴ $M = \dfrac{10+12}{2} = 11$

---

③ المنوال (Mode)

هو القيمة التي تتكرر أكثر من غيرها أو هو القيمة الأكثر شيوعاً وتكراراً بين مجموعة قيم الظاهرة قيد الدرس .
وهناك منوال رئيسي ومنوال ثانوي .
وهناك مجموعة من القيم ذات منوال واحد واخرى ذات منوالين أو قد تكون عديمة المنوال (ليس لها منوال) .

(٤)

امثلة

① مجموعة القيم : 18، 12، 11، 10، 10، 9، 9، 9، 7، 2، 2، 5 .

لها منوال واحد هو (9)

∴ Mo = 9

ⓒ مجموعة القيم : 16، 15، 12، 10، 8، 5، 3 .

ليس لها منوال .

② مجموعة القيم : 9، 7، 7، 7، 5، 5، 5، 4، 4، 3، 2

لها منوالان هما 4، 7 .

---

⑧ ما العلاقة بين الوسط والوسيط والمنوال ؟

م ــ في حالة التوزيعات المتماثلة (المنتظمة) : كالتوزيع الطبيعي ، فان مقاييس النزعة تكون متساوية .

i.e. $M = Mo = Me$

ب ــ في حالة التوزيعات غير المتماثلة (غير المنتظمة) : فان المنوال والوسيط هما الاكثر تمثيلا للتمركز وان :

$$ \frac{\text{الوسط الحسابي} - \text{المنوال}}{\text{الوسيط} - \text{المنوال}} = \frac{3}{1} $$

i.e. $\overline{X} = \dfrac{3Me - Mo}{2}$

ب ــ مقاييس التشتت أو الاختلاف

وهي مقاييس تقيس مدى تشتت القيم المختلفة في ظاهرة طبيعية عن الوسط الحسابي أو مقاييس النزعة المركزية ، ومن هذه المقاييس :
المدى ، التباين ، الانحراف المعياري ، الخطأ المعياري ، معامل الاختلاف ، الانحراف التربيعي .

① المدى : (Range) وهو احد مقاييس التشتت و يمثل الفرق بين القيمة العليا والقيمة الدنيا لمجموعة المفردات .

ومن عيوب هذا المقياس انه لا يهتم سوى بمفردتين فقط هي القيمة العليا والدنيا ونتيجة لذلك لا يهتم بالاختلافات الموجودة بين المفردات الباقية ، فهو لا يهتم بحجم العينة فلا يمكن استخدامه كمقياس للمقارنة بين العينات عند اختلاف حجم العينة . ومن ناحية اخرى قد تكون القيم المتطرفة هي القيم العليا أو الدنيا وهذا عيب كبير وبذلك لا يعتبر هذا المقياس كفوئ كلما زاد عدد مفردات العينة .

المدى (Range):

$$R = L - U$$

↑ أقل قيمة   ↑ أكبر قيمة

هو الفرق بين آكبر قيمة وأصغر قيمة من قيم الظاهرة (المفردات).

أمثلة

① جد مدى البيانات الآتية:

45، 50، 55، 60، 65

$$R = L - U = 65 - 45 = 20$$

② مدى البيانات الآتية (الأوزان):

45، 100، 55، 45، 95، 50 كغم

$$R = 45 - 100 = 55 كغم$$

---

③ التباين والانحراف المعياري (Variance & Standard Deviation)

ان مقاييس التشتت (المدى) تقيس مدى اقتراب أو ابتعاد القيم للعينة (المفردات) عن نقطة التمركز (الوسط الحسابي وغيره).. فكل مشكلة الاختلافات هو وجود في مفردات العينة أو المجتمع، نستخدم مقاييس الوسط الحسابي لكن المشكلة في ان مجموع انحرافات القيم عن الوسط الحسابي = صفر، ولغرض التخلص من القيم السالبة في الانحرافات، طرأت فكرة تربيع هذه الانحرافات ليدل على مدى الاختلافات ولأجل التخلص من مشكلة اخرى هي حجم المجتمع أو العينة، تم القسمة على عدد القيم التي بوزن (S²) وتقرأ (سكما سكوير) للعينة، اما المجتمع فان وزن (σ²):

صيغة تباين المجتمع:

$$\sigma^2 = \sum_{i=1}^{N} \frac{(x_i - \mu)^2}{N-1}$$

اما صيغة تباين العينة:

$$S^2 = \sum_{i=1}^{n} \frac{(x_i - \bar{x})^2}{n-1}$$

وان استخدام (n-1) بدلاً من (n) الذي هو حجم العينة يعود الى اعتبارات رياضية تتعلق بالتقديرات غير المتحيزة وتسمى (n-1) بدرجات الحرية (degree of freedom).

اما الانحراف المعياري (Standard deviation): هو الجذر التربيعي للتباين

الانحراف للمجتمع $\sigma = +\sqrt{\sigma^2}$

الانحراف للعينة $S = +\sqrt{S^2}$

مثال) جد التباين للقيم الآتية التي تمثل وزن اللحم الصافي لستة رؤوس من الغنم .. تمثل مجتمعاً قائماً بذاته :

$$35 \ , \ 34 \ , \ 40 \ , \ 38 \ , \ 37 \ , \ 32 \quad (\text{كغم})$$

sol.

الوسط الحسابي للمجتمع

$$\mu = \frac{35+34+40+38+37+32}{6} = \frac{216}{6} = 36 \ \text{كغم}$$

(تباين المجتمع) ويعني تباين كل قيمة عن الوسط الحسابي μ للمجتمع .

$$\sigma^2 = \sum_{i=1}^{6} (x_i - 36)^2 / 6-1 = \frac{42}{5} = 8.4 \ (\text{كغم}^2)$$

(نفس المثال اعلاه لكن للعينة)

الوسط الحسابي للعينة

$$\bar{X} = \frac{35+34+\cdots+32}{6} = 36 \ \text{كغم}$$

(تباين العينة)

$$S^2 = \sum_{i=1}^{6} (x_i - 36)^2 / 6$$

$$= \frac{42}{5} = 8.4$$

البيانات المبوبة (Group Data)

١- مقاييس النزعة المركزية ← مقاييس التشتت والاختلاف .

٢- مقاييس النزعة المركزية :

① الوسط الحسابي :

$$\bar{X} = \frac{\sum_{i=1}^{k} x_i f_i}{\sum_{i=1}^{k} f_i}$$

x_i = يمثل مركز الفئة i
f_i = يمثل تكرار الفئة i
k = يمثل عدد الفئات .

② الوسيط : لديجاد الوسيط نتبع الخطوات الآتية :
ⓐ ترتيب الفئات تصاعدياً ثم ايجاد التكرار المتجمع الصاعد .
ⓑ ايجاد رتبة الوسيط بالصيغة :

$$R = \frac{\sum f_i + 1}{2} = \frac{n+1}{2}$$

ⓒ تحديد الفئة الوسيطية من خلال مقارنة رتبة الوسيط وموقعها في أول تكرار متجمع صاعد .
ⓓ نستخدم الصيغة التالية في ايجاد الوسيط :

$$Me = Le + \frac{R - G_1}{G_2} \times We$$

حيث ان :

(٧)

Le = الحد الأدنى للفئة الوسيطية

We = طول الفئة الوسيطية

G_1 = التكرار المتجمع الصاعد للفئة قبل الوسيطية

G_2 = تكرار الفئة الوسيطية .

③ المنوال : لايجاد المنوال يجب تحديد الفئة المنوالية أولاً وهي الفئة التي تقابل أكبر تكرار ونستخدم الطريقة الآتية :

حيث أن :

$$M_o = Lo + \frac{D_1}{D_1 + D_2} \times Wo$$

Lo : الحد الأدنى للفئة المنوالية

D_1 : الفرق بين تكرار الفئة المنوالية وتكرار الفئة قبل المنوالية .

D_2 : الفرق بين تكرار الفئة المنوالية وتكرار الفئة بعد المنوالية .

Wo : طول الفئة المنوالية .

ب - مقاييس التشتت والاختلاف :

① المدى :

حيث أن :

$$R = X_L - X_S$$

X_L = الحد الأعلى للفئة الأخيرة

X_S = الحد الأدنى للفئة الأولى

② الانحراف المعياري والتباين :

ليكن :

$Var(X) = S^2$ = التباين

$S = \sqrt{S^2}$ = الانحراف المعياري

f_i = التكرار المقابل لمركز لفئة x_i

x_i = مركز الفئة = $\left(\dfrac{\text{الحد الأعلى للفئة} + \text{الحد الأدنى للفئة}}{2} \right)$

K = عدد الفئات

التباين $$\delta^2 = \frac{\sum_{i=1}^{k} f_i x_c^2}{\sum_{i=1}^{k} f_i - 1} - \frac{\left(\sum_{i=1}^{k} f_i x_c\right)^2}{\sum f_i (\sum f_i - 1)}$$

H.W. جد الوسط والوسيط والمنوال للبيانات الآتية :

Classes	frequency (f_i)	x_c (Mid Point)	$x_i f_i$	c.f. (التكرار المتجمع الصاعد)
25 - 35	2	?	?	?
35 - 45	5			
45 - 55	12			
55 - 65	13			
65 - 75	20			
75 - 85	15			
85 - 95	8			
95 - 1.5	5			

(٨)

مثال: جد الوسط (Mean) والوسيط (Median) والمنوال (Model)
والتباين (Variance) والانحراف المعياري (S.d.) والمدى (Range)
لطول النباتات، والنتيجة:

Classes	f_i	x_i	$x_i f_i$	c.f.
2 – 4	3	3	9	3
4 – 6	5	5	25	8
6 – 8	2	7	14	⑩ يساوي عدد القيم $n = \Sigma f_i = 10$

$$n = \Sigma f_i = 10 \;,\; \Sigma x_i = 15 \;,\; \Sigma x_i f_i = 48$$

$$\overline{X} = \frac{\Sigma f_i x_i}{\Sigma f_i} \sim \overline{X}_w \qquad (Mean)$$

$$Me = Le + \frac{R - G_1}{G_2} \times we \qquad (Median)$$
$$= 4 + \frac{5.5 - 3}{5} \times 2 = 5 \in (4-6) \quad \text{الفئة المنوالية}$$

$$Mo = Lo + \frac{D_1}{D_1 + D_2} \times W_o \qquad (Mode)$$
$$= 4 + \frac{(5-3)}{(5-3)+(5-2)} \times (2)$$
$$= 4 + \frac{(2)(2)}{2+3} = 4 + \frac{4}{5} = \frac{24}{5} = 4.8$$

$$R = X_L - X_S = 8 - 2 = 6 \qquad (Range)$$

$$\delta_x^2 = \frac{\Sigma x_i^2 f_i}{\Sigma f_i - 1} - \frac{(\Sigma x_i f_i)^2}{\Sigma f_i (\Sigma f_i - 1)} \qquad (Variance)$$

كذلك نطبق القانون،

x_i	x_i^2	$x_i f_i$	$x_i^2 f_i$	f_i
3	9	9	27	3
5	25	25	125	5
7	49	14	98	2

$\Sigma f_i = 10$
$\Sigma f_i - 1 = 9$
$\Sigma x_i f_i = 48$
$\Sigma x_i^2 f_i = 205$
$(\Sigma x_i f_i)^2 = (48)^2 = 2304$

(٩)

الارتباط والانحدار
Correlation and Regression

~~~~~~~~~~~~~~~~~~~~

الارتباط (Correlation)

هو العلاقة التي تربط بين ظاهرتين أو أكثر، وهو على انواع منها:
الارتباط البسيط، الارتباط المتعدد، الارتباط الجزئي.

الارتباط البسيط (Simple Correlation)

لمعرفة العلاقة بين ظاهرتين X و Y ونوع هذه العلاقة، نستخدم مؤشراً احصائياً يدعى (معامل الارتباط البسيط) (Simple Correlation Coefficient) حيث ان Y يمثل المتغير المعتمد (التابع) و X هو المتغير المستقل. ويرمز لهذا المعامل بالرمز (r) حيث

$$-1 \leq r \leq +1$$

تعني الاشارة السالبة ان العلاقة بين الظاهرتين عكسية وضعيفة. اما الاشارة الموجبة ان العلاقة بين الظاهرتين طردية وقوية. والصيغة لهذا المعامل،

$$r_{x,y} = \frac{n\sum xy - \sum x \sum y}{\sqrt{[n\sum x^2 - (\sum x)^2][n\sum y^2 - (\sum y)^2]}}$$

حيث ان n تمثل حجم العينة = عدد البيانات في كل عمود (عدد بيانات X = عدد بيانات Y)

$$\text{If} \quad r_{x,y} \in (0,1] \longrightarrow \text{معامل ارتباط قوي}$$
$$\text{If} \quad r_{x,y} \in [-1,0) \longrightarrow \text{معامل ارتباط ضعيف}$$
$$\text{If} \quad r_{x,y} = 1 \longrightarrow \text{معامل ارتباط تام}$$
$$\text{If} \quad r_{x,y} = 0 \longrightarrow \text{لا يوجد ارتباط بين X و Y}$$

معامل ارتباط طردي

معامل ارتباط عكسي

$r = 0$
لا توجد علاقة بين X و Y

Note: $r_{x,y} = r_{y,x}$

(10)

اما معامل الارتباط البسيط للمجتمع :

$$\rho_{x,y} = \frac{N\Sigma XY - (\Sigma X)(\Sigma Y)}{\sqrt{N\Sigma X^2 - (\Sigma X)^2][N\Sigma Y^2 - (\Sigma Y)^2}}$$

مثال : صممت تجربة لدراسة تأثير زيارة جرعة منوم معين في وقت النوم وتم تكوين ثلاث قراءات لكل من المستويات الثلاثة للجرعة ، والمطلوب معرفة اذا كانت هناك علاقة بين الجرعة ووقت النوم

الجرعة (Y)	وقت النوم (X)	XY	X²	Y²
3	4	12	16	9
3	6	18	36	9
3	5	15	25	9
10	9	90	81	100
10	8	80	64	100
10	7	70	49	100
15	13	195	169	225
15	11	165	121	225
15	9	135	81	225
84	72	780	642	1002

$$r_{x,y} = \frac{9(780) - (72)(84)}{\sqrt{[9(642) - (72)^2][9(1002) - (84)^2]}} = \frac{972}{1079.55}$$

$$= 0.9 \in (0,1]$$

∴ العلاقة قوية وطردية بين الجرعة ووقت النوم

ملاحظة : اذا كانت كلا الظاهرتين غير قابلة للقياس ، نستطيع ايجاد العلاقة بين الظاهرتين باستخدام (معامل الارتباط لسبيرمان) ، وذلك باعطاء رتب لكل القيم أما البيانات غير قابلة للقياس ثم نستخدم الصيغة الآتية .

$$r = 1 - \frac{6\Sigma D_i^2}{N(N^2-1)}$$

(معامل سبيرمان للرتب)

D_i : تمثل فرق رتب لكل زوج

N : تمثل عدد القيم الغير قابلة للقياس (الغير كمية)

مثال جد العلاقة بين درجة الطالبين A و B من البيانات الآتية:

A	B	$D_i (A-B)$	D_i^2
جيد (4)	مقبول (2)	2	4
مقبول (2)	جيد جداً (5)	-3	9
ضعيف (1)	مقبول (2)	-1	1
جيد (4)	متوسط (3)	1	1
جيد جداً (5)	جيد (4)	1	1
جيد (4)	متوسط (3)	1	1

* نرتب اولاً تصاعدياً ثم نعطي رتب

(1) ضعيف
(2) مقبول
(3) متوسط
(4) جيد
(5) جيد جداً

$N = 6$ (عدد البيانات)

$\sum D_i^2 = 17$

$$r_{A,B} = 1 - \frac{6 \cdot \sum D_i^2}{N(N^2-1)} = 1 - \frac{6 \cdot (17)}{6(6^2-1)}$$

$$= 0.51 \in (0,1] \quad (\text{العلاقة قوية وطردية})$$

مثال آخر (H.W)

A	B	D_i	D_i^2
متوسط (3)	جيد جداً (5)	-2	4
ضعيف (1)	متوسط (3)	-2	4
جيد (4)	مقبول (2)	2	4
متوسط (3)	جيد جداً (5)	-2	4
جيد جداً (5)	متوسط (3)	2	4

$N = 5$, $\sum D_i^2 = 20$

$$r_{A,B} = 1 - \frac{6(20)}{5(5^2-1)} = ?$$

* ما نوع العلاقة بين A و B؟

(13)

Regression الانحدار

شكل الانتشار: (Scatter diagram)

هو كل زوج من أزواج القيم التي تمثل متغيراتها بين متغيرين متعامدين وعلى شكل نقاط (points)

وهذا الشكل في اغلب الاحيان يمثل علاقة دالية وذات اتجاه مستقيم (دالة خطية)

خط الانحدار (Linear Regression)

هو الخط الذي يمر بأكبر عدد ممكن من نقاط في شكل الانتشار

اما معادلة خط الانحدار فهي:

حيث ان:

$$ y = \alpha + \beta X + e $$

α : هي المسافة بين نقطة تقاطع خط الانحدار مع المحور Y ونقطة الاصل .

β : هي ميل خط الانحدار أو ظل الزاوية التي يصنعها خط الانحدار مع محور X .

$$ i.e. \quad \beta = \tan\theta \implies \theta = \tan^{-1}\beta $$

e : هو الخطأ الذي يمثل الفرق بين القيمة الحقيقية والتقديرية لـ Y

(تُقرأ ∧ بـ hat)

$$ i.e. \quad e_i = Y_i - \hat{Y}_i $$
$$ if \quad e_i = 0 \implies Y_i = \hat{Y}_i $$

اما المعادلة التقديرية المستخدمة لحساب خط الانحدار هي:

$$ \hat{Y} = \hat{\alpha} + \hat{\beta} X $$

حيث ان :

$\hat{Y}$: القيمة التقديرية لـ Y .

$\hat{\beta}$: القيمة التقديرية لـ β .

$\hat{\alpha}$: القيمة التقديرية لـ α .

نحسب الدالة لـ Y . حيث يكون الخطأ e اقل ما يمكن ويمكن حساب قيمة $\hat{\alpha}$ و $\hat{\beta}$ باستخدام طريقة المربعات الصغرى في الحساب (Least Square) .

ثم تسمى (معامل الانحدار) حيث ان ($\hat{\beta}=0$) يعني لا توجد علاقة بين X و Y واذا كانت $\hat{\beta}$ قيمة سالبة يعني ان العلاقة عكسية بين X و Y واذا كانت $\hat{\beta}$ قيمة موجبة يعني ان العلاقة بين X و Y طردية .

ليكن : $X = $ mean of X & $\overline{Y} = $ mean of Y فان :

(١٣)

لإيجاد $\hat{\alpha}$ و $\hat{\beta}$ باستخدام طريقة المربعات الصغرى، حيث أن $r_{x,y}$ يمثل (معامل الارتباط البسيط) وأن δ هو الانحراف المعياري:

$x \mid y$	$y \mid x$
$\hat{\beta} = \dfrac{n\Sigma xy - \Sigma x\, \Sigma y}{n\Sigma x^2 - (\Sigma x)^2}$	$\hat{\beta} = \dfrac{n\Sigma xy - \Sigma x\, \Sigma y}{n\Sigma x^2 - (\Sigma x)^2}$
$= \dfrac{\delta x}{\delta y} \cdot r_{x,y}$	$= \dfrac{\delta y}{\delta x} \cdot r_{x,y}$
$\hat{\alpha} = \overline{x} - \hat{\beta}\, \overline{y}$	$\hat{\alpha} = \overline{y} - \hat{\beta}\, \overline{x}$

<u>ملاحظة</u> ان مفهوم الانحدار الخطي على صلة وثيقة بمفهوم الارتباط الخطي، حيث ان الانحدار يقدر العلاقة الخطية بين المتغيرات اما الارتباط الخطي فهو يصف العلاقة بين المتغيرات (يصف لعلاقة نفسها).

<u>مثال (1)</u> اجريت احدى التجارب لدراسة تأثير عقارمعين في تخفيض دقات القلب لغير البالغين، حيث ان المتغير المستقل (X) يمثل الجرعة بالملغم من العقار والمتغير المعتمد (Y) يمثل الانخفاض في دقات القلب (دقة / الدقيقة).

① ارسم شكل الانتشار ③ جد معادلة خط الانحدار التقديرية.

② جد مقدار الانخفاضات في دقات القلب عندما تكون الجرعة (2) ملغم.

④ لايجاد معادلة خط الانحدار التقديرية:

X	Y	X^2	XY	
0.5	10	0.25	5	$\hat{\beta} = \dfrac{(8)(152.5) - 11(102)}{8(17.75) - (11)^2}$

① جد تباين القيم التالية التي تمثل وزن اللحم الصافي لستة رؤوس من الغنم وتشكل قائمة بذاته:

35، 34، 40، 38، 37، 32 (كغم)

$$\delta_x^2 = \sum_{i=1}^{6} (x_i - \mu_x)^2 / N$$

(5)

$$\mu_x = \frac{35+34+40+38+37+32}{6} = 36$$

$$\delta^2 = \sum_{i=1}^{6}(x_i-36)^2/6 = \frac{42}{6} = 7 \text{ (كغم}^2)$$

اي ان تباين كل قيمة عن الوسط الحسابي للمجتمع μ_x هو (7) كغم².

نفس السؤال اعلاه لكن للعينة:

$$\bar{X} = \frac{35+34+\cdots+32}{6} = 36 \text{ كغم}$$

$$S^2 = \sum_{i=1}^{n}(x_i-\bar{X})^2/n-1 = \sum_{i=1}^{6}(x_i-36)^2/5$$

$$= \frac{42}{5} = 8.4 \text{ (كغم}^2)$$

Probability and Statistics

الاحتماليــــة والاحصـــــاء

Chapter Two : Introduction to Probability

<u>Def :-</u> A random (Statistical) experiment is an experiment with :-

1. All out comes (results) of the experiment are known in advance

2. Any performance of the experiment results in an out comes is not known in advance .

3. The experimant can be repeated under the identical conditions .

ويمكن تعريف التجربة العشوائية بأنها تلك التجربة التي ينتج عنها مجموعة من الاحـــداث كل حدث منها مستقل عن الاخر وان وقوع ذلك الحدث يرجع الى عامل الصدفة وحـــــده (لا يمكن التنبؤ بحدوثه)

ملاحظة: ستطرق الى جملة من التجارب كأمثلة تساعدنا في تفسير بعض المفاهيم مثل :

1. Tossing a coin   تجربة رمي العملة

2. Rolling adice   تجربة رمي الزار

3.Playing cards   تجربة ورق اللعب

وهكذا

Def: (Sample Space)

A sample space of an experiment is a set of all possible outcomes denoted by (S)

فضاء العينة : هو كل النتائج المحتملة من تجربة عشوائية معينة.

Def: (Events)

Any events is a (proper) subset of a sample space

الحوادث: هي مجموعه جزئيه من(S) ويكون الحادث بسيطاً اذا تكون من عنصر واحد

فقط او مركب اذا تكون من اكثر من عنصر ومستحيلاً اذا لم يحوي على اي عنصر

واكيداً اذا احتوى على عناصر(S) جميعا

ie: If A is an Event, then $A \subseteq S$

ex: Toss a coin once

sol. S={ H,T }

S has (2) elts since acoin has two faces

Let A: to get H

$A = \{H\} \subseteq S$

Let B: to get T

$B = \{T\} \subseteq S$

∴ A and B are Events

ex: Roll adice once

a dice has (6) faces

each face has adots

$S = \{1,2,3,4,5,6\}$

$= \{d : 1 \leq d \leq 6\}$

A: To get one odd no.

$A = \{1,3,5\} \subseteq S$

A is an Event

B: To get one even no.

$B = \{2,4,6\} \subseteq S$

$\therefore$ B is an event

C: $d \leq 3$

$C = \{1,2,3\} \subseteq S$

$\therefore$ C is an Event

ملاحظة : سيكون فضاء العينة في هذا الفصل من النوع المنتهي والقابل للعد .

Def:- Empty set (Φ) الحادثة التي لا تحدث

Φ is an Impossible event

ex Toss a dice once

Let A: to get 7

$\therefore A = \Phi$

Def :- (Disjoint events) الحوادث المنفصلة

If A and B are events, then A and B are disjoint iff $A \cap B = \Phi$

$AB = \Phi$ $AB = \Phi$

Def. (Joint events) الحوادث المتصلة

If A and B are event , then A and B are Joint iff $A \cap B \neq \Phi$

S

$B \subset A$
$AB = B$

S

AB

Note :- We shall use the symbol (AB) to denote of $A \cap B$

Def :- If A and B are events , then $(A \cup B)$ & $(A \cap B)$, $(A - B)$, (B / A) $A^{C} \cdots etc$ are also events .

$A^{c} = S/A = S - A$

ex. Roll a dice once .

Let

$A = \{d : d \geq 2\} = \{2,3,4,5,6\}$
$B = \{d : d \leq 3\} = \{1,2,3\}$
$C = \{d : d \leq 1\} = \{1\}$

Find $A \cup B$, $A \cap B$, $A \cup C, \cdots$

A^{c} , B^{c} , AB^{c} , BA^{c} , ...

$AB = \{x ; x \in A \wedge x \in B\} \subseteq S$
$A \cup B = \{x ; x \in A \vee x \in B\} \subseteq S$
$A - B = \{x ; x \in A \wedge x \notin B\} \subseteq S$
$B - A = \{x ; x \in B \wedge x \notin A\} \subseteq S$

$A \cup B - AB$

$A \cup B = \{1,2,3,4,5,6\}$

$A \cap B = \{2,3\}$

$A^c \cup C = \{1,2,3,4,5,6\}$

$A^c = \{1\}$

$B^c = \{4,5,6\}$

$AB^c = \{4,5,6\}$

$BA^c = \{1\}$

Toss a coin twice (2- time)

When toss a coin twice (2-time)

$$S = \{HH, HT, TH, TT\}$$

S has ($2^2 = 4$) etls

When toss a coin three-times

$$S = \{HHH, HHT, HTH, HTT \cdots, TTT\}$$

$\therefore$ S has ($2^3 = 8$) elts

when toss a coin n-times , then the sample space (S) has 2^n elts

ex. Roll a dice twice (2-times)

$$S = \{(d_1, d_2); 1 \leq d_1 \leq 6; 1 \leq d_2 \leq 6\}$$

S= has ($6^2 = 36$) elts

When roll a dice n-times , then the sample space (S) has (6^n) elts

Simple Probability الاحتمالية البسيطة

Def:- If A be an events , P(A)= probability of event A = Pr.(A) that is mean (pr) that event A happence . If S has (n) elts & A has (m) elts , then

$$p(A) = \frac{\text{no. of elts of event A}}{\text{no. of elts of S}} = \frac{|A|}{|S|} = \frac{m}{n}$$

ملاحظة : عند احتساب الاحتمال الرياضي لاي حادثة يجب ان تتوفر الحالة التي تكون فيها الاحداث مستبعدة لبعضها الاخر وان كل حدث ياخذ الفرصة التي تاخذها الاحـــداث الاخرى في الوقوع .

ويعرف احتمال الحصول على صفة معينة (حادثة معينة) مثل (A) من تجربة عشوائية معينة بأنه عدد مرات حدوث الصفة (A) مقسوما على الحالات المتوقعة .

ملاحظة : نجد ان قيمة الاحتمال هي عبارة عن دالة (تطبيق) P مجالها (منطلقــها) S ومداها $R_{[0,1]}$

$$P: S \to R_{[0,1]}$$

تسمى دالة الاحتمال P دالة احتمال منتظم اذا اعطى نفس القيمة الاحتمالية لكل عنصـــر من عناصر فضاء العينة .

ملاحظة: نجد ان قيمه الاحتمال تعتمد بالدرجة الاساس على معرفة كل الحالات الممكنـــة لـ(S) وان هذه الحالات يمكن حصرها بسهوله في الحالات البسيطة ولكن عند زيـادة

عدد الاحداث يؤدي الى وجود صعوبة في تحديد عدد الحوادث الممكنة ولذلك لابـد مـن اللجوء الى بعض الطرق الرياضية التي تساعد في تحديد مثل هذه الحـــالات ومـــهما زاد عددها واهم هذه الطرق

1. permutation التباديل

وهي عملية ترتيب n من الاشياء في مجاميع كل منها يتالف من r من الاشياء وحسب القاعدة التالية

$$P_r^{n} = P_{n,r} = \frac{n!}{(n-r)!}$$

$$P_r^{n} = P_{n,r} = \frac{n!}{(n-r)!}, n, r \in I^{+}$$

مثال/ جد عدد الطرق الممكنة لترتيب اربع كرات مرقمة من 1-4

$$P_4^{4} = \frac{4!}{(4-4)!} = \frac{4!}{0!} = 4 \times 3 \times 2 \times 1 = 24 \text{ or } 4! = 4 \times 3 \times 2 \times 1 = 24$$

مثال / جد عدد الطرق الممكنة التي يمكن وضع خمس كرات في صندوقين بحيث ان كـل صـندوق يحتوي على كرة واحدة فقط

$$P_2^{5} = \frac{5!}{(5-2)!} = \frac{5!}{3!} = \frac{5 \times 4 \times 3!}{3!} = 20 \text{ samples}$$

في حالة وجود مكررات في مفردات المجموعة فان عدد الطرق الممكنة للـترتيب يمكـن حسـابها بالطريقة التالية :

$$P_{n1,n2 \cdots nk}^{n} = \frac{n!}{n_1! n_2!, \cdots n_k!}$$

where $n = n_1 + n_2 + \cdots + n_k$

مثال / جد عدد الطرق الممكنة لترتيب سبع كرات اربعة منها بيضاء واثنان حمراء والباقي الــوان اخرى .

$$P^7_{4,2,1} = \frac{7!}{4!2!1!} = 105 \text{ Methods}$$

2. Combination التوافيق

هي عملية اختيار او انتخاب (Selection) عدد من المفردات بحجم r من مجموعة كبيرة بحجم n وبدون ترتيب وتستخدم الصيغة التالية :

$$\binom{n}{r} = \left(\frac{n}{r} = \frac{n!}{r!(n-r)!}, n, r \in I^+\right.$$

مثال / ما هو عدد العينات التي يمكن تكوينها من مجتمع مؤلف من ست مفردات بحيــث يكون حجم العينة مفردتين اثنين فقط .

$$\binom{6}{2} = \frac{6!}{2!(6-2)!} = \frac{6!}{2!4!} = \frac{6 \times 5 \times 4!}{2!4!} = 15 \text{ samples.}$$

مثال / ما هو عدد اللجان التي يمكن تأليفها من اربعة افراد بحيث ان كل لجنة تحتـوي على أ. فردين اثنين   ب. ثلاثة افراد

$$\binom{4}{2} = \frac{4!}{2!(4-2)!} = \left(\frac{4!}{2!2!}\right) = \frac{24}{2} = 6$$

$$\binom{4}{3} = \frac{4!}{3!(4-3)!} = \frac{4!}{3!} = 4$$

ملاحظة : هناك علاقة بين التباديل والتوافيق وهي :

$$\binom{n}{r} = \frac{P^n_r}{r!},$$

<div align="center">Binomial theorm نظرية ذات الحدين</div>

$$(a+b)^n = \sum_{r=0}^{n}\binom{n}{r}a^{n-r}b^{r}$$

binomial coefficients معادلات ذات الحدين

$$= a^n + n\,a^{n-1}b + \frac{n(n-1)}{1-2}a^{n-2}b^2 + \cdots + b^n$$

Axioms of Probability : بديهيات الاحتمالية

1. If $A \subseteq S$, then $0 \leq P(A) \leq 1$

2. $P(S) = 1$

3. If $A_1 A_2, \cdots A_n, \cdots$ are sequence of disjoint events , then

$$P(A_1 \cup A_2 \cup \cdots \cup A_n \cdots) = P(A_1) + P(A_2) + \cdots + P(A_n) \cdots$$

ie. $P\left(\bigcup_{i=1}^{\infty} A \right) = \sum_{i=1}^{\infty} P(Ai)$

Note:- Special case of Ax.3

If A and B are disjoint events , then $P(A \cup B) = P(A) + P(B)$

Random Sampling العينات العشوائية

Suppose a population of n-elts $(a_1, a_2, \ldots \ldots a_n)$ We want to choose a

subset of this population has (K) elts $(a_1, a_2, \ldots \ldots a_k)$ at random $(k \le n)$

These subset is called random samples . there are tow kinds of random

sample :-

1. Un Ordered Sample العينات غير المرتبة

Select (k) elts from (n) elts at once (at the same time)

2. Ordered Sample العينات المرتبة

a. one by one without replacement selecte (k) elts. From (n) elts .

one by one without repl .

b. one by one with replacement selecte (k) elts , From (n) elts.

one by one with replac .

<u>Case 1 الحالة الاولى</u>

Choose (k) elts . at the same time from (n) elts .

We use , (combination n , K) to find the number of all samples

$$\binom{n}{k} = \frac{n!}{k!(n-k)!}$$

Ex/ Given a set of (4) elts. $\{a, b, c, d\}$

Choose a sample of (2) elts.

a. Find the sample space of all samples .

b. Find the pro. That a sample has elts . (b)

Sol/ a.

$$\binom{4}{2} = \frac{4!}{2!(4-2)!} = \frac{4 \times 3 \times 2!}{2! \times 2!} = \frac{12}{2} = 6 \text{ samples}$$

$$S = \{(a,b),(a,c),(a,d),(b,c),(b,d),(c,d)\}$$

b. Let A be a sample has elts (b)

$$A = \{(a,b),(b,c),(d,d)\}$$

$$\therefore P(A) = \frac{3}{6} = \frac{1}{2}$$

Probability Space

Def :- (σ-Field)

A non-empty collection $\wp$ subsets of a set (S) is called σ -field of subsets of (S) provided the following two properties holds .

1. If $A \in \wp$, *then* $A^c \in \wp$

2. If $A_n \in \wp$, $n = 1,2,\ldots$

then $\bigcap_{n-1}^{\infty} A_n \wp \ \& \ \bigcup_{n-1}^{\infty} A_n \in \wp$

Def:- A probability measure (p) on a (δ) -field of subsets $(\wp)$ is a real valued function having a domain $(\wp)$ and satisfying the following properties

1. $P(S) = 1$

2. $P(A) \geq 0, \forall A \in \wp$

3. If $A_1, A_2, \ldots\ldots A_n$, are disjoint in $\wp$ then

3. If $P(A) = \frac{1}{3}$ & $P(B) = \frac{1}{2}$. Find the value of $P(BA^c)$ when :

a. A & B are disjoint events
b. $A \subseteq B$

c. $P(AB) = \frac{1}{8}$

$A \subseteq B$

Sol.

2

a. If A and B are disjoint.

∵ A, B are disjoint

$P(B \cap S) = P(B) = \frac{1}{2}$

b. If $A \subseteq B$

$B = A \cup BA^c$

where A & BA^c are disjoint events.

$P(B) = P(A) + P(BA^c)$ (By Ax. 3)

$\frac{1}{2} = \frac{1}{3} + P(BA^c)$

$P(BA^c) = \frac{1}{2} - \frac{1}{3} = \frac{1}{6}$

c. $P(AB) = \frac{1}{8} \Rightarrow P(AB) \neq 0 \Rightarrow AB \neq \emptyset$ (By Th. 1).

$B = AB \cup BA^c$ (when AB & BA^c are disjoint events)

$P(B) = P(AB) + P(BA^c)$ (By Ax. 3)

$\frac{1}{2} = \frac{1}{8} + P(BA^c)$

$\Rightarrow P(BA^c) = \frac{3}{8} \in [0,1]$

4. If A, B and C are disjoint events, find:

1. $P[(A \cup B) \cap C] = P[AC \cup BC] = P(\emptyset \cup \emptyset)$ (since $AB = \emptyset$
$AC = \emptyset$
$BC = \emptyset$
A, B, C are disj.)
$= P(\emptyset)$ (By Th. 1)
$= 0$

2. $P(A^c \cup B^c) = P[(AB)^c] = P(\emptyset)^c = P(S) = 1$
(By Demo. Lows)   BY $AB = \emptyset$ (By Ax. 2)
(A, B are disj. events)

How many 5-cards will have 3 hearts and 2 spaces?

↑ hearts(♡) ↑ spaces (♠)

Note: Ace (A), Heart (♡), Club (♣), Diamond(♢), Spade♠

Jack (J), Queen (Q), King (K) = the face cards (pic.)صورة

These are standard deck of (52) cards has four suits &
♡, ♣, ♢, ♠ with (13) cards in each suit.

Example ②:

✓ Let E = the drawn card is a spade(♠).
   F = the drawn card is a face card. (صورة)

Let G = the drawn card is a heart (♡).
   H = the drawn card is a club (♣).

① Are E & F independent events?
② Are G & H independent events?

sol. ① $P(E) = \left(\frac{13}{52}\right)$, $P(F) = \left(\frac{12}{52}\right)$

$$P(E \cap F) = P(J♠, Q♠, K♠) = \frac{3}{52}$$

$$P(E \cap F) = \frac{3}{52} = P(E) P(F) = \left(\frac{13}{52}\right) \cdot \left(\frac{12}{52}\right) = \frac{3}{52}$$

Then E & F are indep. events.

② $P(G) = \frac{13}{52}$, $P(H) = \frac{13}{52}$, $G \cap H = \emptyset$

∴ $P(G \cap H) = P(\emptyset) = 0$ (by Th.1)

$P(G) P(H) = (\frac{13}{52})(\frac{13}{52}) = \frac{1}{16} \neq P(G \cap H) = 0$

Ⓐ E = the drawn card is a red card.
     F = the drawn card's number is divisible by 5.

Ⓑ G = the drawn card is a king.
     H = the drawn card is a queen.

① Are E & F indep. events?
② Are G & H indep. events?   (H.W.)

Example (4): In a single card is drawn from a standard 52-card deck. Find the Pr. of each of the following events.

① $P(\text{ace}) = \frac{4}{52}$

Example (1): If a coin is tossing twice.

$S = \{HH, HT, TH, TT\}$

A = ahead on the first toss = $\{HH, HT\}$

B = ahead on the second toss = $\{HH, TH\}$

Are A & B independent events?

sol. $P(A) = \frac{2}{4} = \frac{1}{2}$, $P(B) = \frac{2}{4} = \frac{1}{2}$

$AB = \{TH\} \rightarrow P(AB) = \frac{1}{4}$

$P(A)P(B) = \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4} = P(A \cup B)$

so A & B are indep. events.

Example (2): Roll a die once.

Find the pr. that:

E_1: The die shows an event number.

E_2: The die shows a (1).

E_3: The die shows a multiple of (3) = $\{3, 6\}$

E_4: The die shows a number less than (5) = $\{1, 2, 3, 4\}$

E_5: The die shows a number (7) = ϕ

E_6: The die shows a number less than (10).

(H.W.)

Example (3): Rolling a die twice. Find the pr. that the sum of the numbers rolled is greater than (3).

sol. $P(\text{sum} > 3) = ?$

$P(\text{sum} \leq 3) = P(\text{sum is } 2) + P(\text{sum is } 3)$

$\{(1,1)\}$ $\{(2,1), (1,2)\}$

so $P(\text{sum} > 3) = 1 - P(\text{sum} \leq 3)$ (by Th. $P(A) = 1 - P(\bar{A})$)

$= 1 - \frac{1}{12} = \frac{11}{12}$.

Example (4): Suppose that two dice are rolled.
(A) what is the pr. that a sum of (7) or (11) turns up? (مختلفة)
(B) what is the pr. that both dice turn up the same or that a sum less than (5) turns up?

sol.

$B = \{ (5,6), (6,5) \} \rightarrow n(B) = 2$
$n(S) = 6^2 = 36$, $AB = \phi$ (A & B are disjoint).

$\therefore P(A \cup B) = P(A) + P(B)$
$$= \frac{6}{36} + \frac{2}{36} = \frac{8}{36} = \frac{2}{9}$$

(B) $A = \{ (1,1), (2,2), (3,3), (4,4), (5,5), (6,6) \}$
$B = \{ (1,1), (1,2), (1,3), (2,1), (2,2), (3,1) \}$
$AB = \{ (1,1), (2,2) \} \rightarrow$ A & B are joint events.

$P(A \cup B) = P(A) + P(B) - P(AB)$
$$= \frac{6}{36} + \frac{6}{36} - \frac{2}{36} = \frac{10}{36} = \frac{5}{18}$$

Now,
(C) what is the pr. that a sum of (2) or (3) turns up?
(D) what is the pr. that both dice turn up the same or that a sum greater than (8) turns up? (H.W.)

Example (5): What is the pr. that a number selected at random from the first (500) positive integers is (exactly) divided by (3) or (4)?

$A: \frac{500}{3} = 166$, $B: \frac{500}{4} = 125$

AB: the largest integer less than or equal to $\frac{500}{12} = 41$

$\therefore P(A \cup B) = P(A) + P(B) - P(AB)$
$$= \frac{166}{500} + \frac{125}{500} - \frac{41}{500} = .5$$

$P(M) = .25$, $P(C) = .15$, $P(MC) = .10$

(i) $P(M|C) = \dfrac{P(MC)}{P(C)} = \dfrac{.10}{.15} = \dfrac{2}{3}$

(ii) $P(C|M) = \dfrac{P(MC)}{P(M)} = \dfrac{.10}{.25} = \dfrac{2}{5}$

(iii) $P(M \cup C) = P(M) + P(C) - P(MC)$

الحوادث المستقلة "Independent Events"

يقال للحادثين B,A في الفضاء العيني لتجربة عشوائية معينة انها مستقلان اذا لم يؤثر احدهما على وقوع الاخر .

وهذا يعني ان B,A حادثين مستقلين اذا وفقط اذا تحققت العلاقة التالية

$$P(A) \times P(B) = P(AB)$$

ملاحظة : كل حادثين مستقلين في Ω فانهما يجب ان يكون متصلين والعكس غير صحيح

مثال :- اذا كان B,A حادثين مستقلين في Ω بحيث ان

$$P(A) = 0.4 \ , \ P(B) = 0.2$$

جد :- P(A∪B)

الحل :-

$$P(A \cup B) = P(A) + P(B) - P(AB)$$
$$= P(A) + P(B) - P(A) \cdot P(B)$$
$$= 0.4 + 0.2 - (0.4)(0.2)$$
$$= 0.6 - 0.08$$
$$= 0.52$$

22

نظرية ١

<u>نظرية (١)</u> اذا كان كل من   A و B حادثين مستقلين في تجربة عشوائية معينة فان :-

١) A , B^c حادثين مستقلين ايضا [indep. Events] يعني $P(AB^c) = P(A).P(B^c)$

٢) A^c , B حادثين مستقلين ايضا [indep. Events] ⟵ $P(A^cB) = P(B).P(A^c)$

٣) A^c , B^c حادثين مستقلين ايضا [indep. Events] ⟵ $P(A^cB^c) = P(B^c)P(A^c)$

مثال :- اذا كان احتمال نجاح احمد في امتحان معين هو (٠,٨) واحتمال نجاح سعيد في نفس الامتحان هو (٠,٧) جد :-

١) احتمال نجاح احمد وعدم نجاح سعيد

٢) احتمال نجاح احدهما على الأكثر

الحل :-

نفرض ان نجاح احمد هو A ⟵ $P(A) = 0.8$

نفرض ان نجاح سعيد هو B ⟵ $P(B) = 0.7$

نلاحظ استقلال الحادثين

(١)

$$P(AB^c) = P(A)P(B^c) = (0.8)[1 - 0.7] = 0.24$$

(٢)

$$P(AB^c) + P(A^cB) + P(A^cB^c)$$

$$= P(A)P(B^c) + P(A^c).P(B) + P(A^c)P(B^c)$$
$$= (0.8)(0.3) + (0.2)(0.7) + (0.2)(0.3)$$
$$= 0.44$$

نظرية (٢) اذا كان كل من A,B حادثين منفصلين (disjoint events) بحيث ان $A \neq \emptyset, B \neq \emptyset$ فان A,B حادثين معتمدين (غير مستقلين) (dependent)

<u>الحوادث المعتمدة</u>   " Dependent Events "

يقال ان A , B حادثين معتمدين (غير مستقلين) اذا وفقط اذا $P(AB) \neq P(A).P(B)$

23

مثال :– سحب عنصرين من مجموعة مكونة من اربعة عناصر {1,2,3,4} عنصر عنصر

بدون ارجاع (ومع الارجاع) فاذا كانت الحادثين B,A كما يلي :–

A : العنصر الاول فيها هو (٢).

B : العنصر الثاني بها هو (١) .

هل ان A,B حادثين مستقلين ؟

الحل :– ١) طريقة السحب الاولى (بدون ارجاع)

$$P_2^4 = \frac{4!}{2!} = 12$$

$$\Omega = \left\{ \begin{array}{cccc} (1,2) & (2,1) & (3,1) & (4,1) \\ (1,3) & (2,3) & (3,2) & (4,2) \\ (1,4) & (2,4) & (3,4) & (4,3) \end{array} \right\}$$

$$A = \{(2,1),(2,3),(2,4)] \subset S \Rightarrow P(A) \frac{3}{12} = \frac{1}{4}$$

$$B = \{(2,1),(3,1),(4,1)\} \subset S \Rightarrow P(B) = \frac{3}{12} = \frac{1}{4}$$

$$AB = \{(2,1)\} \subset S \Rightarrow P(AB) = \frac{1}{12}$$

$$P(A)xP(B) = \frac{1}{4} * \frac{1}{4} = \frac{1}{16}$$

نلاحظ الآن

$$P(AB) = \frac{1}{12}$$

$$\therefore P(A)xP(B) \neq P(AB)$$

∴ A و B غير مستقلين

٢)طريقة السحب الثانية (مع الارجاع)

عدد عناصر   هو (4²)=16

$$\Omega = \begin{Bmatrix} (1,1) & (2,1) & (1,11) & (4,11) \\ (1,2) & (2,2) & (3,2) & (4,2) \\ (1,3) & (2,3) & (3,3) & (3,3) \\ (1,4) & (2,4) & (3,4) & (4,4) \end{Bmatrix}$$

$A = \{(2,1),(2,2),(2,3),(2,4)\} \Rightarrow P(A) = \dfrac{4}{16} = \dfrac{1}{4}$

$B = \{(1,1),(2,1),(3,1),(4,1)\} \Rightarrow P(B) = \dfrac{4}{16} = \dfrac{1}{4}$

$AB = \{(2,1)\} \Rightarrow P(AB) = \dfrac{1}{16}$

$P(A) x P(B) = \dfrac{1}{4} x \dfrac{1}{4} = \dfrac{1}{16}$

$\therefore P(AB) = P(A) x P(B)$

Chapter Three

"Random variables and Probability Distribution"

Def.: A random variable X is a function that mapps all elements $s \in S$ (all event in ζ) to a real numbers (Rx) denoted by R. V.

Ex 1.: Toss a coin twice.

Let X = number of H show that X is a R. V.

S = {HH, HT, TH, TT}

$x(HH) = 2$, $x(HT) = 1$, $x(TH) = 1$, $x(TT) = 0$

Rx = {x; x = 0 , 1, 2} countable

Note: We shall use X to denoted of R. V.X and x to denote of value of R. V. X, $x \in X$: 0, 1, 2 (in ex. "1").

Ex2.: Choose a point from interval (0, 1).

Let X be the chosen point, to show X is a R. V.

S consist all point in (0, 1)

$\therefore$ S has infinite number of points

The points in S are mapped to a real numbers.

then X is a R. V.

Rx = {x; $0 < x < 1$} uncountable.

Def.: A random variable X is a say to be discret r. v. if Rx is countable. See ex. "1" above, denoted by d. r. v.

Def.: A random variable x is say to be continuous r. v. if Rx is uncountable denoted by c.r.v.

See ex, "2" above.

Ex.3: Toss a coin until first H appears.

Let x: number of tosses. show that x is d.r.v.

x ∈ X: 1, 2, 3, 4, ….

∴ Rx = {x; x ∈ N} countable

∴ x is d.r.v.

Def.: *Probability Mass function (P. M. f).*

Let X be a d.r.v.

A function f is a p.m.f. of X if $f(x) = p(X = x)$, and satisfy the following conditions: –

1. $f(x) \geq 0, \forall x \in X$, 2. $\sum_{\forall x \in X} f(x) = 1$

Note: 1. condition (1) shows the graph of f(x)   above of the x – axis.

2. Also, if A ⊂ S then $P(x \in A) = \sum_{x \in A} f(x) = 1$

Ex.: Given $f(x) = \begin{cases} \dfrac{x}{10}, & \text{for } x = 0, 1, 2, 3, 4 \\ 0, & \text{otherwise} \end{cases}$

Show that f(x) is a p.M.f.

ex. Two dices are thrown. Find the p.m.f. f(x) and sketch f(x).

let $Y = |d_1 - d_2|$

Sol. $S = \{(d_1, d_2); d_i \in \text{dice}\}$

n(S) = 36 = 6²

R_x = ?

$R_y = \{0, 1, 2, 3, 4, 5\}$ = discrete

$f(0) = P(X = 0) = \frac{6}{36} > 0$

$f(1) = P(X = 1) = \frac{10}{36} > 0$

$f(2) = P(X = 2) = \frac{8}{36}$

$f(3) = P(Y = 3) = \frac{6}{36} > 0$

$f(4) = P(X = 4) = \frac{4}{36}$

$f(5) = P(X = 5) = \frac{2}{36}$

$\sum f(x) = 1$

cond. "1": T. p. $f(x) \geq 0 \; \forall x \in X$

$$f(0)=0, \; f(1)=\frac{1}{10}, \; f(2)=\frac{2}{10}, \; f(3)=\frac{3}{10}, \; f(4)=\frac{4}{10}$$

$\therefore f(x) \geq 0 \; \forall x \in X$

$\therefore$ cond (1) satisfied.

cond "2": T.p $\sum\limits_{x=0}^{4} f(x) = 1$

$$\sum_{x=0}^{4} f(x) = 0 + \frac{1}{10} + \frac{2}{10} + \frac{3}{10} + \frac{4}{10} = \frac{10}{10} = 1 .$$

$\therefore f(x)$ is a p. M.f

* $p(x=1) = f(1) = \dfrac{1}{10}$

* $p(x=8) = f(8) = 0$

* $p(x \geq 3) = p[(x=3) \cup (x=4)] = p(x=3) + p(x=4)$

$$= f(3) + f(4) = \frac{3}{10} + \frac{4}{10} = \frac{7}{10}$$

or by note 2 $\; p(x \geq 3) = \sum\limits_{x=3}^{4} f(x) = f(3) + f(4) = \dfrac{7}{10}$

* $p(x \leq 2) = p[(x=2) \cup (x=1)] = p(x=2) + p(x=1)$

$$= f(2) + f(1) = \frac{2}{10} + \frac{1}{10} = \frac{3}{10}$$

Ex.: Given a p. m. f. $f(x) = \begin{cases} \dfrac{x}{k}, & \text{for } x = 1,2,3,4,5 \\ 0, & \text{otherwise} \end{cases}$

find the value of k and sketch f(x).

Sol.: $\because f(x)$ is a p. m .f.

$\therefore$ by cond "2" we get $\sum\limits_{x=1}^{5} f(x) = 1$

$f(1) + f(2) + f(3) + f(4) + f(5) = 1$

$$\frac{1}{k} + \frac{2}{k} + \frac{3}{k} + \frac{4}{k} + \frac{5}{k} = 1 \; \Rightarrow \; \therefore k = 15$$

$\therefore f(x) = \begin{cases} \dfrac{x}{15}, & \text{for } x = 1,2,3,4,5 \\ 0, & \text{otherwise} \end{cases}$

Ex.: Toss a coin 3-times. Let x = number of H. find the p. M.f. of x and sketch it's graph.

Sol.: S = {HHH, HHT, HTH, HTT, THH, THT, TTH, TTT}

Find the value of K.

Sol: Since $f(x)$ is p.m.f. then cond. ② $\sum\limits_{\forall x \in R_x} f(x) = 1$ is satisfied.

By cond. ② we get: $\sum\limits_{x=1}^{\infty} K\left(\frac{2}{3}\right)^x = 1$

$$1 = K \sum\limits_{x=1}^{\infty} \left(\frac{2}{3}\right)^x$$

$$1 = K\left[\left(\frac{2}{3}\right) + \left(\frac{2}{3}\right)^2 + \dots + \left(\frac{2}{3}\right)^n + \dots \right]$$

$$1 = \left(\frac{2}{3}\right)K\left[1 + \left(\frac{2}{3}\right) + \dots + \left(\frac{2}{3}\right)^{n-1} + \dots \right]$$

Geometric Series

since $r = \left(\frac{2}{3}\right) < 1 \implies$ the series is convergent.

$$1 = \left(\frac{2}{3}\right)K\left[\frac{1}{1-\left(\frac{2}{3}\right)} \right] = \left(\frac{2}{3}\right)K\left[\frac{1}{\frac{1}{3}} \right] = \left(\frac{2}{3}\right)K(3) = 2K$$

$\frac{1}{4} t^2 = 1 \Rightarrow t^2 = 4 \Rightarrow t = \sqrt{4} = \pm 2 \Rightarrow \boxed{t = 2}$ only

since $\{0 \leq x \leq 4\} = R_x$ is positive.

(b) $P(X \leq t) = \frac{1}{2}$

$P(X \leq t) = \frac{1}{8} \int_0^t x \, dx = \frac{1}{16} x^2 \Big|_0^t = \frac{1}{16} t^2 \Rightarrow \frac{1}{16} t^2 = \frac{1}{2} \Rightarrow t^2 =$

$\frac{1}{8}t^2 = 1 \Rightarrow t^2 = 8 \Rightarrow t = \pm 2\sqrt{2} \Rightarrow t = +2\sqrt{2}$ (only)

since $R_x = \{x : 0 \le x \le 4\}$ is positive.

Now; Find $P(X \le 2\sqrt{2})$?

$P(X \le 2\sqrt{2}) = \frac{1}{8}\int_0^{2\sqrt{2}} x\, dx = \frac{1}{16}x^2 \Big|_0^{2\sqrt{2}} = \frac{1}{16}(2\sqrt{2})^2 = \frac{1}{16}(8)$

15

Q9: Answer by (true) or (False) and given the reason

① If X is c.r.v., then $P(a \leq X \leq b) \neq P(a < X < b)$.
(False) since $P(a \leq X \leq b) = P(a < X < b)$ if X is c.r.v, because $P(X=a) = 0$ & $P(X=b) = 0$ when X is c.r.v.

② If X is d.r.v. with c.d.f. $F(x)$, then $f(x) = \frac{d}{dx} F(x)$.
(False), only when X is c.r.v., $f(x) = \frac{d}{dx} F(x)$.

③ If X is a r.v. with c.d.f. $F(x)$, then $P(a < X < b) = F(b) - F(a)$.
(False), since by Th. $P(a < X \leq b) = F(b) - F(a)$

④ If a c.d.f. $F(x)$ conts. at $x=a$, then $P(X=a) = 0$.
(True), since if $F(x)$ conts. at $x=a$, then $F(a^+) = F(a^-)$ and $P(X=a) = F(a^+) - F(a^-)$ (by Theorem).

⑤ $F(\infty) = 0$ & $F(-\infty) = 1$
(False), $F(\infty) = 1$ and $F(-\infty) = 0$ (By Theorem).

⑥ state (Cauchy dist.):
$f(x) = \begin{cases} \frac{1}{\pi(1+x^2)} & \text{for } -\infty < x < \infty \\ 0 & \text{o.w.} \end{cases}$ and p.m.f.

(False), Cauchy dist. is p.d.f. since $R_X = \{x; -\infty < x < \infty\}$ and $f(x) = \frac{1}{\pi(1+x^2)}$ for $-\infty < x < \infty$ (only).

H.W.: Given a c.d.f. $F(x) = \begin{cases} x-3 & \text{for } x \leq x \end{cases}$
① Find & sketch the p.d.f. $f(x)$.
② Is $F(x)$ conts. at $x=3$? why?

16

Q_{10}: Show that there does not exist any number (C) s.t. the following function $f(x)$ would be a p.d.f.

$$f(x) = \begin{cases} \dfrac{C}{1+x} & \text{for } x > 0 \\ 0 & \text{o.w.} \end{cases}$$

Sol.

If cond. ② is satisfied then $f(x)$ is p.d.f.

I.e. T.P. $\displaystyle\int_{-\infty}^{\infty} f(x)\,dx \overset{?}{=} 1$ (if we can that) كيف نجد قيمة (C) (ونحدد قيمة $f(x)$ في جميع الحالات)

$$\int_{0}^{\infty} \frac{C}{1+x}\,dx = C \, Ln(1+x)\Big|_{0}^{\infty} = C\big[Ln(\infty) - Ln(1)\big]$$
$$= C[\infty - 0] = \infty$$

∴ C is not exist.

Then does not exist any no. (C) s.t. $f(x)$ be a p.f.

H.W.: Given a p.d.f. $f(x)$:

$$f(x) = \begin{cases} Ce^{-2x} & \text{for } x > 0 \\ 0 & \text{o.w.} \end{cases}$$

① Find the value C and sketch it's graph.
② Find the c.d.f. of X ($F(x)$) and sketch it's graph.

Q_{11}: Show that the following function be a pr. f.
Sol. T.P. cond. ①

$$f(x) = \begin{cases} 2\sin x \cos x & \text{for } 0 < x < \dfrac{\pi}{2} \\ 0 & \text{o.w.} \end{cases}$$

note: $2\sin x \cos x = \sin 2x$

Sol. T.P. cond. ① $f(x) \geq 0$ $\forall x \in (0, \frac{\pi}{2})$

$$2\sin x \cos x \geq 0 \qquad \forall x \in (0, \tfrac{\pi}{2})$$

T.P. cond. ②

$$\int_{0}^{\frac{\pi}{2}} 2\sin x \cos x\,dx = \int_{0}^{\frac{\pi}{2}} \sin 2x\,dx = -\frac{1}{2}\cos 2x\Big|_{0}^{\frac{\pi}{2}} = -\frac{1}{2}\big[\cos \pi - \cos 0\big]$$
$$= -\frac{1}{2}[-1-1] = 1$$

∴ By cond. ① and ② we get: $f(x)$ is p.d.f.

17

Q_{12}: Show that if the following function be pr.f.:

$$f(x) = \begin{cases} \frac{2}{\pi} \sin^2(\frac{x}{2}) & \text{for } 0 < x < \pi \\ 0 & \text{o.w.} \end{cases}$$

Sol. T.P. Cond. ①

i.e. $f(x) \geq 0 \quad \forall x \in (0, \pi)$

$\sin^2 \frac{x}{2} \geq 0 \Rightarrow \frac{2}{\pi} \sin^2 \frac{x}{2} \geq 0 \quad \forall x \in (0, \pi)$

T.P. Cond. ②

Note: $\sin^2 x = 1 - \cos x$

$\frac{1}{\pi} \int_0^\pi 2 \sin^2 \frac{x}{2} \, dx = \frac{1}{\pi} \int_0^\pi (1 - \cos x) \, dx$

$= \frac{1}{\pi} (x - \sin x) \Big|_0^\pi = \frac{1}{\pi} [(\pi - 0) - (0 - 0)]$

$= \frac{\pi}{\pi} = 1$

∴ $f(x)$ is a p. d. f.

Q_{13}: A box has (4) red and (3) black balls. Choose a
sample of (3) balls one by one without replacement.
Let X be a number of black in a sample. Find the
p.m.f. of X and sketch it's graph. Also find the Pr. that
a sample has at least (2) red balls.

Sol.

$\boxed{\begin{array}{cc} 4 & r \\ 3 & b \end{array}} \xrightarrow[\text{without rep.}]{(1-1)} \boxed{\quad}$
$\quad\quad\quad\quad\quad\quad\quad\quad K = 3$

$X \equiv$ no. of black balls in a sample.

∴ $X = 0, 1, 2, 3 = $ d.r.v.

$f(x) = P(X = x)$ if P. m. f.

Event $(X = x)$: a sample have (x) black and (3-x) red balls.

18

Event $(X=x)$ has $\nearrow P_x^3 \, P_{3-x}^4$ and $n(s) = P_3^7$

no. of black balls

$$f(x) = P(X=x) = \begin{cases} \dfrac{P_x^3 \, P_{3-x}^4}{P_3^7} & \text{for } X=0,1,2,3 \\ \\ 0 & \text{o.w.} \end{cases}$$

H.W. Find $F(x)$ of this problem.

Q14: Consider the following c.d.f.

$$F(x) = \begin{cases} 0 & \text{for } X < -1 \\ \dfrac{1}{2}(X^3+1) & \text{for } -1 \le X < 1 \\ 1 & \text{for } X \ge 1 \end{cases}$$

Find ① $P(-1 < X < 1)$, $P(-1 < X \le 1)$

② p.d.f. $f(x)$

③ $P(-2 < X < 2)$

sol.

① $P(-1 \le X < 1) = P(-1 < X \le 1) = F(1) - F(-1)$ (by Th.)

   X is c.r.v.
   & F(x) is conts. ∴ dx =1

   $= 1 - \dfrac{1}{2}((-1)^3+1)$

   $= 1$

② $f(x) = F'(x) = \begin{cases} \dfrac{3}{2}X^2 & \text{for } -1 \le X \le 1 \\ 0 & \text{o.w.} \end{cases}$

   p.d.f. of x

   Note: F(x) is conts. at X = -1

③ $P(-2 < X < 2) = P(-2 < X \le 2) = F(2) - F(-2)$ (by Th.)

   $= 1 - 0$

   $= 1$

Note $F(-2) = F(-2^+) - F(-2)$

$= 0 - 0 = 0$ ⟹ F is conts. at X = -2

19

Q15: Given a p.d.f.

$$f(x) = \begin{cases} b\sin x \cos x & \text{for } 0 \le x < \frac{\pi}{2} \\ 0 & \text{o.w.} \end{cases}$$

Find the value of b.

Sol: ∵ $f(x)$ is a p.d.f. ⟹ cond.② is satisfied.

∴ $b\int_0^{\frac{\pi}{2}} \sin x \cos x \, dx = 1$

$1 = b\left[\int_0^{\frac{\pi}{2}} \frac{1}{2}\sin 2x \right] dx$ (since $\sin 2x = 2\sin x \cos x$)

$\frac{1}{2}\sin 2x = \sin x \cos x$

$1 = -\frac{b}{2} \cos 2x \Big|_0^{\frac{\pi}{2}}$

$1 = -\frac{b}{2}\left[\cos \pi - \cos 0 \right]$

$1 = -\frac{b}{2}\left[-1 - (1) \right] \implies b = 1$

∴ $f(x) = \begin{cases} \sin x \cos x & \text{for } 0 < x < \frac{\pi}{2} \\ 0 & \text{o.w.} \end{cases}$

Q16: Given a d.f.

$$F(x) = \begin{cases} 0 & \text{for } x < -2 \\ \frac{x+3}{5} & \text{for } -2 \le x < 2 \\ 1 & \text{for } x \ge 2 \end{cases}$$

(1) Find $P(X = -2)$, $P(-3 < X < -2)$
(2) Find $f(x)$
(3) Is $F(x)$ cont. at $X = 2$? why?

Sol.

(1) $P(X = -2) = F(-2^+) - F(-2^-)$ by Th. $P(X=x) = F(x^+) - F(x^-)$

$\qquad = \left(\frac{-2+3}{5}\right) - 0 = \frac{1}{5}$

$P(-3 < X < -2) + P(-2 < X < -2)$

$\qquad \left(F(x) \text{ is cont.} \atop \text{at } x = -2 \right)$

(2) $f(x) = \dfrac{dF(x)}{dx} = F'(x) = \begin{cases} \dfrac{1}{5} & \text{for} \quad -2 < x < 2 \\ 0 & \text{o.w.} \end{cases}$

$P(-3 < x < -2) = \displaystyle\int_{-3}^{-2} f(x)\,dx = 0$

(3) $F(x)$ is conts. at $x = 2$ since $F(2^-) = F(2^+)$

$F(2^+) = 1$, $F(2^-) = \dfrac{2+3}{5} = \dfrac{5}{5} = 1$

Q17: Given the following p.m.f.

$f(x) = \begin{cases} K \left(\dfrac{2}{3}\right)^{x-2} & \text{for} \quad x = 2, 3, 4, \dots \\ 0 & \text{o.w.} \end{cases}$

Find the value of K.

sol. $\because f(x)$ is p.m.f. then cond. ② is satisfied.

$\therefore K \displaystyle\sum_{x=2}^{\infty} \left(\dfrac{2}{3}\right)^{x-2} = 1$

Note $K \displaystyle\sum_{x=2}^{\infty} \left(\dfrac{2}{3}\right)^{x-2} = K \displaystyle\sum_{x=0}^{\infty} \left(\dfrac{2}{3}\right)^{x}$

$\therefore 1 = K \displaystyle\sum_{x=0}^{\infty} \left(\dfrac{2}{3}\right)^{x} = K \left[\left(\dfrac{2}{3}\right)^{0} + \left(\dfrac{2}{3}\right) + \dots + \left(\dfrac{2}{3}\right)^{n} + \dots\right]$

$\underline{1 = K \left[1 + \left(\dfrac{2}{3}\right) + \dots + \left(\dfrac{2}{3}\right)^{n} + \dots\right]}$

Geometric series

$\because |r| = \left|\dfrac{2}{3}\right| < 1 \iff$ the series is convergent

$1 = K \left[\dfrac{1}{1 - \left(\dfrac{2}{3}\right)}\right] = K \cdot \dfrac{1}{(1/3)} = 3K$

$\Rightarrow 3K = 1 \Rightarrow \boxed{K = \dfrac{1}{3}}$

$\therefore f(x) = \begin{cases} \dfrac{1}{3} \left(\dfrac{2}{3}\right)^{x} & \text{for} \quad x = 0, 1, 2, \dots \\ 0 & \text{o.w.} \end{cases}$

② IS F continuous at $x = 0$? Why?

Sol.

① $P(X \leq -2) = F(-2)$ by def. of F

$$= 0$$

$P(X > 4) = 1 - P(X \leq 4)$
$$= 1 - F(4)$$
$$= 1 - [(1+4)e^{-4}]$$

② Yes, since $F(0^+) = F(0^-) = \text{Zero}$.

$$F(x) = \begin{cases} 0 & \text{for } x < 0 \\ x & \text{for } 0 \leq x \leq 1 \\ 1 & \text{for } x \geq 1 \end{cases}$$

① Find the P.f. of X ($f(x)$).

② Is F conts. at $x=1$? Why?

③ Find $P(X=0)$.

sol.

① $f(x) = F'(x) = \begin{cases} 0 & \text{for } x<0 \\ 1 & \text{for } 0\le x \le 1 \\ 0 & \text{for } x\ge 1 \end{cases} = \begin{cases} 1 & \text{for } 0<x<1 \\ 0 & \text{for o.w.} \end{cases}$

② Yes, since $F(1^+) = F(1^-) = 1$.

③ $P(X=0) = F(0^+) - F(0^-)$
$$= 0 - 0 = \text{Zero}$$

Q2: Show that the following function is Pr.f. of x:

$$f(x) = \begin{cases} (\frac{1}{2})^x & \text{for } x=1,2,3,\ldots \\ 0 & \text{o.w.} \end{cases}$$

sol.

Cond. ① $(\frac{1}{2})^1 > 0$, $(\frac{1}{2})^2 > 0$, ...

∴ $f(x) \ge 0$ $\forall x = 1,2,3,\ldots$

Cond. ② $\sum_{x=1}^{\infty} (\frac{1}{2})^x = [(\frac{1}{2})^1 + (\frac{1}{2})^2 + (\frac{1}{2})^3 + \cdots]$

$$= (\frac{1}{2})[1 + (\frac{1}{2}) + (\frac{1}{2})^2 + \cdots]; r = |\frac{1}{2}| < 1$$

Geometric series

$$= \frac{1}{2}(\frac{1}{1-\frac{1}{2}}) = \frac{1}{2} \cdot 2 = 1$$

Q3: Toss a coin fourth times (4th times). Find the c.d.f. of a r.v. X, when X represents the numbers of tail (T) in a sample.

sol.

$$f(x) = \begin{cases} \dfrac{C_x^4}{16} & \text{for } x=0,1,2,3,4 \\ 0 & \text{o.w.} \end{cases} \qquad n(s) = 2^4 = 16$$

$$F(x) = \sum_{x_j \le x} f(x_j)$$

p. 11

$$F(x) = \begin{cases} 0 & \text{for} & x<0 \\ F(0) = 0 + f(0) & & 0 \le x < 1 \\ F(1) = 0 + f(0) + f(1) & & 1 \le x < 2 \\ F(2) = 0 + f(0) + f(1) + f(2) & & 2 \le x < 3 \\ F(3) = 0 + f(0) + f(1) + f(2) + f(3) & & 3 \le x < 4 \\ F(4) = 1 = 0 + f(0) + f(1) + f(2) + f(3) + f(4) & & x \ge 4 \end{cases}$$

Group (8)

Q_1: Show that the following function is pr. function:

$$f(x) = \begin{cases} \dfrac{x+2}{25} & \text{for} & x = 1,2,3,4,5 \\ 0 & & \text{o.w.} \end{cases}$$

sol:

Cond.② : $\dfrac{1}{25} \sum\limits_{x=1}^{5} (x+2) = \dfrac{1}{25}[3+4+5+6+7] = \dfrac{25}{25} = 1$

Cond.① $f(1) = \dfrac{3}{25} > 0$, $f(2) = \dfrac{4}{25} > 0$, $\cdots$, $f(5) = \dfrac{7}{25} > 0$

∴ $f(x) \ge 0$ $\forall x = 1,2,3,4,5$

∴ $f(x)$ is pr.f.

Q_2: Given a c.d.f. of X :

$$F(x) = \begin{cases} 1-(1+x)e^{-x} & \text{for} & x>0 \\ 0 & \text{for} & x \le 0 \end{cases}$$

Find : ① $P(X \le 2) = F(2)$ by def. of F

$\qquad = 1-(1+2)e^{-2}$

② $P(1<X<3) = P(1<X \le 3)$ since F is cont.

$\qquad = F(3) - F(1)$ at $x=3$

$\qquad = (1-(1+3)e^{-3}) - (1-(1+1)e^{-1})$

③ $P(X>4) = 1 - P(X \le 4) = 1 - F(4) = 1-(1-(4+4)e^{-4})$

④ $P(X=0) = F(0^+) - F(0^-) = 1-(1+0)e^0 - 0$

$\qquad = 0$

Q_3: Answer by (true) or (False) and given the reason :
  If a c.d.f. $F(x)$ Continuous at $x=2$, then $P(X=2) \neq 0$.

sol. No, since if F conts. at $x=2$, then $F(2^+) = F(2^-)$

and $\quad P(X=2) = F(2^+) - F(2^-)$
$$= zero$$

Q_4: Given a set of integers $\{2,4,6,8,10\}$. Find the P.m.f. $f(x)$
  of X and sketch its graph.

sol.

$$f(x) = \begin{cases} X \sim \text{unif. (5)} \\ \dfrac{1}{5} \quad \text{for} \quad x=2,4,6,8,10 \\ 0 \qquad\qquad\qquad \text{o.w.} \end{cases}$$

CHAPTER FOUR

Expectation and Variance:

Def: Let x be a. r. v either d.r.v. or c.r.v."E(x)" is called the "Expectation of x" or "expected Value of x" or "mean of x" And denoted by μ.

Defined as followes:

1- $E(x) = \sum\limits_{\forall x} x\, f(x)$, when x is a d.r.v.

2- $E(x) = \int_{-\infty}^{\infty} xf(x)\, dx$ when x is a c.r.v.

Note: 1- the value of E (x) is constant.

2- E (x) exists if $\sum\limits_{\forall x} |x|\, f(x) < \infty$, when x is d.r.v.

3- E (x) exists if $\int_{-\infty}^{\infty} |x| f(x) dx < \infty$, when x is c.r.v.

Ex "1": Given p.m.f $f(x) = \begin{cases} \dfrac{\binom{3}{x}}{8} & for\ x = 0,2,3,1 \\ 0 & o.w \end{cases}$

Find E (X)?

Sol: $E(x) = \sum\limits_{x=0}^{3} x f(x)$

X	$f(x)=\dfrac{\binom{3}{x}}{8}$	x.f(x)
0	$\binom{3}{0} / 8 = \dfrac{1}{8}$	0

$\therefore p(y = 0) = 1 \Rightarrow p\{[x - E(x)]^2 = 0\} = 1$

$\therefore p\{(x - E(x)) = 0\} = 1 \Rightarrow \therefore p[x = E(x)] = 1$

$\therefore x = k \Rightarrow E(x) = E(k) = k \Rightarrow \therefore p[x = k] = 1$

* Existence of Mean and Variance:

$E(x)$ exists iff $E(|x|) < \infty$

$\because V(x) = E(x^2) - [E(x)]^2 \Rightarrow \therefore V(x)$ $\qquad$ exists iff $E(x)$ & $E(x^2)$ exist

Ex. "1": Given acauchy p.d.f $f(x) = \dfrac{1}{\pi(1 + x^2)}$ $\qquad$ for $-\infty < x < \infty$

Show that $E(x)$ dose not exist?

Sol.: $E(|x|) = \int\limits_{-\infty}^{\infty} x \dfrac{1}{\pi(1 + x^2)} dx = 2 \int\limits_{0}^{\infty} x \dfrac{1}{\pi(1 + x^2)} dx$

$\qquad = \dfrac{1}{\pi} \int\limits_{0}^{\infty} \dfrac{2x}{1 + x^2} dx = \dfrac{1}{\pi} \ln(1 + x^2) \big|_0^\infty = \dfrac{1}{\pi}[\ln \infty - \ln 1] \nless \infty$

$E(|x|) \nless \infty \Rightarrow E(x)$ $dose$ not $exist$

Exercises: 1. Let x be a c.r.v. have a p.d.f $f(x)$ where

Moments of Random Variables:

Def.: Let x be a r.v. either d.r.v. or c.r.v.. let $K \in I^+$ then $E(x^k)$ is called "the kth moment of x" or "the moment of order k of x".

when $k = 1 \Rightarrow E(x^1) = 1^{st}$ moment of $x = \mu$

$E(x^2) = 2^{nd}$ moment of x

Note: $E(x^k)$ exists iff $E(|x|^k) < \infty$

Theorem "8": If $E(x^k)$ exists then $E(x^j)$ exists, $j < k$ and $j, k \in I^+$

Proof: case "1" If x is c.r.v. with p.d.f $f(x)$

$\because E(x^k)$ exists $\Rightarrow \therefore E(|x|^k) < \infty$

T.p $E(x^j)$ exists, T.p $E(|x|^j) < \infty$

$E(|x|^j) = \int\limits_{-\infty}^{\infty} |x|^j f(x) dx$

$E(|x|^j) = \int\limits_{|x| \leq 1}^{-\infty} |x|^j f(x) dx + \int\limits_{x > 1} |x|^j f(x) dx$

2nd central moment of R.V.X is equal to V(x).

Ex.: Let x be a r.v.s.t $E(x) = 1$, $E(x^2) = 2$ and $E(x^3) = 5$. Find the 3rd central moment of x.

Sol.: $E[(x-\mu)^3] = E\{x^3 - 3\mu x^2 + 3\mu^2 x - \mu^3\}$

$$= E(x^3) - 3\mu E(x^2) + 3\mu^2 E(x) - \mu^3$$

$$= 5 - 3 \cdot 1 \cdot 2 + 3 \cdot 1 \cdot 1 - 1 = 1$$

Exercises: 1. If x ~ uniform (a, b); a, b ∈ R. Find the valued of 1st central moment of x and also find the 2nd central moment of x.

2. Let $\mu = E(x)$ and $\delta^2 = V(x)$ show that $E[(x-\mu)^4] \geq \delta^4$

i.e. 4th central moment of x is greater than or equal the square of variance of x.

Moment Generating Function (M.g.f).

Def.: A moment generating function (M.g.f) of a r.v.x is a function that determines all moments of x, denoted by $M_x(t)$. suppose that t ∈ (-h, h), h > 0.

If $E[e^{tx}]$ exists ∀t∈(-h, h) then $M_x(t) = E[e^{tx}]$, -h < t < h

There are two cases of $M_x(t)$.

Case "1": If x is a d.r.v. from a p.M.f f(x)

$$M_x(t) = E[e^{tx}] = \sum_{\forall x} e^{tx} f(x)$$

Case "2": If x is a c.r.v. have a p.d.f f(x)

$$M_x(t) = E[e^{tx}] = \int_{-\infty}^{\infty} e^{tx} f(x) dx$$

Ex.: Given a p.d.f $f(x) = \begin{cases} e^{-x} & \text{for } x > 0 \\ 0 & \text{o.w} \end{cases}$

Find $M_x(t)$ and sketch it's graph.

Sol.: $M_x(t) = E(e^{tx}) = \int_{0}^{\infty} e^{tx} \cdot e^{-x} dx = \int e^{-(1-t)x} dx$

This integration exist only when (1-t) > 0, i.e. t < 1

$$M_x(t) = \frac{-1}{1-t} e^{-(1-t)x} \Big|_0^\infty = \frac{-1}{1-t}\left[e_{=0}^{=\infty} - e_{=1}^{0}\right] = \frac{1}{1-t}$$

$$M_x(t) = \frac{1}{1-t} \quad \text{for} \quad t < 1$$

t	$M_x(t)$
1	∞
0	1
-1	0.5
-2	0.33
-3	0.25
$-\infty$	0

Graph of $M_x(t)$

Ex.: Given a p.M.f. $f(x) = \begin{cases} \dfrac{x}{15} & \text{for } x = 1, 2, 3, 4, 5 \\ 0 & \text{o.w} \end{cases}$

Find $M_x(t)$.

Sol.: $M_x(t) = E(e^{tx}) = \sum_{x=1}^{5} e^{tx} f(x) = \sum_{x=1}^{5} \frac{x}{15} e^{tx}$

$= \frac{1}{15} \sum_{x=1}^{5} x e^{tx} = \frac{1}{15}[1 \cdot e^t - 2 \cdot e^{2t} + 3 \cdot e^{3t} + 4 \cdot e^{4t} + 5e^{5t}] \quad \text{for} \ -\infty < t < \infty$

Theorem "9": Let x be a r.v. have a M.g.f. $M_x(t)$, then

$$M_x(0) = 1, \ M'_x(0) = E(x), \ M''_x(0) = E(x^2), \ M'''_x(0) = E(x^3), ...,$$
$$M_x^{(k)}(0) = E(x^k)$$

Proof: * $M_x(t) = E(e^{tx})$ by Macclaurin series

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + ... + \frac{x^k}{k!} + ...$$

$$\therefore e^{tx} = 1 + tx + \frac{t^2 x^2}{2!} + \frac{t^3 x^3}{3!} + ... + \frac{t^k x^k}{k!} + ...$$

$$M_x(t) = E[1 + tx + \frac{t^2 x^2}{2!} + \frac{t^3 x^3}{3!} + ... + \frac{t^k x^k}{k!} + ...]$$

$$M_x(t) = 1 + tE(x) + \frac{t^2}{2!}E(x^2) + \frac{t^3}{3!}E(x^3) + ... + \frac{t^k}{k!}E(x^k) + ...$$

$$M_x(t=0) = M_x(0) = 1$$

$$* M_x'(t) = \frac{dM_x(t)}{dt} = E(x) + \frac{2t}{2!}E(x^2) + \frac{3t^2}{3!}E(x^3) + ... + \frac{kt^{k-1}}{k!}E(x^k) + ...$$

$$M_x'(0) = E(x)$$

$$* M_x''(t) = E(x^2) + \frac{6t}{3!}E(x^3) + ... + \frac{k(k-1)t^{k-2}}{k!}E(x^k) + ...$$

$$M_x''(0) = E(x^2)$$

Simillary we can find $E(x^3), E(x^4), ... E(x^k)$, ~ ~ ~

Note: $M_x(t) = M_x(0) + tM_x'(0) + \frac{t^2}{2!}M_x''(0) + ... + \frac{t^k}{k!}M_x^{(k)}(0)$

This series is called the M. g.f. by Macclaurin series.

Ex.: Given $M_x(t) = \frac{1}{1-2t}$, $t < \frac{1}{2}$ Find $E(x)$ and $V(x)$

Sol.: $M_x(t) = (1-2t)^{-1}$, $t < \frac{1}{2}$

$$M_x'(t) = -(1-2t)^{-2} \cdot (-2) = 2(1-2t)^{-2}$$

$$\therefore E(x) = M_x'(0) = 2(1-0)^{-2} = 2$$

$$V(x) = E(x^2) - [E(x)]^2$$

$$M_x''(t) = 8(1-2t)^{-3}$$

$$\therefore E(x^2) = M_x''(0) = 8(1-0)^{-3} = 8$$

$$\therefore V(x) = 8 - 2^2 = 4 \geq 0$$

Theorem "10": Let x be a r.v. have a M.g.f $M_x(t)$. If $Y = ax + b$. $a, b, \in R$

then $M_y(t) = e^{bt} \cdot M_x(at)$

Proof: $Y = ax + b$

$$M_y(t) = E(e^{ty}) \ (by \ def.) = E[e^{t(ax+b)}] = E[e^{(at)x+bt}]$$

$$M_y(t) = [e^{(at)x} \cdot e^{bt}] = e^{bt}E[e^{(at)x}] = e^{bt} \cdot M_x(at)$$

$$Since \ M_x(t) = E(e^{tx}) \Rightarrow M_x(at) = E[e^{(at)x}]$$

Ex: Given $M_x(t) = \frac{1}{1-3t}$ for $t < \frac{1}{3}$, If $y = 1-2x$, find $M_y(t)$.

Sol: $y = (-2)x + 1$, $a = -2$, $b = 1$

By th. $(10) \Rightarrow M_y(t) = e^{bt} M_x(at) = e^t M_x(-2t)$

$\because M_x(t) = \dfrac{1}{1-3t}$ for $t < \dfrac{1}{3}$

$M_x(-2t) = \dfrac{1}{1-3(-2t)} = \dfrac{1}{1+6t}$ for $t > \dfrac{-1}{6}$

$M_y(t) = e^t \cdot \dfrac{1}{1+6t}$ for $t > \dfrac{-1}{6}$

The bonded of probability:

Theorem "11": ((Markov inquality))

If x is a r.v. and if $P(x \geq 0) = 1$ then $P(x \geq t) \leq \dfrac{E(x)}{t}$. for $t > 0$

Proof: case "1": if x is a c.r.v with a p.d.f $f(x)$

$\because p(x \geq 0) = 1 \Rightarrow \int_0^\infty f(x)dx = 1$

$f(x) > 0 \quad$ for $x \geq 0$
$\quad\quad = 0 \quad$ O.W

$E(x) = \int_0^\infty x f(x)dx = \int_0^t x f(x)dx + \int_t^\infty x f(x)dx \geq \int_t^\infty x f(x)dx \geq \int_t^\infty t f(x)dx \quad [x \geq t]$

$\therefore E(x) \geq \int_t^\infty t f(x)dx \Rightarrow E(x) \geq t \int_t^\infty f(x)dx$

$E(x) \geq t \cdot p(x \geq t)$

$\therefore p(x \geq t) \leq \dfrac{E(x)}{t}$

Case "2": If x is a d.r.v. with a p.m.f. $f(x)$ by the same method.

Theorem "12": "Chebyshev inqualities"

Let x be a r.v. where $V(x)$ exists, then:

1. $p(|x - \mu| \geq t) \leq \dfrac{V(x)}{t^2}$, $t > 0$, 2. $p(|x - \mu| < t) \geq 1 - \dfrac{V(x)}{t^2}$, $t > 0$,

Note: 1. $\dfrac{V(x)}{t^2}$ is called the upper buond of $p(|x - \mu| \geq t)$

2. $1 - \dfrac{V(x)}{t^2}$ is called the lower buond of $p(|x - \mu| < t)$

Proof: 1. $V(x) = E[(x - \mu)^2] \geq 0$

$Let\ y = (x - \mu)^2 \geq 0 \implies E(y) = E[(x - \mu)^2] = V(x) \geq 0$

$\therefore$ by Markov inquality, we get

$p(y \geq t^2) \leq \dfrac{E(y)}{t^2} \implies p[(x - \mu)^2 \geq t^2] \leq \dfrac{v(x)}{t^2}$

$p[|x - \mu| \geq t] \leq \dfrac{V(x)}{t^2}$

2. $p(A^c) = 1 - p(A)$

$p[|x - \mu| \geq t] = 1 - p[|x - \mu| < t] \leq \dfrac{V(x)}{t^2}$

$p[|x - \mu| < t] \geq 1 - \dfrac{v(x)}{t^2}$

Ex. "1": If $x \sim$ unif. $(-\sqrt{3}, \sqrt{3})$ then:

a. Find the upper bound of $p(|x - \mu| \geq \frac{3}{2})$

b. Find the value of $p(|x - \mu_x| \geq \frac{3}{2})$

Sol.:

a. $f(x) = \begin{cases} \dfrac{1}{\sqrt{3} + (\sqrt{3})} = \dfrac{1}{2\sqrt{3}} & \text{for } -\sqrt{3} < x < \sqrt{3} \\ 0 & \text{o.w.} \end{cases}$

$u.b = \dfrac{V(x)}{t^2}, \qquad t = \dfrac{3}{2}$

$E(x) = \int\limits_{\sqrt{3}}^{\sqrt{3}} X \dfrac{1}{2\sqrt{3}} dx = \dfrac{1}{4\sqrt{3}} X^2 \Big|_{\sqrt{3}}^{\sqrt{3}} = 0$

$E(x^2) = \int\limits_{-\sqrt{3}}^{\sqrt{3}} x^2 \dfrac{1}{2\sqrt{3}} dx = \dfrac{1}{6\sqrt{3}} x^3 \Big|_{\sqrt{3}}^{\sqrt{3}} = \dfrac{1}{6\sqrt{3}} [(\sqrt{3})^3 - (-\sqrt{3})^3] = \dfrac{1}{6\sqrt{3}} [3\sqrt{3} + 3\sqrt{3}] = 1$

$$\therefore V(x) = E(x^2) - [E(x)]^2 = 1 - 0 = 1$$

$$\therefore u.b = \frac{V(x)}{t^2} = \frac{1}{\left(\frac{3}{2}\right)^2} = \frac{4}{9} = 0.44$$

b. $p(|x - \mu| \geq \frac{3}{2}) = p(|x - 0| \geq \frac{3}{2}) = p(|x| \geq \frac{3}{2})$

$$= 1 - p(|x| < \frac{3}{2}) = 1 - p(-\frac{3}{2} < x < \frac{3}{2}) = 1 - \int_{-\frac{3}{2}}^{\frac{3}{2}} \frac{1}{2\sqrt{3}} dx$$

$$= 1 - \frac{1}{2\sqrt{3}} x \Big|_{-\frac{3}{2}}^{\frac{3}{2}} = 1 - \frac{1}{2\sqrt{3}}\left(\frac{3}{2} + \frac{3}{2}\right) = 1 - \frac{3}{2\sqrt{3}} = 1 - \frac{\sqrt{3}}{2}$$

$$= 1 - 0.866 = 0.134$$

Ex. "2": Given a p.d.f $f(x) = \begin{cases} \dfrac{2x}{9} & \text{for } 0 < x < 3 \\ 0 & \text{o.w.} \end{cases}$

a.   Find the lower bound of $p(\frac{5}{4} < x < \frac{11}{4})$

b.   Find the value of $p(\frac{5}{4} < x < \frac{11}{4})$

Sol.: a. L.b $= 1 - \dfrac{V(x)}{t^2}$

$E(x) = \int x \cdot \frac{2x}{9} dx = \frac{2}{27} x^3 \Big|_0^3 = \frac{2}{27}(27 - 0) = 2$

$E(x^2) = \int x^2 \cdot (\frac{2x}{9}) dx = \frac{2}{36} x^4 \Big|_0^3 = \frac{1}{18}(81) = \frac{9}{2} = 4.5$

$\therefore V(x) = E(x^2) - [E(x)]^2$

$$= 4.5 - 4 = 0.5 = \frac{1}{2}$$

$p(\frac{5}{4} < x < \frac{11}{4}) = p(\frac{5}{4} - 2 < x - 2 < \frac{11}{4} - 2) = p(-\frac{3}{4} < x - 2 < \frac{3}{4})$

$$= p(|x - 2| < \frac{3}{4})$$

$\therefore t = \frac{3}{4}$

$$\therefore L.b = 1 - \frac{V(x)}{t^2} = 1 - \frac{\frac{1}{2}}{\frac{9}{16}} = 1 - \frac{1}{2} \times \frac{16}{9} = 1 - \frac{8}{9} = \frac{1}{9}$$

b. $p(\frac{5}{4} < x < \frac{11}{4}) = \int\limits_{\frac{5}{4}}^{\frac{11}{4}} \frac{2x}{9} dx$

$= \frac{1}{9} x^2 \Big|_{\frac{5}{4}}^{\frac{11}{4}} = \frac{1}{9}[\frac{121}{16} - \frac{25}{16}] = \frac{1}{9}[\frac{96}{16}] = \frac{6}{9}$

Median of Distribution of r.v.:

<u>Def.</u>: The median (m) is a value of x such that satisfing the two following inqualities:

$$p(x < m) < \frac{1}{2} \quad \& \quad p(x \le m) \ge \frac{1}{2}$$

By properties of c.d.f $F(x)$

$p(x < m) = F(\overline{m}), \qquad p(x \le m) = F(m) = F(m^+)$

i.e.: $p(x < m) = F(\overline{m}) < \frac{1}{2}, \quad p(x \le m) = F(m^+) \ge \frac{1}{2}$

<u>Note</u> ① If $\overline{m} = m = m^+$ then

$p(x \le m) = F(m) = \frac{1}{2}$

② The value of median unique

<u>Ex.</u>: Given a p.m.f $\quad f(x) = \begin{cases} \dfrac{x}{15} & \text{for } x = 1, 2, 3, 4, 5 \\ 0 & \text{o.w.} \end{cases}$

Find the median of x.

<u>Sol.</u>: $\quad p(x < m) < \frac{1}{2} \quad \& \quad p(x \le m) \ge \frac{1}{2}$

Suppose that m = 1

$p(x < 1) = 0 < \frac{1}{2}, \quad p(x \le 1) = f(1) = \frac{1}{15} \not\ge \frac{1}{2}$

$\therefore m \ne 1$

Suppose that m = 2

$$p(x < 2) = f(1) = \frac{1}{15} < \frac{1}{2}$$

$$p(x \leq 2) = f(1) + f(2) = \frac{1}{15} + \frac{2}{15} = \frac{1}{15} \neq \frac{1}{2}$$

$$\therefore m \neq 2$$

Suppose that m = 3

$$p(x < 3) = f(1) + f(2) = \frac{1}{15} + \frac{2}{15} = \frac{1}{5} < \frac{1}{2}$$

$$p(x \leq 3) = f(1) + f(2) + f(3) = \frac{1}{15} + \frac{2}{15} - \frac{3}{15} = \frac{6}{15} \neq \frac{1}{2}$$

$$\therefore m \neq 3$$

Suppose that m = 4

$$\frac{12}{30} < \frac{15}{30}$$

$$p(x < 4) = f(1) + f(2) + f(3) = \frac{6}{15} < \frac{1}{2}$$

$$p(x \leq 4) = f(1) + f(2) + f(3) + f(4) = \frac{10}{15} \geq \frac{1}{2}$$

$$\therefore m = 4 \quad is\ median$$

Ex.: Given a p.d.f $f(x) = \begin{cases} \dfrac{1}{x^2} & for\ x > 1 \\ 0 & o.w. \end{cases}$

Find the median of x?

Sol.: $p(x < m) < \frac{1}{2}$ & $p(x \leq m) \geq \frac{1}{2}$

$$p(x < m) = \int_1^m \frac{1}{x^2}\, dx = -\frac{1}{x}\Big|_1^m = -[\frac{1}{m} - 1] < \frac{1}{2}$$

$$-\frac{1}{m} + 1 < \frac{1}{2} \Rightarrow -\frac{1}{m} < -\frac{1}{2} \Rightarrow m < 2 \quad .....(1)$$

$$p(x \leq m) = \int_1^m \frac{1}{x^2}\, dx \geq \frac{1}{2}$$

$$-[\frac{1}{m} - 1] \geq \frac{1}{2} \Rightarrow m \geq 2 \quad ....(2)$$

From (1) & (2) $\Rightarrow$ median = 2

Note: We can also find the value of (Median) from the graph of F(x) such that. At the point $F(x) = \frac{1}{2}$, draw a line to cut the curve of F(x) at A, draw a line to cut the X-axis at m (median) from ex. "2" above

$$f(x) = \begin{cases} \dfrac{1}{x^2} & \text{for } x > 1 \\ 0 & \text{o.w.} \end{cases}$$

$$F(x) = p(X \le x) = \int_1^x \frac{1}{t^2} dt = 1 - \frac{1}{X} \Rightarrow F(x) = \begin{cases} 1 - \dfrac{1}{x} & \text{for } x \ge 1 \\ 0 & \text{o.w.} \end{cases}$$

or : $F(x) = \frac{1}{2}$

$$1 - \frac{1}{x} = \frac{1}{2} \Rightarrow -\frac{1}{x} = -\frac{1}{2} \Rightarrow x = 2$$

Graph of F(x)

To Find the Mode of Dist. Of R.V.X

Def.: Mode is a value of a r.v.x that maximize f(x) i.e. If x_1 = mode. ⟶ then $f(x_1)$ is a Max.

Note: $F(x_1)$ is Max. $\Leftrightarrow$ $f''(x_1) < 0$

Ex.: Given a p.d.f. $f(x) = \begin{cases} 12x^2(1-x) & 0 < x < 1 \\ 0 & \text{o.w.} \end{cases}$

Find the mode of x?

Sol.: 0 < mode < 1

$f(x) = 12x^2 - 12x^3 \Rightarrow \quad f'(x) = 24x - 36x^2$

$\Rightarrow \quad 12x(2-3x) = 0 \qquad$ either $x = 0 \qquad$ or $\quad x = \frac{2}{3}$

$f''(x) = 24 - 72x \Rightarrow f''(0) = 24 > 0 \qquad \Rightarrow f(0)$ is min.

$$f''\left(\frac{2}{3}\right) = 24 - 72\left(\frac{2}{3}\right) = -24 < 0 \Rightarrow f\left(\frac{2}{3}\right) \quad is \text{ max}$$

$$X_1 = \frac{2}{3} = mode$$

Def.: Percentile

It is a value of x say (x_0) such that $p(x \le x_0) = \dfrac{t}{100}$ $0 < t < \infty$

denoted by P_t, $0 < t < 100$

i.e.: $P_t = x_0$

Ex.: Given a p.d.f $f(x) = \begin{cases} \dfrac{x}{2} & , 0 < x < 2 \\ 0 & , \quad\quad o.w. \end{cases}$

Find P_{40}, P_{65}

Sol.: let $p_{40} = x_0$, $t = 40$

$p(x \le x_0) = \dfrac{t}{100}$, $p(x \le x_0) = \dfrac{40}{100} = 0.4$

$\int_0^{x_0} \dfrac{x}{2} dx = \dfrac{x^2}{4} \Big|_0^{x_0} = 0.4$

$[x_0^2 - 0^2] = 4(0.4) \Rightarrow x_0^2 = 1.6 \Rightarrow x_0 = \sqrt{1.6} = 1.26$

If $P(X \geqslant 1) > 0.8$, Find n ?

$$P(X \geqslant 1) > 0.8$$
$$1 - P(X < 1) > 0.8$$
$$1 - f(x=0) > 0.8$$
$$-f(0) > -1 + 0.8 = -0.2$$
$$f(0) < 0.2$$

$$\binom{n}{0}(\tfrac{1}{3})^0 (\tfrac{2}{3})^n < 0.2$$
$$(\tfrac{2}{3})^n < 0.2$$

if $n=1$, $\tfrac{2}{3} = .67 \not< .2$

if $n=2$, $(\tfrac{2}{3})^2 = \tfrac{4}{9} = .44 \not< .2$

if $n=3$, $(\tfrac{2}{3})^3 = \tfrac{8}{27} = .29 \not< .2$

if $n=4$, $(\tfrac{2}{3})^4 = \tfrac{16}{18} \approx .19 < .2$

$n = 4$ is sufficient

if $n=5$, $(\tfrac{2}{3})^5 = \tfrac{32}{243} \approx .12 < .2$

then $n \geqslant 4$ s.t. $(\tfrac{2}{3})^n < .2$

$\therefore$ we must toss a die at least (4) time.

④ Let $X \sim b(2, P)$ & $Y \sim b(4, P)$. If $P(X \geq 1) = \frac{5}{9}$, Find $P(Y \geq 1)$.

sol. ∵ $X \sim b(2, P)$

∴ $f(x, 2, P) = \begin{cases} \binom{2}{x} P^x (1-P)^{2-x} & \text{for } x = 0, 1, 2 \\ 0 & \text{o.w.} \end{cases}$

$P(X \geq 1) = \frac{5}{9} \implies 1 - P(X < 1) = \frac{5}{9} \implies 1 - P(X = 0) = \frac{5}{9}$

∴ $P(X = 0) = \frac{4}{9} = f(0)$

$\binom{2}{0} P^0 (1-P)^2 = \frac{4}{9}$

$1 \cdot 1 \cdot (1-P)^2 = \frac{4}{9}$

$(1-P)^2 = \frac{4}{9}$

$(1-P) = \mp \frac{2}{3}$

If $1-P = \frac{2}{3}$

then $\boxed{P = \frac{1}{3}}$

If $1-P = -\frac{2}{3}$

since $P = 1 + \frac{2}{3} = \frac{5}{3} > 1$

$0 < P < 1$

∴ $\boxed{P = \frac{1}{3}}$

∴ $Y \sim b(4, P)$

∴ $f(y, 4, P) = \begin{cases} \binom{4}{y} P^y (1-P)^{4-y} & ; y = 0, \cdots, 4 \\ 0 & \text{o.w.} \end{cases}$

∵ $P = \frac{1}{3} \implies 1 - P = \frac{2}{3}$

$P(Y \geq 1) = 1 - P(Y < 1) = 1 - P(Y = 0)$

$= 1 - f(0)$

$= 1 - \binom{4}{0} \left(\frac{1}{3}\right)^0 \left(\frac{2}{3}\right)^4$

∴ $P(Y \geq 1) = 1 - \left(\frac{2}{3}\right)^4 = 1 - \frac{16}{27} = \frac{11}{27} < 1$

Properties of Joint P.d.f.

① A joint p.d.f. $f(x,y)$ satisfies two conditions:
   ⓐ $f(x,y) \geq 0 \qquad \forall (x,y) \in R$
   ⓑ $\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f(x,y)\, dx\, dy = 1$

② Also :

أذا Region المنطقة
① $R = \{(x,y) ; 0 \leq x \leq 1, 0 \leq y \leq 1\}$
② $R = \{(x,y) ; 0 \leq x < y \leq 1\}$
③ $R = \{(x,y) ; x^2 + y^2 \leq 1\}$

⓵

∵ $f(x,y)$ is a function of x and y, from $f(x,y)$, we can find a function of x alone $f_1(x)$ and a function of y alone $f_2(y)$. s.t.

$f_1(x)$ is called Marginal p.d.f. of x

where $f_1(x) = \int_{\square}^{\square} f(x,y)\,dy$; limits of integral follows limits of y

$f_2(y)$ is called Marginal p.d.f. of y

where $f_2(y) = \int_{\square}^{\square} f(x,y)\,dx$; limits of integral follows limits of x

Example: Given a joint p.d.f. (J.p.d.f.) $f(x,y)$:

$$f(x,y) = \begin{cases} Kx^2y & \text{for } 0 < x < 2 \ , \ 0 < y < 1 \\ 0 & \text{o.w.} \end{cases}$$

ⓐ Find the value of K,

ⓑ Find $P(0 < x < \tfrac{1}{3}, \tfrac{1}{2} < y < 2)$, ⓕ $P(X > \tfrac{1}{2})$, $P(y < \tfrac{1}{3})$

ⓒ Find $P(x+y \geq 1)$, ⓓ Find $f_1(x)$ and $f_2(y)$

Example ⑦ A point (x,y) is chosen from a region R which is bounded by a curve $y=x^2$ and a line $y=x$, find $f(x,y)$.

Sol. Sketch $y=x$ and $y=x^2$

A point $(x,y) \in R$ must be above the curve $y=x^2$ and under the line $y=x$, then $x^2 \leq y \leq x$. $\left(x^2 = x \quad \text{نقاط التقاطع هي} \quad (0,0), (1,1) \right.$
$\left. \rightarrow x=0, y=0 \text{ و } x=1, y=1 \right)$

Also that point must be between $0 \leq x \leq 1$, $0 \leq y \leq 1$

$$0 \leq x^2 \leq y \leq x \leq 1$$

$$R = \{ (x,y); \ 0 \leq x^2 \leq y \leq x \leq 1 \}$$

$$Area(R) = \int_0^1 \int_{x^2}^{x} dy\, dx = \int_0^1 |x - x^2| dx$$

$$= \int_0^1 (x - x^2) dx$$

$$= \left(\frac{x^2}{2} - \frac{x^3}{3} \right) \Big|_0^1 = \frac{1}{2} - \frac{1}{3} = \frac{1}{6}$$

$$f(x,y) = \frac{1}{1/6} = \begin{cases} 6 \\ 0 \end{cases} \quad \begin{matrix} \text{for } 0 \leq x^2 \leq y \leq x \leq 1 \\ \text{o.w.} \end{matrix}$$

$$\int_0^1 |x^2 - x| dx = \int_0^1 (x - x^2) dx$$

Example ⑧ A point (x,y) is chosen from a region R where

$$R = \{ (x,y); \ x^2 + y^2 \leq 1 \}$$

a. find $f(x,y)$
b. find $f_1(x)$ & $f_2(y)$

Sol.
a. Let $x^2 + y^2 = 1 \rightarrow r = 1$ نصف القطر

b. We must find $f_1(x)$ & $f_2(y)$:

$f_1(x) = \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \frac{1}{\pi} dy$ for $-1 \le x \le 1$

$= \frac{1}{\pi} y \Big|_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} = \frac{1}{\pi} \left[\sqrt{1-x^2} + \sqrt{1-x^2} \right] = \begin{cases} \frac{2}{\pi} \sqrt{1-x^2} & \text{for } -\sqrt{1-y^2} \le x \le \sqrt{1-y^2} \\ 0 & \text{o.w.} \end{cases}$

$f_2(y) = \int_{-\sqrt{1-y^2}}^{+\sqrt{1-y^2}} \frac{1}{\pi} dx$ for $-1 \le y \le 1$

$= \frac{1}{\pi} x \Big|_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} = \begin{cases} \frac{2}{\pi} \sqrt{1-y^2} & \text{for } -\sqrt{1-x^2} \le y \le \sqrt{1-x^2} \\ 0 & \text{o.w.} \end{cases}$

$f_1(x) \cdot f_2(y) = \frac{2}{\pi} \cdot \frac{2}{\pi} \sqrt{(1-y^2)(1-x^2)} = \frac{4}{\pi^2} \sqrt{(1-y^2)(1-x^2)}$

$f(x,y) \ne f_1(x) f_2(y)$ (since $f(x,y) = \frac{1}{\pi}$)

Expectation of two Random. Variables   Review

① Def. $E(xy)$ is the expectation or the mean of both X and y such that :

$$E(xy) = \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} xy f(x,y)\,dx\,dy \quad \text{if } X \text{ and } y \text{ are } c.r.v.s$$

$$= \sum_x \sum_x xy f(x,y) \quad \text{if } X \text{ and } y \text{ are } d.r.v.s$$

Note : ① $E(x) \equiv$ mean of $x = \mu_x$

s.t. $E(x) = \int_{-\infty}^{\infty} x f_1(x)\,dx \quad$ if $\quad X$ is c.r.v.

$\qquad = \sum_x x f_1(x) \qquad$ if $\quad X$ is d.r.v.

② $E(y) \equiv$ mean of $y = \mu_y$

s.t. $E(y) = \int_{-\infty}^{\infty} y f_2(y)\,dy \quad$ if y is c.r.v.

$\qquad = \sum_y y f_2(y) \quad$ if y is d.r.v.

③ (a) $V(x) = E(x^2) - [E(x)]^2$

(b) $V(y) = E(y^2) - [E(y)]^2$

④ Covariance of both X & Y

We use the symbole $Cov(x,y)$ (it's mean (covariance)), s.t

$Cov(x,y) = E\{[x-E(x)][y-E(y)]\}$.

Theorem (1) If X and Y are random variables, then:

$$Cov(X,Y) = E(XY) - E(X)E(Y)$$

Proof

$$Cov(X,Y) = E\{[X-E(X)][Y-E(Y)]\}$$
$$= E\{XY - YE(X) - XE(Y) + E(X)\cdot E(Y)\}$$
$$= E(XY) - E(X)E(Y) - E(X)E(Y) + E(Y)E(X)$$
$$= E(XY) - E(X)E(Y)$$

Theorem (2) If X and Y are independent, then

$$E(XY) = E(X)E(Y)$$

Proof $\underset{\overline{OR}}{}$ $Cov(X,Y) = 0$

Case ① If X and Y are c.r.v.s

$\because$ $X \& Y$ are indep. $\Rightarrow f_1(X)f_2(Y) = f(x,y)$

$$E(XY) = \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} (X \times Y) f(x,y)\, dx\, dy$$

$$= \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} XY\, f_1(x) f_2(y)\, dx\, dy$$

$$= \int_{-\infty}^{\infty} X f_1(x)\, dx \cdot \int_{-\infty}^{\infty} Y f_2(y)\, dy \qquad \text{by Comm. Property}$$

$$= E(X) \cdot E(Y)$$

Case ② By the same method.

Note By Th.2 above, if $X \& Y$ are indep., then

$$COV(X,y) = 0$$

Example: Given a J.p.d.f.

$$f(x,y) = \begin{cases} 2 & \text{for } 0 < y < x < 1 \\ 0 & \text{o.w.} \end{cases}$$

Are $X \& Y$ indep.? (If $Cov(X,y) = 0$ Then

① By using $Cov(X,y)$
② By using $E(X \cdot y)$ ⑱ ③ $f_1(x) f_2(y)$ $X \& Y$ are indep.)
$= f(x,y)$

$$E(xy) = \int_0^1 \int_0^x xy\,(2)\,dy\,dx$$

$$= \int_0^1 \left. \frac{2}{4}xy^2 \right]_0^x dx$$

$$= \int_0^1 x \cdot x^2\,dx$$

$$= \left. \frac{x^4}{4} \right]_0^1$$

$$= \frac{1}{4} \quad ※$$

$$E(y) = \int_0^1 y^2 \left[2(1-y)\right]dy = 2\left[\frac{y^3}{3} - \frac{y^4}{4}\right]_0^1$$

$$= 2\left[\frac{1}{3} - \frac{1}{4}\right]$$

$$= 2\left[\frac{4-3}{12}\right]$$

$$= \frac{2}{12} = \frac{1}{6}$$

$$V(y) = \frac{1}{6} - \left[\frac{2}{6}\right]^2$$

$$= \frac{1}{6} - \frac{4}{36}$$

② Conditional Mean and Conditional Variance

① $f(x|y) = \dfrac{f(x,y)}{f_2(y)}$

$f(y|x) = \dfrac{f(x,y)}{f_1(x)}$

$E(y|x)$ denote to the conditional mean of Y given $X = x$.

$E(x|y)$ denote to the conditional mean of X given $Y = y$.

where $g(x) = func.\ of\ X$: $\quad E(y|x) = \int_{\square}^{\square} y\, f(y|x)\, dy$, limit of integral follows, limit of Y .

$g(y) = \dfrac{E(x|y)}{func.\ of\ y}$: $\quad E(x|y) = \int_{\square}^{\square} x\, f(x|y)\, dx$, limit of integral follows, limit of X .

Note Since $f(y|x)$ defined for interval of Y interm of X, then $E(y|x)$ is a function of X. Also $E(x|y)$ is a function of Y.

$V(y|x)$ denote to the conditional variance of Y given $X = x$.

$V(x|y)$ denote to the conditional variance of X given $Y = y$.

$$V(x|y) = \int_0^{1-y} [x-E(x|y)]^2 f(x|y)\, dx = \int_0^{1-y} \left[x - \frac{(1-y)}{2}\right]^2 dx$$

$$= \int_0^{1-y} \left[x^2 - (1-y)x + \frac{(1-y)^2}{4}\right] dx = \frac{1}{12}(1-y)^2 \quad \text{for } 0 \le y \le 1$$

Find $E(y|x)$ & $V(y|x)$ H.w   or $E(x^2|y) = \int_0^{1-y} x^2 f(x|y)\, dx$

$$V(x|y) = E(x^2|y) - [E(x|y)]^2 \qquad = \frac{x^3}{3(1-y)}\Big|_0^{1-y} = \frac{(1-y)^3}{3(1-y)} = \frac{(1-y)^2}{3}$$

$$= \frac{(1-y)}{3} - \frac{(1-y)}{2} \quad \textcircled{91}$$

Theorem (3): If X and Y are two random variables, then:

$\qquad$ a. $E[E(Y|X)] = E(Y)$, b. $E[E(X|Y)] = E(X)$

Proof: Case (1): If X and Y are c.r.v. with p.d.f $f(x)$.

$E(Y|X)$ is a function of X.

suppose that $E(Y|X) = g(x) =$ as a func of X

$E[E(Y|X)] = E[g(x)] = \int_{-\infty}^{\infty} g(x) \cdot f_1(x)\, dx = \int_{-\infty}^{\infty} [E(Y|X)] f_1(x)\, dx$

$\qquad = \int_{-\infty}^{\infty} [\int_{-\infty}^{\infty} y f(y|x)\, dy] f_1(x)\, dx = \int_{-\infty}^{\infty}\int_{-\infty}^{\infty} y\, f(y|x) f_1(x)\, dy\, dx$

$f(y|x) = \dfrac{f(x,y)}{f_1(x)} \Rightarrow f(y|x) \cdot f_1(x) = f(x,y)$

$\qquad \int_{-\infty}^{\infty} y \int_{-\infty}^{\infty} f(x,y)\, dx\, dy = \int_{-\infty}^{\infty} y\, f_2(y)\, dy = E(Y)$

Case (2): If X and Y are d.r.v. with p.m.f. $f(x)$.

$\qquad E(Y|X)$ is a function of X.

$\qquad$ Suppose that $E(Y|X) = g(x)$

$E(E(X|X)) = E(g(x)) = \sum_{x} g(x) \cdot f_1(x) = \sum_{x} [E(Y|X)] f_1(x)$

$\qquad = \sum_{x} [\sum_{y} y f(y|x)] f_1(x) = \sum_{x} \sum_{y} y\, f(y|x) f_1(x)$

$f(y|x) = \dfrac{f(x,y)}{f_1(x)} \Rightarrow f(y|x) \cdot f_1(x) = f(x,y)$

$\qquad \sum_{y} y \sum_{x} f(x,y) = \sum_{y} y\, f_2(y) = E(Y)$

b. By the same method.

Example: Given a J.p.d.f. $f(x,y)$

$f(x,y) = \begin{cases} 2 & \text{for } 0 < x < y < 1 \\ 0 & \text{o.w.} \end{cases}$

Find $E[E(Y|X)]$.

Sol.

$E(E(Y|X)) = E(Y)$ (by Theorem 3)

$E(Y) = \int_{-\infty}^{\infty} y\, f_2(y)\, dy$, $\int_0^y f(x,y)\, dx = \int_0^y 2\, dx = 2x\Big|_0^y = 2y$

$f_2(y) = \begin{cases} 2y & \text{for } 0 < y < 1, \\ 0 & \text{o.w.} \end{cases}$

$\therefore E(Y) = \int_0^1 y(2y)\, dy = 2\int_0^1 y^2\, dy = \dfrac{2}{3} y^3\Big|_0^1 = \boxed{\dfrac{2}{3}}$

Joint Distribution function (J.d.f) of two aR.V.s X and y

<u>Def.</u> The J.d.f of X and y is defined to a function such that for all values of X and y $(-\infty < x < \infty, -\infty < y < \infty)$ then:

$$F(x,y) = P(X \leq x, Y \leq y)$$

$$F(x) = P(X \leq x)$$

① $\int_{-\infty}^{x} f(t) dt$ if X is c.r.v.

② $\sum_{x_i \leq x} f(x_i)$ if X is d.r.v.

Remarks

1. $P(a < X \leq b, c < Y \leq d) = [F(b,d) - F(a,d)] - [F(b,c) - F(a,c)]$

نقارن اعلاه للمتغير العشوائي الواحد:

$\begin{cases} 1. \ F(x) = P(X \leq x) \\ 2. \ P(a < x \leq b) = F(b) - F(a) \end{cases}$

2. (i) $F_1(x) = P(X \leq x) = \lim_{y \to \infty} P(X \leq x \text{ and } Y \leq y) = \lim_{y \to \infty} F(x,y)$

    (ii) $F_2(y) = \lim_{x \to \infty} F(x,y)$

3. If X and y have (ont. J.d.f $F(x,y)$ with J.P.d.f $f(x,y)$, then for any values of X and y the J.d.f. is

① $F(x,y) = \sum_{x_j \leq x} \sum_{y_j \leq y} f(x_j, x_j)$ if X, y don't …

② $F(x,y) = \int_{-\infty}^{y} \int_{-\infty}^{x} f(r,s) \, dr \, ds$ therefore

$P(a < x < b, c < y < d)$

<u>Note</u>

* $f(x,y) = \dfrac{\partial^2 F(x,y)}{\partial x \, \partial y}$, $f(x,y)$ diff.

$F(x,y) = P(X \leq x, Y \leq y)$

Example: Given a J.d.f $F(x,y)$

$$F(x,y) = \begin{cases} 0 & \text{for } x < 0, y < 0 \\ \frac{1}{16} xy(x+y) & \text{for } 0 \leq x \leq 2, 0 \leq y \leq 2 \\ 1 & \text{for } x > 2, y > 2 \end{cases}$$

Find $F_1(x), F_2(y), f(x,y)$.

<u>sol.</u> $F_1(x) = \lim_{y \to \infty} F(x,y) = \lim_{y > 2} F(x,y) = F(x,2)$

$$= \frac{1}{16} x(2)(x+2) = \frac{x(x+2)}{8}$$

$$F_1(x) = \begin{cases} 0 & \text{for } x < 0 \\ \dfrac{x(x+2)}{8} & \text{for } 0 \le x \le 2 \\ 1 & \text{for } x > 2 \end{cases}$$

$$F_2(y) = \lim_{x \to \infty} F(x,y) = \lim_{x > 2} F(x,y) = F(2,y)$$
$$= \frac{1}{16}(2)\,y(2+y) = \frac{y(2+y)}{8}$$

$$F_2(y) = \begin{cases} 0 & \text{for } y < 0 \\ \dfrac{y(2+y)}{8} & \text{for } 0 \le y \le 2 \\ 1 & \text{for } y > 2 \end{cases}$$

$$f(x,y) = \frac{\partial^2 F(x,y)}{\partial x \partial y} = \frac{\partial}{\partial x}\left[\frac{\partial F(x,y)}{\partial y}\right]$$

$$F(x,y) = \frac{1}{16}(x^2 y + x y^2)$$

$$f(x,y) = \frac{\partial}{\partial x}\left[\frac{1}{16}(x^2 + 2xy)\right] = \left[\frac{1}{16}(2x + 2y)\right]$$
$$= \frac{1}{8}(x+y)$$

$$f(x,y) = \begin{cases} \dfrac{x+y}{8} & \text{for } 0 \le y \le 2 ,\ 0 < x < 2 \\ 0 & \text{o.w.} \end{cases}$$

H.w. ① Prove that $E(X+Y) = E(X) + E(Y)$

② — — — $E(XY) = E(X)E(Y)$

Proof ① If $x \& y$ are independent d.r.v.r.s

$$E(x_1 + x_2) = \sum_{x_1}\sum_{x_2} (x_1 + x_2) f(x_1, x_2)$$
$$= \sum_{x_1}\sum_{x_2} \left(x_1 f(x_1, x_2) + x_2 f(x_1, x_2)\right)$$
$$= \sum_{x_1}\sum_{x_2} x_1 f(x_1, x_2) + \sum_{x_1}\sum_{x_2} x_2 f(x_1, x_2)$$
$$= \left(\sum_{x_1} x_1 f_1(x_1)\right)\left(\sum_{x_2} f_2(x_2)\right) + \left(\sum_{x_2} x_2 f_2(x_2)\right)\left(\sum_{x_1} f_1(x_1)\right)$$
$$= E(x_1) \cdot (1) + E(x_2)(1)$$

$$\rho_{x,y} = \frac{Cov(x,y)}{\sigma_x \, \sigma_y} = \frac{E(xy) - E(x)E(y)}{\sqrt{\sigma_x^2} \; \sqrt{\sigma_y^2}}$$

$$\sigma_x^2 = E(x^2) - [E(x)]^2$$

$$\sigma_y^2 = E(y^2) - [E(y)]^2$$

$$E(x^2) = \frac{\partial^2 M(t_1,0)}{\partial t_1^2}\bigg|_{t_1=0} = -2(1-t_1)^{-3}(-1)\bigg|_{t_1=0} = \boxed{2}$$

$$E(y^2) = \frac{\partial^2 M(0,t_2)}{\partial t_2^2}\bigg|_{t_2=0} = -2(1-t_2)^{-3}(-1)\bigg|_{t_2=0} = \boxed{2}$$

$$\sigma_x^2 = 2 - (1)^2 = \boxed{1} \implies \boxed{\sigma_x = 1}$$

$$\sigma_y^2 = 2 - (1)^2 = \boxed{1} \implies \boxed{\sigma_y = 1}$$

$$\rho_{x,y} = \frac{1 - (1)(1)}{(1)\,(1)} = 0$$

$\therefore$ X & Y are independent (since $Cov(x,y)=0$).

<u>H.W.</u> Given a J.p.f of X & Y :

$$f(x,y) = \begin{cases} e^{-y} & \text{for } 0 < x < y < \infty \\ 0 & \text{o.w.} \end{cases}$$

<u>Find</u> : ① the M.g.f. of X,y $\left[M_{x,y}(t_1,t_2)\right]$.

② $E(xy)$

③ $f_1(x)$ & $f_2(y)$

④ $M_x = E(x)$ & $M_y = E(y)$ (by two methods).

⑤ $Cov(x,y)$.

The Variance of X or Y by using $M_{x,y}(t_1, t_2)$:

$$\text{Var}(X) = \sigma_x^2 = \frac{\partial^2 M(0,0)}{\partial t_1^2} - \left(\frac{\partial M(0,0)}{\partial t_1} \right)^2$$

$$= E(X^2) - [E(X)]^2$$

$$\text{Var}(Y) = \sigma_y^2 = \frac{\partial^2 M(0,0)}{\partial t_2^2} - \left(\frac{\partial M(0,0)}{\partial t_2} \right)^2$$

$$= E(Y^2) - [E(Y)]^2$$

Example: Let $f(x,y)$ be the J.p.d.f of X,Y:

$$f(x,y) = \begin{cases} e^{-(x+y)} & \text{for} \quad X > 0, \ Y > 0 \\ 0 & \text{o.w.} \end{cases}$$

Find the M.g.f of X, Y; also find $M_x, M_y, E(XY)$, and $\rho_{x,y}$.

Bernoulli experiment: تجربة برنولي
is an experiment that has only two
possible outcomes, event A and event A^c

For example:-
Toss a coin once.
We get H or T
H,T are only two possible outcomes.
let A: to get H
A^c: to get T
Suppose that $P(A) = p$, $0 < p < 1$
Then $P(A^c) = 1 - p$
If we repeat the Bernoulli exper.
n times. ($n \in I^+$), and if the r·v· X
$X \equiv$ number of times that A happens.
for Example :-
Toss a coine. 3 times :-
A: to get H
$X \equiv$ number of H.
$X = 0, 1, 2, 3$.

Know:-

∴ x ≡ number of times that event

IV. Gamma Distribution توزيع كاما

Def: " Gamma function Γ "

$$\Gamma(\alpha) = \int_0^\infty y^{\alpha-1} e^{-y} \quad ; \quad \alpha > 0$$

by use integration by parts we get

$$\boxed{\Gamma(\alpha) = (\alpha-1)!}$$

$$f(x, \alpha, \beta) = \begin{cases} \dfrac{x^{\alpha-1} e^{-\frac{x}{\beta}}}{\Gamma(\alpha) \beta^\alpha} & ; \quad 0 \leq x < \infty \\ 0 & o.w \end{cases}$$

Note: $f(x; \alpha, \beta)$ above is called p.d.f. for Gamma dist.

i.e

$$\boxed{\begin{aligned} & \text{if } X \sim G(\alpha, \beta) \text{ then} \\ & f(x, \alpha, \beta) = \begin{cases} \dfrac{x^{\alpha-1} e^{-\frac{x}{\beta}}}{\Gamma(\alpha) \beta^\alpha} & ; \quad 0 \leq x < \infty \\ 0 & o.w \end{cases} \end{aligned}}$$

Theorem (8) If $X \sim G(\alpha, \beta)$, then
the M.g.f. of x is
$$M_X(t) = (1 - \beta t)^{-\alpha}$$

proof:
$$M_X(t) = E(e^{tx})$$

$$M_X(t) = \int_0^\infty e^{tx} \left(\frac{x^{\alpha-1} e^{-\frac{x}{\beta}}}{\Gamma(\alpha) \beta^\alpha} \right) dx$$

$$= \int_0^\infty \frac{x^{\alpha-1} e^{-x\left(\frac{1-\beta t}{\beta}\right)}}{\Gamma(\alpha) \beta^\alpha} dx$$

let $y = \frac{x(1-\beta t)}{\beta}$; $x = \frac{\beta}{1-\beta t} y$

$$dy = \frac{1-\beta t}{\beta} dx$$

$$dx = \frac{\beta}{1-\beta t} dy$$

$$\therefore M_X(t) = \int_0^\infty \frac{\left(\frac{\beta y}{1-\beta t}\right)^{\alpha-1} e^{-y}}{\Gamma(\alpha) \beta^\alpha} \left(\frac{\beta}{1-\beta t}\right) dy$$

$$= \int_0^\infty \boxed{\frac{y^{\alpha-1} e^{-y}}{\Gamma(\alpha)} dy} \cdot \frac{\beta^\alpha}{\beta^\alpha (1-\beta t)^\alpha}$$

$$\overset{\Gamma(\alpha)}{}$$

$$\therefore M_X(t) = (1 - \beta t)^{-\alpha}$$

H·W Theorem ③ : $\text{If } x \sim G(\alpha, \beta), \text{then}$ H·W

$\mu_x = E(x) = \alpha\beta \quad ; \quad \sigma_x^2 = V(x) = \alpha\beta^2$

$$\therefore M_x(t) = (1 - \beta t)^{-\alpha}$$

$$M_x'(t) = +\alpha\beta(1 - \beta t)^{-\alpha - 1}$$

$$M_x'(t) = \alpha\beta(1 - \beta t)^{-(\alpha+1)}$$

$$M_x'(0) = \alpha\beta(1 - 0)^{-(\alpha+1)} = \alpha\beta$$

$$\therefore \mu_x = E(x) = M_x'(0) = \alpha\beta$$

$$M_x'' = -\alpha\beta(\alpha+1) \cdot (1 - \beta t)^{-(\alpha+2)} \cdot (-\beta)$$

$$= \alpha\beta^2(\alpha+1)(1 - \beta t)^{-\alpha+2}$$

$$E(x^2) = M_x''(0) = \alpha\beta^2(\alpha+1) \cdot 1$$

$$= \alpha^2\beta^2 + \alpha\beta^2$$

$$\therefore V(x) = E(x^2) - [E(x)]^2$$

$$= \alpha^2\beta^2 + \alpha\beta^2 - (\alpha\beta)^2$$

$$= \alpha^2\beta^2 - \alpha^2\beta^2 + \alpha\beta^2$$

⑤ chi - square Dist.

chi_square dist. is aspecial case of Gamma dist. , where $\alpha = \frac{r}{2}$, r is positive integer , and $\beta = 2$.
The new dist. is called chi_square dist. (denoted by $X^2(r)$) علــيـهـا
where (r) is called degree of fredom (d.f.).

Therefore , if $X \sim X^2(r)$, then the p.d.f. of X is as followings:-

$$f(x;r) = \begin{cases} \dfrac{x^{\frac{r}{2}-1} \, e^{-\frac{x}{2}}}{\Gamma(\frac{r}{2}) \, 2^{\frac{r}{2}}} & ; \text{ for } 0 < x < \infty \\[4mm] 0 & \text{o.w} \end{cases}$$

Also ; the M.g.f. of X is

$$M_x(t) = (1 - 2t)^{-\frac{r}{2}}$$

$$E(x) = M_x = \alpha\beta = (\frac{r}{2}) \cdot 2 = r$$
$$V(x) = \sigma^2 = \alpha\beta^2 = (\frac{r}{2}) 4 = 2r$$

EX: If a is v. X has a p.d.f.

$$f(x) = \begin{cases} \dfrac{x \, e^{-\frac{x}{2}}}{4} & \text{for } 0 < x < \infty \\[4mm] 0 & \text{o.w} \end{cases}$$

$$\therefore X \sim G(2,2)$$

$$\therefore \frac{r}{2} = \alpha \implies 2 = \frac{r}{2} \implies r = 4$$

$$\therefore M_x(t) = (1-2t)^{-\frac{r}{2}} = (1-2t)^{-\frac{4}{2}} = (1-2t)^{-2}$$

Example ③

A: typing errors in one page.

$X \equiv$ number of typing errors in one page (W)

$W \equiv$ interval of space

Know:

If $X =$ number of events A that happens in interval of length, then the function of X is:

$$f(x) = \begin{cases} \dfrac{e^{-\lambda w} (\lambda w)^x}{x!} & \text{for } x = 0, 1, 2, \dots \\ 0 & \text{o.w.} \end{cases}$$

———— $\underline{1}$ ————

where $\lambda \equiv$ number of event A, when $\boxed{w=1}$ & $w>0, \lambda>0$

Let $m = \lambda \cdot w$; $m > 0$, $w > 0$

$$f(x;m) = \begin{cases} \dfrac{e^{-m}(m)^x}{x!} & \text{for } x = 0, 1, 2, \dots \\ 0 & o.w. \end{cases}$$

$T = $ كل التوزيعات، A اذا $\frac{1}{w=1}$ (اكل A)

where (m) is a parameter.

Know , to show that $f(x;m)$ is a p.m.f.

Cond. ① T.P $f(x;m) \geq 0$ $\forall x \in R_x$

$m > 0$, $x \geq 0$, $x! > 0$

$(m)^x > 0$, $e^{-m} = \dfrac{1}{e^m} > 0$

$$\therefore f(x;m) = \begin{cases} \dfrac{e^{-m}(m)^x}{x!} > 0 & \text{for } x = 0, 1, 2, \dots \\ 0 & o.w. \end{cases}$$

Cond. ② T.P $\sum_{x=0}^{\infty} f(x;m) = 1$

$$\sum_{x=0}^{\infty} f(x;m) = \sum_{x=0}^{\infty} \dfrac{e^{-m} m^x}{x!} = e^{-m} \sum_{x=0}^{\infty} \dfrac{m^x}{x!}$$

$$\therefore e^x = \left[1 + x + \dfrac{x^2}{2!} + \dfrac{x^3}{3!} + \cdots \right] = \sum_{k=0}^{\infty} \dfrac{x^k}{k!}$$

$$\therefore \sum_{x=0}^{\infty} f(x;m) = e^{-m} \cdot e^{m} = 1$$

Cond. ① & Cond. ② are satisfied ; then $f(x;m)$ is p.m.f.

Note : $f(x;m)$ is called Poisson P.M.f.

Theorem (6): If X has a poisson dist. with parameter (m), then the M.g.f. of X is:

① Show that t-dist. with $r = 1$ (d.f)
and the Cauchy dist. are the same

Sol.

$$g(t) = \frac{\Gamma(\frac{r+1}{2})}{\sqrt{\pi r}\ \Gamma(\frac{1}{2})(\frac{t^2}{r}+1)^{\frac{r+1}{2}}} \qquad -\infty < t < \infty$$

When $r = 1$

$$g(t) = \frac{\Gamma(1)}{\sqrt{\pi}\ \sqrt{\pi}\ (t^2+1)} = \frac{1}{\pi(t^2+1)} \qquad -\infty < t < \infty$$

Cauchy dist.

② Let $T = \dfrac{W}{\sqrt{V/r}}$, where $W \sim N(0,1)$

$V \sim X^2(r)$

Show that $T^2 \sim F(1, r)$

Sol.

$$T = \frac{W}{\sqrt{\frac{V}{r}}}$$

$$T^2 = \frac{W^2}{\frac{V}{r}} \qquad \text{where } W^2 \sim X^2(1)$$

$V \sim X^2(r)$

$P(\bar{X} < 0) = P\left(\frac{\bar{X}-M}{\sigma/\sqrt{n}} < \frac{0-M}{5/\sqrt{16}}\right)$; $M=0$

$= P(Z < 0) = N(0) = 0.5$

Example (2): Let $\overline{X}$ be the mean of a R.S. of size 5 from a normal distribution with $M=0$ and $\sigma^2=125$. Determine C so that

$P(\overline{X}<C)=0.90$

Sol:

$$\overline{X}\sim N(0,\frac{125}{5}) \quad ; n=5 \;, M=0, \; \sigma^2=125$$

$$Z=\frac{\overline{X}-M}{\sigma/\sqrt{n}}\sim N(0,1)$$

④ Beta Distribution (توزيع بيتا)

A c.r.v. X have a Beta dist. it's p.d.f. has the following form:

$$f(x; a,b) = \begin{cases} \dfrac{1}{B(a,b)} x^{a-1} (1-x)^{b-1} & \text{for } 0 < x < 1 \\ 0 & \text{o.w.} \end{cases}$$

where $a > 0$ & $b > 0$; denoted by $X \sim B(a,b)$

And $B(a,b) = \int_0^1 x^{a-1}(1-x)^{b-1} dx = \dfrac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$

The M.g.f. of $X \sim B(a,b)$ is:

$$M_X(t) = \sum_{x=0}^{\infty} \frac{t^n}{n!} \cdot \frac{B(a+n, b)}{B(a,b)}$$

$$E(X) = \frac{a}{a+b} \quad , \quad Var(x) = \frac{ab}{(a+b)^2(a+b+1)}$$

In particular:

1. If $a = b = 1$, then Beta dist. reduces to uniform dist. on $(0,1)$:

$$f(x) = \begin{cases} 1 & \text{for } 0 < x < 1 \\ 0 & \text{o.w.} \end{cases}$$

Since $f(x, a=1, b=1) = \begin{cases} \dfrac{1}{B(1,1)} x^{1-1}(1-x)^{1-1} & 0 < x < 1 \\ 0 & \text{o.w.} \end{cases}$

$$= \begin{cases} 1 & 0 < x < 1 \\ 0 & \text{o.w.} \end{cases}$$

& $B(1,1) = \dfrac{\Gamma(1)\Gamma(1)}{\Gamma(2)} = 1 \implies \therefore X \sim B(1,1)$
$\implies X \sim \text{unif.} (0,1)$

2. If $a = 1$ & $b = 2$ then Beta dist. reduces to dist. which is known as __triangular dist.__:

$$f(x) = \begin{cases} 2(1-x) & 0 < x < 1 \\ 0 & \text{o.w.} \end{cases}$$

Theorem: If $X \sim p(m)$ & if $x_0 = $ mode of X, then

$$x_0 = \begin{cases} m, m-1 & \text{if } m \in I^+ \\ [m] & \text{if } m \notin I^+ \end{cases}$$

EX. $X \sim p(5)$ then mode $= X = 5, 4$.

$X \sim p(2.6)$ then mode $= X = 2$.

Example The percentage of betters who make money of the race on a given day has Beta distribution with parameters $a = 1$ and $b = 5$. Find the Pr. that fewer than ten percent comment winners on given day?

sol. $P(X < .1)$?

$$P(X < .1) = \int_0^{.1} \frac{\Gamma(1+5)}{\Gamma(1)\Gamma(5)} \cdot X^0 (1-X)^4 \, dX$$

$$= \frac{5!}{0! \, 4!} \int_0^{.1} (1-X)^4 \, dX$$

$$= -5 \frac{(1-X)^5}{5} \Big|_0^{.1} = (.9)^5.$$

⑦ Uniform Distribution

When X is d.r.v.

$X \sim \text{unif}(K)$

$x = 1, 2, \ldots, K$

$f(x) = \begin{cases} \frac{1}{K} & \text{for} \quad x = 1, 2, \ldots, K \\ 0 & \text{o.w.} \end{cases}$

$E(X) = \sum_{\forall x} x\, f(x)$

$\quad = \sum_{x=1}^{K} x \left(\frac{1}{K}\right)$

$\quad = \frac{1}{K} \left[\frac{K(K+1)}{2} \right] \quad \text{when} \left(\sum_{x=1}^{K} x = \frac{K(K+1)}{2} \right)$

$\quad = \left(\frac{K+1}{2} \right)$

$V(X) = E(X^2) - (E(X))^2$

$E(X^2) = \sum_{x=1}^{K} x^2 f(x)$

$\quad = \left(\sum_{x=1}^{K} x^2 \right) \left(\frac{1}{K} \right)$

$\quad = \frac{1}{K} \left[\frac{K(K+1)(2K+1)}{6} \right] \quad ; \left[\sum_{x=1}^{K} x^2 = \frac{K(K+1)(2K+1)}{6} \right]$

$\quad = \frac{(K+1)(2K+1)}{6} \quad ,$

$Var(X) = E(X^2) - (E(X))^2 \geq 0$

$$Var(x) = \frac{(K+1)(2K+1)}{6} - \frac{(K+1)}{2}$$

$$= \frac{(K+1)(K-1)}{3}$$

تحويل التوزيع الطبيعي القياسي الى $X^2(1)$

Th. $X \sim N(0,1)$ (Using Moment
       $y=X^2 \sim X^2(1)$ Teqnique)

Proof. $X \sim N(0,1)$

$$f(X) = \frac{1}{\sqrt{2\pi}} e^{-\frac{X^2}{2}}$$

$$M_y(t) = E(e^{ty})$$

$$= E(e^{tX^2})$$

$$= \int_{-\infty}^{\infty} e^{tX^2} f(x)\,dx$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{tX^2} e^{-\frac{X^2}{2}}\,dx$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{X^2(1-2t)}{2}}\,dx$$
Let $W = \sqrt{1-2t}\; X$

$dW = \sqrt{1-2t}\; dX$

$$\therefore \; M_y(t) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{w^2}{2}} \frac{dw}{\sqrt{1-2t}}$$

$$= \frac{1}{\sqrt{1-2t}} \left(\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{w^2}{2}} dw \right) = 1$$

Since $(w \sim N(0,1))$

$$M_y(t) = (1-2t)^{-1}$$

$$\therefore \; y \sim \chi^2(1)$$

Note $\qquad X \sim N(\mu, \sigma^2)$

Then $\Rightarrow$ ① $Z \sim N(0,1)$

② $Z^2 \sim \chi^2(1)$

③ $\sum_{i=1}^{n} Z^2 \sim \chi^2(n)$
