Medico-Legal Update

Editor-in Chief

Prof. (Dr) R K Sharma

Former Head, Department of Forensic Medicine & Toxicology
All-India Institute of Medical Sciences, New Delhi-110029
E-mail: medicolegalupdate@gmail.com

ASSOCIATE EDITOR

1. **S.K. Dhatarwal** (*Professor*)
Forensic Medicine, PGIMS, Rohtak, Haryana
2. **Dr. Adarsh Kumar** (*Additional Professor*)
Forensic Medicine, AIIMS, New Delhi
3. **Dr. Vijaynath V** (*Associate Professor*)
Forensic Medicine, Vinayaka Mission Medical college, Tamil Nadu
4. **Ms. Roma Khan**, Forensic Sciences, INSAAF Mumbai
5. **Dr. Imran Sabri** (*Assistant Professor*)
Department of Bio-Medical Sciences, College of Medicine, King Faisal University, Saudi Arabia

INTERNATIONAL EDITORIAL ADVISORY BOARD

1. **B. N. Yadav** (*Professor*)
Forensic Medicine, BP Koirala Institute of Medical Sciences, Nepal
2. **Dr. Vasudeva Murthy Challakere Ramaswam** (*Senior Lecturer*)
Department of Pathology, International Medical University, Bukit Jalil, Kuala Lumpur, Malaysia
3. **Babak Mostafazadeh** (*Associate Professor*)
Department of Forensic Medicine & Toxicology, Shahid Beheshti University of Medical Sciences, Tehran-Iran
4. **Dr. Sarathchandra Kodikara** (*Lecturer*)
Forensic Medicine Department of Forensic Medicine, Faculty of Medicine, University of Peradeniya, Sri Lanka

NATIONAL EDITORIAL ADVISORY BOARD

1. **Prof. N.K. Agarwal** (*Professor*) Forensic Medicine, UCMS, Delhi
2. **P.K. Chattopadhyay**, (*Professor*)
Forensic Sciences, Amity University, Noida
3. **Dalbir Singh** (*Professor*) Forensic Medicine, PGIMER, Chandigarh
4. **Dr. Harish Pathak**, Mumbai
5. **J. Gargi** (*Professor*) GGS Medical College, Faridkot
6. **P.C. Dikshit** (*Professor*)
Forensic Medicine, Jamia Hamdard Medical College, New Delhi
7. **Anil Mittal** (*Professor*)
Forensic Medicine, Vardhman Mahavir Medical college, New Delhi
8. **Balbir Kaur** (*Professor*)
Forensic Medicine, MM institute of Medical Sciences, Ambala
9. **Mukesh Yadav** (*Professor*) Forensic Medicine, School of Medical Sciences and research, Greater Noida
10. **T.K.K. Naidu** (*Professor*) Forensic Medicine, Prathima Institute of Medical Sciences Andhra Pradesh
11. **S. Das** (*Professor*) Forensic Medicine, Himalayan Institute of Medical Sciences Dehradun
12. **Col Ravi Rautji**, Forensic Medicine, Armed Forces Medical College, Pune
13. **Dr. Manish Nigam** (*Professor and Head*)
Department of Forensic Medicine & Toxicology Sri Aurobindo Institute of Medical Sciences, INDORE (M.P.)
14. **Dr. Shailesh Kudva** (*Principal*)
Rajasthan Dental College and Hospital Jaipur-302026
15. **Usmanganishah Makandar** (*Associate Professor*)
Anatomy, AIMS, Bhatinda
16. **Dr. Pratik Patel** (*Professor and Head*) Forensic Medicine, Smt NHL Municipal Medical College Ahmedabad
17. **Basappa S. Hugar** (*Associate Professor*)
Forensic Medicine, Ramaiah Medical College, Bangalore

NATIONAL EDITORIAL ADVISORY BOARD

18. **Dr. Vandana Mudda** (*Awati*) (*Associate Prof*)
Dept of FMT, M.R. Medical College, Gulbarga, Karnataka, India
19. **Dr. HarishKumar. N.** (*Associate Professor*)
Dept. of Forensic Medicine, Sri Siddhartha Medical College, Tumkur
20. **Dr. Gowri Shankar** (*Associate Professor*)
Forensic Medicine, SNMC, Bagalkot
21. **Dr. Manjunath Badni** (*Reader*) Dept of Oral pathology Maharana Pratap college of Dentistry and Research Centre, Gwalior
22. **Dr. L.Ananda Kumar** (*Associate Professor*) Forensic Medicine, Rajiv Gandhi Institute of Medical Sciences, (RIMS), Kadapa
23. **Dr. Ramesh Nanaji Wasnik** (*Associate Professor and Head*)
Forensic Medicine Late B.R.K.M. Govt. Medical college, Jagdalpur
24. **Dr. Sachin Sinha** (*Reader*), Dept. of Oral Pathology & Microbiology
Daswani Dental College & Research Centre, Rajasthan
25. **Dr. Sasi Kanth**, *Asst. Professor*, A.C.S.R Government Medical College, Nellore, Andhra Pradesh.

Medico Legal Update is a scientific journal which brings latest knowledge regarding changing medico legal scenario to its readers. The journal caters to specialties of Forensic Medicine, Forensic Science, DNA fingerprinting, Toxicology, Environmental hazards, Sexual Medicine etc. The journal has been assigned international standard serial number (ISSN) 0971-720X. The journal is registered with Registrar of Newspaper for India vide registration numbers 63757/96 under Press and Registration of Books act, 1867. The journal is also covered by EMBASE (Excerpta Medica Database) from 1997 and by INDEX COPERNICUS, POLAND. Medico legal update is a half yearly peer reviewed journal. The journal has also been assigned **E-ISSN 0973-1283 (Electronic version)**. The first issue of the journal was published in 1996.

CONTENTS

Volume 20, Number 1

January-March 2020

1. An Autopsy Study of Cranio-Cerebral Injuries Due to Road Traffic Accidents..... 1
Gandla Bala Maddileti, A.Dominic Infant Raj, Rajendra Kumar, Gajula Mahesh, Yamini.K
2. Age Estimation from Radiological Evaluation of Epiphyseal Union of Related Bones Around Elbow Joint: A Cross Sectional Study from Central India (Chhattisgarh) 7
Aloke Mazumder, Ninad Nagrale
3. Manufacturers' and Endorsers' Liability : 'Shifting the Onus' Approach 13
Amrita Mishra, Amruta Das
4. Crossword Puzzle: An Innovative Assessment Tool to Improve Learning of Students in Forensic Medicine18
Harish Kumar Agarwal, Aparna Singhal, Arvind Kumar Yadav
5. A Study to Assess the Patients Compliance to Medications among Hypertension Patients at Selected Areas in Kanchipuram District Tamilnadu..... 23
M.Kalki, S. Mohana Priya, N.Thivya
6. Restrictions Imposed by Human Biology in Achievement of Gender Justice as Human Rights..... 26
Parul Yadav, Komal Vig
7. Knowledge & Perception Of Medical Students Towards The LGBT (Lesbian, Gay, Bisexual & Transgender) Patients & Their Rights: A Cross Sectional Study..... 31
Ninad Nagrale, Pawan Wankhade, Bhupendra Gathe, A.P.Dongre
8. Causes and Factors in Road Traffic Accidents at a Tertiary Care Center of Western Uttar Pradesh..... 38
Pradeep Kumar Agarwal, Pranav Kumar, Harnam Singh
9. Toxicological Trends of Poisoning in a Tertiary Care Center of Western Uttar Pradesh 42
Pradeep Kumar Agarwal, PranavKumar, Harnam Singh
10. A Study on the Cause of Death Due to Burn Cases and Histopathological Changes in North Indian Setting-A Cross Sectional Study 47
Pradeep Kumar Yadav, Richa Choudhury, Anoop Kumar Verma, Mousami Singh, Raja Rupani, Sangeeta Kumari, Rajiv Ratan Singh
11. Client Satisfaction and Preferences Towards Nonverbal Communication(NVC) of Health Care Providers in a Therapeutic Setting, Mangaluru 51
Sonia Sequeira, Precilla D'Silva
12. Querying the Dataset from the Developed Ontology for Swineflu Disease..... 57
Radhika Pathi, Suresh Verma Penumatsha, Lakshmi Kalyani Neerukonda, P.Rama Krishna

II

13. Constitutionality of Attempt to Commit Suicide- Unlocking The Controversy 63
Smita Satapathy, Madhubrata Mohanty
14. Perspective on the Immorality of Honor Killings – A Review Article 67
Sneha.S, Smriti Sarathi, P.Sampath Kumar, Rajesh.R, Jagdish Kamal Chander.U
15. International Humanitarian Approach on ‘Identity Crisis’ of LGBTQ: A Global Perspective..... 72
Amruta Das, Amrita Mishra
16. Direction of Environmental Virtue an Epilogue: A Critical Analysis of 19th Century Case Laws 77
Annapurna Pattnaik
17. A Study on Pattern of Intracranial Injuries in Cases of Fatal Head Injury..... 82
Arulmathikannan M, Jagdish Kamal Chander U., Priyadarshee Pradhan, Sneha.S, P. Sampath Kumar
18. A Post-mortem Observational Study of Suspicious Deaths in Married Females Aged 30 Years or Less 86
J. P. Kachhadia, J. A. Tanna, V. R. Patil
19. Study of Various Osteometric Parameters of Human Mandible in Adult and Elderly Age Groups..... 91
Priyamvada Kurveti, Dheeraj Singh Verma, Jayanthi Yadav, B.P. Dubey
20. Estimation of Stature from Footprint Length 96
Janarthanan. R , Muthamizh Selvan P
21. Assessment of Knowledge and Attitude of Adolescents Regarding Blood and Organ Donation in Selected Rural Areas of Shimla, Himachal Pradesh, India 101
Jinu.K.Rajan
22. Non-Invasive Method of Measuring Blood Sugar in the Early Stage and Diagnose the Result Using Discrete Wavelet Transform..... 106
N.D Bobby, N.Prabhakaran, J.Thameema Begum, M.MuniReddy
23. Knowledge about Legal Aspects of Medical Negligence in India among Dentists– A Questionnaire Survey 111
P.K.Uma, Pratibha Ramani, Herald. J. Sherlin, Gheena.S, Gifrina Jayaraj, K.R. Don, Archana Santhanam
24. Nasal Height as a Parameter for Stature Estimation & Sex Differentiation in Dehradun Region 116
Jyoti Barwa, Rattan Singh
25. Study oof Suspicious Deaths in Middle Aged Married Females..... 122
J. P. Kachhadia, S. B. Bhatt, V. R. Patil
26. Quality of Life among Patients with Hypertension at Selected Tertiary Hospital In Kelambakkam, Kanchipuram District, Tamil Nadu, India 127
Lenin Ezhilarasu.J, Parasuraman. P, Sathiya priya.V
27. Effectiveness of Information Booklet on Knowledge, Practices and Willingness Regarding Recycling of Solid Household Waste Management among Residents..... 130
Seeta Devi, Roya Nemati, Petronella Natah, Rehu Rajan, Sumit Rane
28. A Study “To Assess the Level of Knowledge on Swine Flu Among Adults in Selected Area at Poonchery, Kanchipuram District, Tamilnadu 135
N.William Raj, R.Bhuvaneshwari, Shenbagaprabha.N

29.	The Effectiveness of Video Assisted Teaching on Fire Safety among School Children at Selected School, Kanchipuram District, Tamilnadu	138
	<i>Moses Rathnakumar, Shruthi P, L.Lakshmi</i>	
30.	Lilliputian Neglected Happenings Call For Snafu: “Theory of Broken Windows”	141
	<i>Shyamantak Misra, Prabir Kumar Pattnaik</i>	
31.	Self Determination and Indigenous People: The Fight For ‘Commons’	144
	<i>Swati Mohapatra</i>	
32.	A Descriptive Study to Assess the Knowledge on Fast Food Eating among Adults in Selected Urban Community Kanchipuram District Tamil Nadu	149
	<i>T. Yaazhini, K.Vishwanathan, N.S Shakthivel, M.Yagajeyanthi</i>	
33.	A Three Year Study of Skull Fracture Patterns in Fatal Road Traffic Accidents in a Tertiary Care Hospital Mortuary in Imphal From 2015-2018	152
	<i>Th. Meera Devi, Memchoubi Ph., Haobijam Rita Devi</i>	
34.	Intracranial Meningioma Aggressivity Image and Level of Malignancy in Head Magnetic Resonance Imaging (MRI).....	158
	<i>Vony Tjandra, Sri Andreani Utomo, Ulinta Purwanti, Dyah Fauziah, Hari Basuki</i>	
35.	Practice and Perceived Barriers among Health Care Workers to Control Infection in Dialysis Unit.....	165
	<i>Jackline Prathibha, Daisy Josphine Lobo, Shalini G Nayak, Vandana KE</i>	
36.	Profile of Medicolegal Autopsy Cases at Tertiary Care Centre in Belagavi, Karnataka. A One Year Retrospective Study	170
	<i>Khaja Azizuddin Junaidi, Somashekhar S Pujar, Ravindra S Honnungar, Prasanna S Jirli, Vishal V Koulapur, Kashif Ali, Pushpa M.G</i>	
37.	Accuracy of Demerjian Age Estimation Method in South India Kadapa [A.P] Population-A Cross Sectional Study	175
	<i>Prem Kumar Moode, L Ananda Kumar, Ramesh Mittapelly</i>	
38.	Iatrogenic Factors and Oral Health.....	180
	<i>Asma Usmani, Chavi Bhati, Mayur Kaushik, Afzal Ahmad</i>	
39.	Medical Malpractice in India: A Critical Analysis of Liability and Defense Framework	187
	<i>Hiranmaya Nanda, Amruta Das</i>	
40.	Preclinical Diagnosis of Diabetes with Tongue Infrared Thermography and PSO Algorithm.....	191
	<i>A. Selvarani, G. R. Suresh</i>	
41.	Medico-Legal Profiling of Sher-i-Kashmir Institute of Medical Sciences Srinagar under Consumer Protection Laws of Union Territories of Jammu and Kashmir	198
	<i>M.Z.M. Nomani, Ajaz Afzal Lone, Faizanur Rahman Alaa K.K.Alhalboosi, Aijaj A.Raj</i>	
42.	The Prospect of Environmental Law to Achieve Healthy Environmental Development in Indonesia	204
	<i>Absori Absori, Sigit Sapto Nugroho, Anik Tri Haryani, Sarjiyati Sarjiyati, Arief Budiono, Heru Santoso Wahito Nugroho Rangga Jayanuarto</i>	

IV

43. Measurement of Lipid Profile in Fasting Persons 209
Adhraa Baqir Hassan, Hayder L. F. AL-Msaid, Arshad noori ghani Al-dujaili, Haider Salih Jaffat
44. Legal Protection of Medical Records for Hospital Patients 214
Agus Prihartono Permana Sidik, Rani Sri Agustina, Wafda Vivid Izziyana
45. Prevalence of Coronary Artery disease in Patients undergoing Non Coronary Cardiac Surgery: A Single Center Study 218
Ahmed Moyed Hussein, Bahaa Abdullah Ali, Merah Subhi Mohammed
46. Incidence of Early Complications in Laparoscopic Total Thyroidectomy Vs Open Thyroidectomy Using Breast Approach in Simple Multinodular Goiter 223
Alaa Jamel Hasin, Muslim Kandel Kadeem, Kasin Tream
47. Molecular Detection of Mutations in mtCOX1 Gene in Iraqi Patients with Aortic and Mitral Valve Diseases 228
Ali Jumaa Al-Hussona, Faizah A.W. Ahmed
48. Rubik Play Therapy Influence on the Level of Anxiety in Children Preoperative 234
Aprina, Meylani Anita Putri, Siti Fatonah
49. The Surgical Outcome of Distal Pancreatectomy for Distal Pancreatic Tumors 239
Aqeel Shakir Mahmood, Waseem M shakir, Khalid Shakir kareem
50. Condition of Houses with Smoking Habits in Patients with Pulmonary Tuberculosis 245
Baharuddin Condeng, Muhammad Syafar, Saifuddin Sirajuddin, Furqaan Naiem, Azizah Saleh
51. Diode Laser & Conventional Surgery Treatment, A Comparative Study in Anal Diseases 250
Basim Ghaib Hussein, Jameel I. Azzawi, Rabah Ali Hussein
52. Hypertension Control in Diabetic Patients 256
Bilal Jamal Kamal, Shan Nadhmi Nadhim, Muhammed Ali Khalaf
53. The importance of Post-Mortem Computed Tomography (PMCT) as a Complementary Diagnostic Technique to Traditional Autopsy in a Case of Asphyxia Related-Death 262
Del Fante Z., Di Fazio N., Quattrocchi A., Fazio V., De Matteis A., Arcangeli M., La Russa R.
54. The Effect of Soot Particulate towards MAPK Expression in the Mechanism of Cardiovascular System Disruption 267
Dodit Yutanto
55. Synergy of Government and Regional Government Authority in Providing Health Guarantee for Communities in Indonesia 273
Fatkhul Muin, Rully Syahrul Mucharom, Wafda Vivid Izziyana
56. Evaluation the Relation between School Bag Weight and Backache among Primary School Pupils in Tikrit City 278
Firas Tariq Ismaeel, Wheab Faraj Dawood, Nisreen Mohammed Ibraheem, Aya Fawaz Mawlood, Ranya Jamal Mahmood
57. Helicobacter Pylori Can Cause Vitamin B12 Deficiency 284
Gufnan Kadhim Abdulkareem, Wasan Najim Abdul-Sada, Haider Kadhim Abdulkareem

58.	Detection of Parvovirus B19 Infection in Thalasemic Patients in Tikrit City, Serological Study	287
	<i>Hala Mohamed Majeed</i>	
59.	Evaluation of Titanium di oxide Nano-fillers Incorporation on Mechanical Properties of Heat Cured Acrylic Resin	292
	<i>Hasanen A.Alnamel, Ali ShyaaThedan</i>	
60.	The Effectiveness of Garcinia Mangostana L. Rind extract in Reducing Total Cholesterol Levels in Hypercholesterolemic Male White Mice.....	298
	<i>Hasyim As'ari, Asnani</i>	
61.	Role of MnSOD Val16Ala Gene Polymorphism in Changing the Level of Serum Metals in Workers Exposed to Heavy Metals in Al-Nasiriyah City	304
	<i>Hayder Hussein Jalood, Afrah Abid Maktoof, Hassan R. Al Rekaby</i>	
62.	Seroprevalence of Hepatitis A Virus (HAV) in Mosul City	310
	<i>Ismail I Daood, Radhwan Hussein Ibrahim</i>	
63.	Prostate Health Index in a sample of Iraqi patients with Prostate Cancer and Benign Prostatic Hyperplasia.....	315
	<i>Amal A. Hussein, Rayah S. Baban, Alaa G. Hussein, Saif H. Mohammed</i>	
64.	The Effect of Buzz Group Modification Method on Exclusive Breastfeeding Against Self Efficacy in Pregnant Women: A Quasi Experiment	322
	<i>Febyana Dwi Cahyantia, Lailatun Nimah, Retnayu Pradaniea</i>	
65.	The Discovery of Comorbidity Deviation in the Cervical Cancer Patients Treated by the Intravenous Pyelography Examination and Clinical Examination (Based on Federation International de Gynecologie et d'Obstetrique).....	328
	<i>Kristina Puji Rahayu, Budi Laraswati</i>	
66.	Analysis of Breastfeeding Factors: The Sunrise Model Approach	334
	<i>Meilina Azizah Nurhayatia, Ni Ketut Alit Armini, Tiyas Kusumaningrum</i>	
67.	Comparative Study to Evaluate the Antimicrobial Effect of MTAD, 17% EDTA, and 3% NaOCl- Against Enterococcus faecalis in Primary Teeth for Root Canals Therapy (in Vitro Study).....	340
	<i>Sarmad A. Hameed Sana'a Abdulrazzaq Ibrahim Suhad Al-Nasrawi</i>	
68.	Iron Oxide Nanoparticles Reduced Biofilm Formation and Detection of Imb Genes in Streptococcus agalactiae Isolated From Patients with Diabetes Mellitus.....	346
	<i>Sarween Omer Taha Rasul, Khadija Khalil Mustafa, Zirak Faqe Ahmed Abdulrahman</i>	
69.	Correlation of Nitric Oxide (NO) Sputum Level and Lung Physiology of Indoor Parking Attendant	352
	<i>Tati Sudiarti, Winariani</i>	
70.	Indications and Adverse Outcomes of Emergency Lower Segment Cesarean Section at 1 St and 2 Nd Stages of Labor at Al-Elwiya Maternity Teaching Hospital	358
	<i>Weqar Akram, Thikra N. Abdulla , Taghreed Mardan Abdullah</i>	
71.	The Determinants of the Occupational Diseases in Al-Nasiriyah Province at 2018	364
	<i>Majeed MohanThajeel Al-Hamami, Mulim Nahi, Ali A. Saadoon, Safaa Kudhaier Abbas</i>	

VI

72. Model of Women Participation in Supporting Government Policies Reducing Neonatal Mortality in Kupang District..... 371
Maria Margaretha Ulemadja Wedho, Mintje Ratoe Oedjoe, David B.W. Pandie
73. Precision of 3D MSCT Scan Diagnostics on Maxillofacial Trauma Compared to Stabilization and Instrumentation Operation Results 376
Meitty Christina Hidayati, Anggraini Dwi Sensusiati, Hari Basuki
74. Breast Cancer Risk Trends of Iraqi Women..... 383
Minen Al-Kafajy
75. Colorectal Cancer in Nineveh: Five Years Survival Rate 387
Moayad Aziz Alabdaly
76. Significance of Fingerprints in A Brutal Travel Bag Murder- A Case Report..... 393
Mohammad Ahmad Abdullah Ahmad AlSuwaidi, Abdulrahman Mohammed Obaid Almehiri, Mohammed Thani Rashid Almarri, Jassim Mohammed Abdullah Rashid, Bhoopesh Kumar Sharma
77. Detect the Infection with Rubella Virus and Toxoplasmosis in Pregnancy Causes Suffering from Early Abortion by Using Real Time PCR 397
Mohammed Ayyed Najm, Hadeel Abdelelah Abdel Razaak , HayfaaMahmood Fahad
78. Flexible Ureterorenoscopy Versus Extracorporeal Shock Wave Lithotripsy for Treatment of Lower Pole Renal Stones 403
Mohammed B. Ismail, Hasanain F. Hasan Al-Timimi, Hayder H. Alwan
79. The Effect of Glutathione versus Co-Enzyme Q10 on Male Infertility Original Study..... 409
Mohammed Hussam Mohammed Saeed Alkumait, Mohammed Mohsin Abdul-Aziz, Montadher Hameed Nima
80. Incidence and Variations of Aberrant Renal Arteries in Kidney Donors Cases..... 415
Mustafa AbdulMonamZainel, SuhelmawloodalNajjar
81. Evaluation of the Level of CXCL10 in Patients with Parainfluenza Virus Type III (HPIV3)..... 422
Noor Hameed Alkharsan, Siham Jasim Al-kaabi
82. Association between the Characteristics of Pre-Surgery Vascular Ultrasonography and the Successful Arterio-Venous Fistula Shunt Surgery as Hemodialysis Access to Patients with Kidney Disease Stage V. 429
Nurwanto, Prijambodo, Tri Wulan handarini, Windhu Purnomo
83. Prevalence of Childhood Disability in Basrah City Using the Ten Questions Too 435
Hajer Salim AlMosawi, Sajjad S. Issa, Mohamad A. Akber
84. Expression of e-NOS in Human Placentas of Idiopathic Intra Uterine Growth Restriction at Term..... 440
Mohammed E. Ghanem, Samia A. Eleiwe
85. Characteristics of Multidrug Resistant Tuberculosis in Minia, Egypt 446
Shimaa Anwer Emam, Eman Mahfouz Kasem, Amany Edward Sedhom
86. Prevalence of Uncorrected Refractive Errors Among the Internally Displaced Schoolchildren in Iraq..... 453
Rafea Allawi Fayyadh, Noor Hussain Abady
87. The Influence of Additional Food Hotong Porridge with Moringa Leaves Mixture on Improvement Nutritional Status of Children Nutritional Children..... 459
Rahma Tunny, Merryana Adriani, Bambang Wirjatmadi

88.	The Stiffness Comparison of Four-Screw versus Six-Screw Short Segment Pedicle Posterior Stabilization Instrumentation in Cyclic Axial Compression	465
	<i>Reza Rahman R, I Ketut Martiana</i>	
89.	Correlation of Aggressivity Papilloma Recurrent Respiratory Tract With Human Papillomavirus Types 6 And 11.....	471
	<i>Rizka Fathoni Perdana, Sri Herawati, Bakti Surarso, E Bimo Aksono H</i>	
90.	Investigation of IL-17F (rs763780) gene Polymorphisms in cases with Iraqi renal failure patients	477
	<i>Saja Mohammed Mohsen, Abbas Abood Farhan, Mohammed Abdul-Daim Saleh</i>	
91.	A Descriptive Study to Assess the Problem Faced by the Adolescents of Alcoholic Parent	483
	<i>Saranbharati.B, Ramya.V, Rajalakshmi, Devaki. K</i>	
92.	Demographic, Clinical and Hormonal Characteristics as Predicting Factors Affecting the Outcome of Laparoscopic Ovarian Drilling in Women with Poly Cystic Ovary Syndrome	486
	<i>Shelan Omar Jaafar, Ghada Saadulla Alsakkal, Namir Ghanim Al-Tawil</i>	
93.	Stress Perception and Stress Response against Internet Psychological Addiction (IPA) on Adolescents (Psychoneuroimmunology Approach).....	494
	<i>Siti Nurul Fajriah, Suhartono Taat Putra, Yusti Probowati, Rika Subarniati T.</i>	
94.	The Prevalence of Sperm Parameters for Infertile Males in Thi-Qar City.....	500
	<i>Sumeya Ghanawy AL-Najjar</i>	
95.	Awareness of Medico-Legal Issues among Medical College Health Professionals.....	505
	<i>Tabitha Elizabeth Thomas, Magendran.J</i>	
96.	Effect of Antenatal Exercise Teaching Program on Neonatal Outcomes During Delivery in Erbil, Iraq.....	510
	<i>Warda Hassan Abdullah, Badia Mohammed Najib</i>	
97.	Study of Dyslipidemia in Iraqi Hypertension Patients in Tikrit City	516
	<i>Zaidan Jayed Zaidan, Ahmed Moyed Hussein, Sheet Mutlak Ahmed</i>	
98.	Isolating Some Pathogenic Bacteria from Packed Milk and Detecting of Formalin in its Components.....	522
	<i>Zainab Alag Hassan, Ali Aboud Shareef, Majid Ahmed Kadhim, Abdulameer Abdullah Al-Mussawi</i>	
99.	Screening Study for Some Strains of E. Coli Collected from Five regions in Kurdistan-Iraq for its Sensitivity, Resistance and MDR against Thirteen Antibiotics	526
	<i>Asma Sumiea Afram Karomi</i>	
100.	The Role of Silver (Ag) Nanoparticles synthesis by Penicillium spp against the Toxicity of Echinococcus Granulosus in Adult Albino Male Rats	532
	<i>Ahmed Hamad Saleh Hussein A.R. Abbood</i>	
101.	Characteristics of Lower Back Pain in Pregnant Ladies in Thiqrar-Iraq.....	538
	<i>Ihsan Oudah Yasir, Suaad Rodan Shoelef</i>	
102.	Thyroid Dysfunction in Iraqi Patients with Acromegaly	541
	<i>Selman Nihad A, Rahma Abbas M, Ali Atheer Y</i>	

VIII

103. Simulation of Poly (ADP-ribose) polymerase (PARP) Enzyme with BAI Compound in the for Thyroid Cells 549
Hasan Tuhmaz Hamd
104. Advantage of Application of Topical Hyaluronic Acid in Reducing Post Tonsillectomy Pain; Cross Sectional Comparative Study 555
Ahmed Kareem Shiaan Al-Baidhani, Muthanna Saleem Abdulameer
105. Atherogenic Index of Plasma among Type2 Diabetic Patients Cross-Sectional Study In Iraq..... 560
Dalal Abd Al-Sattar Asaad, Ali Shalash Sultan, Zaid Naji Hassan
106. The relation between Serum Vitamin C and D, Calcium Intake With Obese Type 2 Diabetic Patients..... 565
Yasamin Abdul - amer Kadhum; Shaimaa D. Salman, Sabah Abdel- Hameid Abdel- Rahman, Najat Sabah A. Hameid
107. Assessment of Anti-Mullerian Hormone and Anti Ovarian Antibody in the Sera of Patients with Polycystic Ovarian Syndrome in AL-Najaf Al-Ashraf Province 570
Abbas Sahib Fakhar Al-Naffakh, Farhan Abood Risan
108. Cervical Spinal Stenosis and Risk of Pulmonary Dysfunction: Case Control Study 579
Post graduate Student Esraa Hammadi Fahad, Zainab H. Hashim, Ihssan S. Nema
109. Molecular Study of spy1258 gene in Streptococcus Pyogenes Isolated from Pharyngitis Patients in Fallujah City 585
Nada Zaidan Khalaf, Laith Moslih Najeeb, Asraa Adnan Abdul-Jalil
110. Design in line LMA-10 Photonic Crystal Fiber MZI for Detection and investigation of Beta Thalassemia 591
Layla M. Alameri, Tahreer S. Mansour, Fareed F. Rashid, Sara J. Belal
111. The Effect of Oral Magnesium Supplements on Lipid Profile and Oxidative Stress in Adult Albino Female Rats 596
Khder Najem Abdulla Muneef S. Ahmed, Saleh Mohammed R
112. Evaluation of Amateur and Professional Tattoo Removal by the Q Switched Nd:YAG Laser 600
Nibras A. A. Hindy
113. Serum Levels of Novel Biochemical Marker (Irisin) in Relation to the Duration of Type 2 Diabetes & in Cases of Type 2 diabetes with Coronary Artery Disease in Iraqi Patients Aged (40- 60 year) 606
Dunia Tahseen Nema Al-Aridhi, Khalid I.H. Allehibi, Zainab A. Razak Al-Sharifi, Muthanna Al Quraishi
114. Study the Effect of Temperature Variable on the Patient with Jaundice Stay Period inside the Incubator . 613
Husam Yahya Naser, Auns Q. Al-Neami, Yasser Ibrahim
115. The Role of Global Longitudinal Strain in Early Detection of Doxorubicin Induced Cardiotoxicity in Breast Cancer Patients 618
Wisam Abbas Hasan, Shokry faaz Al-saad, Hassan Salim Aljumaily
116. Personal Hygiene and Safety among governmental Hospitals Nurses Staff in Mosul City 624
Rami Ramadan Allo, Tameem Thamir Mayouf, Munther Natheer AL-Fattah
117. Molecular Detection for Nosocomial Pseudomonas aeruginosa and its Relationship with multidrug Resistance, Isolated from Hospitals Environment 631
Wathiq Abbas Hatite Al-Daraghi, Mohammed Sattar Abdulkadhim Al-Badrwi

118. Knowledge Assessment of Working Women Regarding Breast Cancer / Control and Prevention in Kirkuk Technical Institute	637
<i>Wafa Mahmood Jasim</i>	
119. The Effect of Esomeprazole on Cell Line Human Cervical Cancer.....	644
<i>Azal H. Jumaa, Ahmed Sami Jarad, Wissam Sajid Hashim Al Uboody</i>	
120. Evaluation of Salusin β in Patients with Prediabetes and Type 2 Diabetes Mellitus	651
<i>Sabah Hussein dayekh, Mohammed Imran Hamzah, Jelal Abid Ateaai</i>	
121. Vitamin D and its Association with the Severity and / or the Control of Asthma among Adult Iraqi Asthmatics	655
<i>Haider Abdulhameed Alqaraghuli, Hashim Mahdi Hashim,</i>	
122. Determination Enterococcus faecalis in Asymptomatic Urinary Tract Infection Associated with Diabetes Type 2 Patients in Suwayrah General Hospital-Iraq	661
<i>Ibtisam H. Al-Azawi, Mohammed H. Abbas</i>	
123. Oral Desmopressin as an Add-on Therapy for Men with Benign Prostate Hyperplasia they Suffering from Persistent Nocturia	667
<i>Firas Alquraishi Saif H. Mohammed, Yasser Al-Hakeem</i>	
124. The Practicing and Attitude of Some Medical Students at Al-Nahrain College of Medicine Towards Cosmetic Rhinoplasty	672
<i>Nibras Alaa Hussain Qais Ismaeel Kadhem, Ashraf MA Hussain</i>	
125. The Level of Serum Progesterone on the day of HCG Administration in Assisted Reproduction Cycles ...	677
<i>Adnan A.H. Albdairi, Hanan Khudheir Hussein</i>	
126. Protective Role of Quercetin plus Vitamin C on Infection of Rats with Klebsiella pneumoniae and Pseudomonas aeruginosa	683
<i>Shaimaa Khazaal Waad, Wuwood M. Al-Silaykhee, Hekmet B. Alhmadi, Aiad Gaber Areean</i>	
127. Study The Role of Selenium in The P-Selectin and E-Cadherin Serum Levels in Women with Preeclampsia	688
<i>Aysel A. Ahmed, Raid J. Al-Timimi, Enas Adnan Abdulrasol</i>	
128. Histological Sections of Pancreas and Serum Biochemical Changes in Rats after Dexamethasone and Zinc Oxide Nanoparticles Injection.....	694
<i>Ruaa M. Ali, Nada K. Abbas, Amal K. Abbas, Lamia K. Abbas</i>	
129. Study the Role of Trichomoniasis in In Vitro Fertilization (IVF) Failure	700
<i>Huda Dhaher Al-Marsomy, Faten Ahmed Hassan</i>	
130. Unexpected Adverse Medical & Surgical Health Conditions in Neonates after Elective Cesarean Sections within the Context of the Influence of Local Socidemographic Factors in Babylon.....	706
<i>Sijal Fadhil Farhood Al-Joborae, Ihab Raad Abbas Abid Ali; Fadhil Farhood Mekki Al-Joborae</i>	
131. Isolation of MRSA from Drinking water Supplies in Al-Anbar Province, Iraq.....	713
<i>Shirin Yasin Bdewi, Mohammad Hamid Kareem, Mohammed Moseleh Shwaish, Mustafa Salah Hasan</i>	
132. The Predictive Value of Red Cell Distribution (RDW) in Patients with Type 1 and Type 2 Diabetes Mellitus.....	717
<i>Huda Jabbar Dibby, Radhi Farhod Shlash</i>	

X

133. Histopathological Changes Associated with Cutaneous Leishmaniasis in Patients with Baghdad Boil/
South of Iraq 722
Amal Khudair Khalaf
134. Serum Anti-Mullerian Hormone Concentration and Function of The Pituitary-Gonadal Axis in Iraqi
Patients with Chronic Kidney Disease 727
Athraa K. Falhi, Noori M. Luaibi, Ali J. Alsaedi¹
135. Infection Control Measures for Nurses Staff Concerning with Hepatitis B and C at Hemodialysis Unit
in Hilla Hospitals 733
*Ahmed Mohammed Jasim Shlash, Nada KhazalKadhim Hindi , Mohammed Malih Radhi,
Baqer Abdulameer Abod Alshemari, Duaa Salman Abd Ali Albaghdadi, Hanan Hassan
ZoghairAlmohamadawi, Hajar Sahib Mahdi Mohammed*
136. Gingival and Salivary Changes in Correlation with Multiple Sclerosis..... 739
Esra Hassan Abd Ali, Suzan M. Abdul Raheem
137. Impact of Caring Child with Diabetes Mellitus Type1 upon Mothers at Specialized Center for
Endocrinology and Diabetes in Baghdad City 746
Khamees Bandar Obaid
138. Measures Self-Esteem among Undergraduate Nursing Students 754
Safi Alzeyadi, Saja H. Mohammed
139. Patterns of Haemoglobinopathies Diagnosed by High Performance Liquid Chromatography in
Karbala Population and Correlations between Different Hematological Parameters 759
Enass Abdul Kareem Al-Saadi, Duha Maithem Hassan, Wafaa Redha Al-Sabbagh
140. Risk Factors of Acute Otitis Media among Infants Children in Kerbala Pediatric Teaching Hospital:
A Case-Control Study 766
Hassan Abdullah Athbi , Haider Nawaf Abed-Ali
141. The impact of L-carnitine Supplement on Semen Variables and the Levels of Sexual Hormones
(Serum LH, FSH, Testosterone, and Inhibin) in Males with Infertility 772
Azzawi M.Hadi, Yassir Ismael Abbass, Mazin Anwar Yadgar
142. Assessment of the Understanding of Medical Ethics Subject among Anbar Medical Group Students 777
Waleed AT Al-Ani, Ahmed K. Al-Delaimy
143. Isolation and Identification of Facultative Anaerobic Bacteria from Feces of Pet Dogs 783
*SMA AL-Kubaisi, Omar-Althani Shareef Saed, Jassim Mohamed Suleiman, Mustafa Salah Hasan,
Maher Saber Owain, Ahmed Sami Jarad*
144. Molecular characterization of Eae and Stx_s genes for E. coli O157:H7 isolates from Calves 788
*Jassim Mohamed Suleiman , Omar-Althani Shareef Saed, SMA AL-Kubaisi, Mustafa Salah Hasan ,
Maher Saber Owain , Mohammed Ali Hussein , Ahmed Sami Jarad*
145. Estimation of Serum Cystatin-C as early marker of Kidney Dysfunction in correlation with Serum
Ferritin among β -Thalassemia Major Patients..... 792
Mohammed Abdulrazzaq Assi

146. Comparative Assessment of Patients' Satisfaction in Secondary and Tertiary Outpatients of Marjan Medical City in Babil Across Sectional Study	798
<i>Qais Ismaeel Kadhem, Ameer Kadhim Al-Humairi, Ashraf MA Hussain,</i>	
147. High Levels of Tumor Necrosis Factor-Alpha and Interferon-Gamma in Patients with Gingival Recession	804
<i>Sura Dakhil Jassim , Luma Jassim Witwit, Fatima Malik Abood</i>	
148. Efficiency of Aspergillus Species to Produce the Lipase Enzyme from Various Types of Oil Seeds	809
<i>Thakra Ahmed Hamada⁰, Raghad Saad Abdulkreem⁰, Hadeel Mizher Younus⁰</i>	
149. Seroepidemiology of Toxoplasma gondii Infection in Drivers Involved in Road Traffic Accidents in Baghdad City	814
<i>Dunya N. Ahmed, Salwa. S. Mushin, Mamdooh AR.Mohsin</i>	
150. Therapeutic Evaluation of the Partial Movement of the Center of the Nerve Bundle	820
<i>Imad Kadem Yasser, Ahmed Atshan abdalreda, Abbas mohsin Oleiwi</i>	
151. Investigating the Level of Vitamin E, C and Superoxide Dismutase in Patients with Allergic Asthma and Allergic Asthma with Helminths Infection.....	824
<i>Narjis Abdul Rahman Oudah, Ahmed A. Mohammed, Kareem S. Chead Al-Teea</i>	
152. The Role of Cytomegalovirus (CMV) and Vitamin D in Multiple Sclerosis (MS)	831
<i>Juman Khaleel Al-Sabbagh</i>	
153. Potential Factors Associated with Epilepsy among Epileptic Patients Attending Middle Euphrates Neurosciences Center - Al-Najaf City	837
<i>Sahar Adham Ali , Hayder Ibrahim Ali , Hasan Alwan Baiee</i>	
154. Acute Infective Bloody Diarrhea in Children Below Five Years Admitted to Children Welfare Hospital in Medical City - Baghdad During 2015.....	841
<i>Maral F. Thabit, Radhwan R Hussian</i>	
155. Comparison between Hypertensive and Non-Hypertensive Individuals in the Value of Response to Salt Administration.....	847
<i>K.A Al-hilali, Layth Ibrahim AL-Shibbani, Ali Ayad Jabbar</i>	
156. Effect of Lactic Threshold Exercises using us Ginseng in the Development of Some Functional Variables of the Lungs and Lactic Tolerance and the Performance of Complex Offensive Skills in Basketball Youth	851
<i>Rasha Abdul Ameer Jawad, Rana Fadhil , Hussein Menati Saget , Jaafer Ahmed Mahdi</i>	
157. Preoperative Anxiety and Fears among Adult Surgical Patients in Baghdad Teaching Hospital, Iraq.....	858

158. The Prevalence of Parasitic Infection in Domestic Chicken: A Review	864
<i>Yassir Dakheel Kremsh Alasadiy, Arshad Naji Alhasnawi, Farhan AlaAllah Eabaid</i>	
159. Hygienic Practices of Street Food Vendors and Schools in Some Iraqi Governorates	870
<i>Luay S. Khaleefah, Hayder N. Salman, Sadeq Muneer Shawkat</i>	

XII

160. Estimation of Serum Lipid Profile among Pre and Post-Menopausal Women in Baghdad City 877
Athraa Fouad Kadhuim
161. Effect of Zinc Oxid Nanoparticles on the Oxidative Stress (Malonaldehyde MDA, Lipid Peroxidation Level LPO) and Antioxidants (GSH glutation)..... 882
Nibras AL-Ibrahemi , Ruqayah Manoon Hasan , Kaiser Alslman
162. Molecular Identification of Sarcocystis Species Infection in Sheep in Karbala Governorate – Iraq 889
Saja A. M. Al-Saadi, Kawther A.M. Al-Mussawi, Hayder A. Muhammed
163. International Crimes and the Legal Basis of the International Committee of the Red Cross in Armed Conflict 896
Heba Eidan Abd Ali Jassim, Sarmad Amer Abbas
164. Physical Preventive Strategies Related to Children with Leukemia from Mothers' Perspective in Al.Basrah Province..... 901
Muntatdher Hasan Khalaf, Nuhad Mohammed Kassem
165. Incidence of Entamoeba Gingivalis and Trichomonas Tenax in Periodontitis and Gingivitis Patients Who Attended to Private Clinics in Babylon Province 906
Fadhil Hassan Alwan Al-Dulaimi , Ausama Abed Alkadhum Alajeely, Yasir Mahmood Ail
166. Iron Oxide Nanoparticles Induced Histological Alteration and Fetal Skeletal Abnormalities in the Embryo of Albino Rats..... 911
Reyim Hameid Kamel, Amel Ali AL-Taee
167. Clinical Characteristics of Headache among a Sample of Iraqi Medical and Dental Students..... 916
Noor S. Mohammed Ali , Rasha Basim
168. Antioxidants Activity of Date Seed Extraction of Some Date Varieties..... 922
Nareeman Adheem Shnaa Al Ghezi, Aum El-Basher H. J. Al-Mossawi, Ali Khudhair Jaber Al-Rikabi
169. Unemployment and Its Role in Increasing Crime Rates within the Iraqi Society..... 929
Ammar Ghali Abdulkadhim El-Eisawy
170. Treatment of Congenital Capillary Hemangioma: Review of 30 Cases in Nasiriyah (2013-2018)..... 934
Ahmed Abdulhussein Kawen, Ahmed Abdulameer Daffar
171. Is Glycosylated Hemoglobin A Marker of Infertility? Prospective Analytic Study 938
Sahar Hamzah Ali Al-Tameemi, Azhar Mosa Al-Toriahi
172. Serum Salusin- α and Salusin -b levels with some Biochemical Parameters in Patients with Major Thalassemia 943
Hiba Ali Numan, Hanaa Addai Ali
173. Isolating Liver abnormalities in CT Scan Images Using Enhancement Based Technique 949
Rabab Saadoon Abdoon , Zahraa Ali Khudair
174. Factors Affecting Self-Care Behaviors of Patients with Heart Failure 955
Zeena Q. Abdulhussein, Daa K. Abd-Ali
175. The Prevalence of Sperm Parameters for Infertile Males in Thi-Qar City..... 961
Sumeya Ghanawy AL-Najjar

176. Histological Study of Pregnant albino Rat Treated with Nickel Oxide Nanoparticles 966
Haneen M. Alsoltane, Amel A. Altaee
177. Potential Risk Factors of Breast Cancer among Women Attending Teaching Hospitals in Babylon Province 971
Hasan Alwan Baiee, Zainab Fadhil Kizar, Huda salman Jasim Suha Sheehan Jasim, Liiala Qies Raheem
178. Epidemiological Aspects of Attention Deficit Hyperactivity Disorder among pupils in Al-Hilla City – Babylon Province –Iraq 978
Adnan H. ALjothery, Hasan Alwan Baiee
179. An Accurate Breast Cancer Detection System Based on Deep Learning CNN 984
Kian Raheem Qasim, Alia Jumaa Ouda
180. The Efficacy and Safety of Cinnarizine in the Treatment of Vertigo in a Sample of Iraqi Patients in Al-Diwaniyah Province 991
Ali Najm Abdullah, Qatarulnada Khudhair Abbas
181. Catalase Gene Polymorphism in Patient with Diabetes Disease Type 1 in Karbala City 996
Abdulridha Mohammed Al-Asady, Farah A. Al-marzook, Thoalffakar A. ALhamed
182. Depression among Patients with Renal Failure Undergoing Haemodialysis Treatment in Holy Kerbala City in Iraq 1002
Ali Kareem Khudhair Al-Juboori , Intisar Abdul Ghani Khudhur, Selman Hussain Faris
183. The Use of Complementary and Alternative Medicine among Diabetic Patients in Nasiriya City 1008
Nahla Saleh Hasan, Murtadha Kadhim Yasir, Qasim Ali Khasal, Mishaal Zoori Jabbar, Abdulrahman Abbas Jasim, Ied Al Sadoon
184. Testosterone and Progesterone Levels, Gene Expression of Androgen and Progesterone Receptors in Albino Male Rats Treated with Phenolic Flower Extract of Hibiscus Rosa - Sinensis L 1016
Rawaa S.A.AL-Azawi. , Faris N. A. Al-hady
185. Nutritional Status of Primary School Children in Babylon Governorate 1023
Ali Jaleel Asser, Hussein Jaseem Mohammed
186. Prevalence Rate of Depression among Ischemic Heart Diseases Patients in Al-Diwaneya Province / Iraq 1030
Abdul Zahra Mohammed Alkafaji, Assel Hamid Risun
187. Deposition of Ta₂O₅ Film on Commercial Pure Titanium Disk by Modified Reactive Plasma Sputtering Technique 1036
Hassan Jawad Farhan, Raghdaa Kareem Jassim, L.Thair
188. Evaluation of the Effect of Endoscopic Sinus Surgery with Medialization of Middle Turbinate 1042
Ahmed Adhab Mayan Alzubiadi, Laith ali Altimimi, Farah Salih Alaaamiri
189. Determination Knowledge of Nurses' Concerning Measurement of Blood Pressure in Emergency Department at Al –Hussein Teaching Hospital in Al-Nasiriya City 1048
Amer Muhasin Naser, Qassim Jawell Odah Abed

XIV

190. Thermal Effects of Laser Assisted Endodontic Treatment on The External Root Surface of Deciduous Teeth (in *vitro* study) 1053
Husam Turki Abbas, Hasanain Ibrahim Khaleel, Inam Oleiwi Murad, Ali Imad Al-Khassaki, Ammar Saleh Alalawi
191. Effect of Some Alcoholic Extracts in Reducing the Fat Content of the Liver Tissue in Rat 1058
Mohammed Hayder Hamad, Nahla Al-Bakri, Abdul- Razak Labi, Duha Adnan Mahmood
192. Knowledge, Attitude and Practice of Mothers to Neonatal Jaundice 1065
Aalan Hadi Al-Zamili, Zainab Allawi Saadoon
193. Measurements of Horizontal condylar inclination by using Cadiax compactII in patients with TMJ clicking before and after different treatments modalities 1071
Hayder Mahdi Idan, Fawaz D. Al-Aswad
194. DCGAN for Handling Imbalanced Malaria Dataset based on Over-Sampling Technique and using CNN1079
Liqaa M. Shoohi, Jamila H. Saud
195. Seroprevalance of Toxoplasmosis Gondii Infection among Pregnant Women in Karbala Governorate 2014-2017 1086
Radha. M. Lefta, Enaas K. AL-Khalide, Murtadha Kanim A. AL-Jebory
196. Fasting Versus Non-Fasting in Assessing Lipid Profile and Complete Blood Picture 1091
Wasan A. Wahab Alsiadi, Abed Sultan Hassan, Malak A. Al-yawer
197. Zinc Deficiency is Associated with Meprin a in Iraqi Patients with Crohn's Disease 1097
Fatima A. Mohammad, Fatin Fadhel Alkazazz, Sura A. Abdulsattar
198. Knowledge Attitudes and Barriers of Undergraduate Medical Students Towards Research in University of Babylon 1103
Nadia Hussein Sahib, Hasan Alwan Baiee, Hadi Mohammad Ali Al mosawi, Zaid Amjed Al-husseini
199. Macrophage Migration Inhibitory Factor (MIF) Gene Polymorphism of Urothelial Carcinoma Patients in Iraq 1110
Ishraq Abdul Ameer Salih
200. Study Impact of Hyperuricemia on the Occurrence of Atrial Fibrillation in Patients Admitted to CCU in Al-Diwaniyah Teaching Hospital 1114
Mazin Zamel Al-Shibani, Hend Saddam Asmaaeel
201. Quality of Life of Parents Having Cancer and Non-cancer Children: A Comparative Study 1119
Awayi Ghazy Abdulkareem, Zhian Salah Ramzi, Jamal Ahmad Rashid
202. Sleep habits and Physiological Penal Gland Calcification (A Magnified Topographical Evolution Study) 1124
Sattar R. AL-Esawi, Ashwan Abdulzahra Hashim, Zhraa Ayad Jabber, Riyadh W. AL-Esawi
203. Investigation of Microbial and Mineral Contamination of Imported Meat 1131
Haider Mashkoor Hussein
204. The Distribution of Hepatitis C Virus Genotypes, Viral Load and Antibody Titer among Iraqi Chronic Hepatitis Patients 1136
Abdel Wahab A. R. Alshaikhly, Zaidoon A. Musa, Ban J. Qasim, Haider F. Ghazi, Wisam J. Mohammed

205. In Vitro Cytotoxicity of Total Alkaloid Extract from *Peganum Harmala* L. Seeds 1143
Hala M. N. Al- Saily, Rabab Omran
206. Psychological Factor Affecting on Performance Thinking among the Pupils: Mentally or Spiritually Concerned with the Aspects in Students' Acquisition 1148
Huda Salem Abdul Hussein, Khaled Rahi Hadi, Saad Hassan Alawi
207. Determination of the Critical Care Nurses Knowledge Toward Enteral Tube Feeding in AL-Hilla Teaching Hospitals (Interventional study) 1153
Kathreen Mohammed Aziz, Sahar Adham Ali
208. Molecular Detection of Pathogenic *Entamoeba histolytica* based on *Amoebapore C* Gene in Fecal Samples of Camels from Babylon Province, Iraq 1158
Qassim Jawad Ameer, Nawras Abdul Bari Madlo'
209. The Role of Hyperglycemia and Coexisting Hypertension in The Development of Diabetic Nephropathy in Type II Diabetes Mellitus 1161
Kadhim Abbas Al-Hilali , Mosa Jaafar Mosa, Ahmed Ali Hussein
210. Risk Factors for Congenital Anomalies in Neonatal Intensive Care Unit in Baghdad City..... 1168
Khatam M. Al-Musawi, Adraa H. Shawq, Zainab Majeed, Shahad Zaid, Huda Ibraheem
211. Genetic Polymorphisms of Catalase Enzyme with Hypertension Patients in Babylon Governorate..... 1175
Hussam Abbas Dawood , Farah A. Al-marzook , Rabab Omran
212. Comparison Study of Major Thalassemia, Thalassemia Intermedia of Iraqi Patients and Control Groups for Effectiveness of Liver Enzymes..... 1181
Shatha H. Jwaid, Abbas Mehsen Gata
213. Prevalence of Stress and Coping Behaviors among Medical Students at University of AL-Qadisiyah 1185
Mohammed AL-Zobaidy, Adyan Mostafa, Zahraa Hussien, Mariem Humed Redah, Tagreed Adnan, Haneen Mohammed
214. Assessment of Self-Esteem among Patients with Major Depressive Disorder in Sulaimani City 1191
Taha Ahmad Faraj , Salwa Shakir Muhsin
215. Evaluation of an Education Program for Elementary School Teachers Regarding Post-Traumatic Stress Disorder among Pupils in Mosul City..... 1198
Nawaf Mohammed Dhahir, Saja Hashem Mohammed
216. Histological Changes in Liver Tissue Resulting from Hydatid Cyst Infection: Comparison between Sheep and Cattle in Iraq..... 1205
Intidhar Mohammed Mnati, Baydaa Hussain Mutlak, Noora Dhyaaldain Abed
217. The Effect of Special Exercises by Using Training Methods to Assist in the Development of Some Motor Abilities and Handstand Skill of Still Rings for Young People 1211
Anmar Atshan Khargan, Sadeq Yyousif Muhammad, Hekmat Abdul Sattar Alwan
218. Psychological Analysis of Jenang Kutei Judges in Delivering a Verdict of Matai Bilai and Cuci Kampong (Purification Ritual) in Rejang Lebong Regency, Bengkulu Province, Indonesia 1217
Emma Ellyani , Khudzaifah Dimiyati, Absori Absori, Kelik Wardiono, Arief Budiono

XVI

219. Mechanism of Family-coping in Treating Patient with Schizophrenia Viewed from Factors that Affected it at Public Health Center of Balowerti, Kediri 1222
Byba Melda Suhita, Prima Dewi Kusumawati, Heri Saputro, Ahmad Yusuf
220. Effectiveness of Stress-Adaptation and Cognitive Behavior (SACB) Model for Independent Health Recovery for Clients with Coronary Heart Disease in the Community 1228
Heni Nurhaeni, Ratna Aryani, Suryati B., Ani Nuraeni
221. The Influence of Massage Therapy on Children Body Temperature which Fever..... 1235
Lia Herliana, Ai Cahyati
222. Celiac Disease in Children with Short Stature (Incidence and Morphometric Study)..... 1241
Mohammed Abdul-Aziz. Hayawi
223. Association of Periventricular Edema Thickness and Optical Perineal Thickness in Hydrocephalus Non Communications by Magnetic Resonance Imaging Examination..... 1248
Noor Anita Humaira, Sri Andreani Utomo, Hari Basuki
224. Outcome of Open Intraperitoneal Dual Mesh Versus on-Lay Mesh for Incisional Hernia Repair 1253
Jassim Mohammed Auib Al Taha
225. Teachers' Knowledge Regarding Attention-Deficit Hyperactivity Disorder between Pupils at Elementary Schools in Mosul City 1259
Mohammed Ahmed Sultan Al-Wily, Luay Amjed Mahmood Al-Waly, Radhwan Hussein Ibrahim
226. Antibacterial Properties of New Cement Based Capping Material Prepared from Egg Shell and Biopolymer (Chitosan) 1265
Hemn M. Sarmamy, Dara H. Saeed
227. Bow tie Model of Palliative Care as an Early Approach to Providing care for Patients with Heart Failure..... 1272
Hossein Jafarizadeh, Yaser Moradi, Alireza Rahmani, Amir Mohammad Amini
228. Community Acquired Pneumonia; Chest X-Ray Findings in Three Different Times 1276
Kosar Mohamed Ali
229. Variation of Alkalinephosphatase and Transaminases Levels in Different Trimesters of Pregnancy Iraqi Women 1283
Tariq Hafdhi Al-khayat and Rawaa Muayad Al-Quzweny
230. Based Assistance Continuum of Care Can Increase Family Independence in Overcoming Health Problems Pregnant-Women 1289
Rita Yulifah
231. Overweight and Obesity Associated Factors among High School Students: A Cross Sectional Study in Erbil 1296
Sarhang Qadir Ibrahim, Tariq S. Al- Hadithi, Kameran Hassan Ismail
232. The Influence of Disaster Counseling with Animation Video on Preparednes Students in Elementary School in Palu..... 1302
Imtihanah Amri, Ansariadi, Ridwan Amiruddin, Sukri Palutturi, Anwar Mallongi, Rosmala Nur, Nur Endang Sari

233. The Influence of Breathing Ball Technique on Length of Labor in Phase I Active in Independent Practice, Midwifery Sriwati..... 1307
Muliani, Hastuti Usman, Aspia Lamana, Abd Farid Lewa, Andi Ritna Marumu, Nasrul, Anwar Mallongi
234. Cardiac Emergency Prevention Through Personal and Environmental Factors 1312
Bambang Guruh Irianto, Loetfia Dwi Rahariyani
235. Investigation of cpa. and zpx. Genes in Cronobacter sakazakii Isolation from Clinical Specimens in Thi-Qar Province and 1318
Karrar Khalaf Al-aawadi, Qasim Hassan Weda'a
236. Comparison of Hemorrhoidectomy by Ligasure with Conventional Milligan Morgan's Hemorrhoidectomy..... 1324
Raisan Mahdi Shoramah Aljabery, Adil Abdul Samad Jaber
237. Women's Reactions and Health Disorders Caused by Abuse During the Pregnancy-Postpartum Period.. 1329
Rosmala Nur, Siti Ika Fitriyah, Anwar Mallongi
238. The Culture and Age of First Marriage on Female Teenagers in West Marawola..... 1335
Rosmala Nur, Muh. Asep Dwitama, Muh. Fadly Nurhaya S Patui, Sitti Radhiah, Elvaria Mantao, Anwar Mallongi
239. Mother's Behavior in Pregnancy-Puerperal Treatments and Reproductive Health Disorders..... 1341
Rosmala-Nur, Sulaeman Mamar, Indah Puspasari Kiay Demak, Elli Yane B, Radiah, Muh.Rusydi, H, Erina Thursina R,
240. The Influence of Wedge Sea Hare (*Dolabellaauricularia*) Extract and Papaya Juice on Hemoglobin (Hb) and Ferritin Levels of Mice Strain (Balb / C) with Anemia..... 1347
Sultan Akbar Toruntju, La Banudi, Purnomo Leksono, Mochammad Rahmat, Wa Ode Salma
241. The Relation between Psychological Empowerment and Job Satisfaction among Nurses 1353
Rifaie Yaseen Hameed Al-Hussein
242. Estimation the Level of Follicular Fluid Follistatin in Women Undergoing Intracytoplasmic Sperm Injection..... 1360
Baydaa Lateef Hameed, Mutaz Sabah Ahmeid, NihadKhalawe Tektook, Hashim Abdulsattar Jabar
243. Serum α -Klotho Level in the Patients Subjected to Hemodialysis in Association with Lipid Profile 1366
Hibah Hasan Ibrahim, Mutaz Sabah Ahmeid, NihadKhalawe Tektook, Hashim Abdulsattar Jabar
244. Molecular Detection of Some Antibiotic Resistant Genes of Bacteria Isolated from Bloodstream Infections of Hemodialysis Patients 1373
Najlaa Bakr Shaker, Khalid Omar Mohammed Ali
245. Assessment of Butchers Attitudes and Practices Toward Food Safetyin Thi-Qar governorate in Iraq 1379
Sameeha Naser Abed, Zahraa Zuhir
246. Nutritional Status for Patients with Hypertension in Hemodialysis Units at Baghdad Teaching Hospital. 1386
Shaymaa M. Hussein
247. Relation of Epstein Barr virus with Interleukin-6 Level among Women with Breast Cancer in Ramadi City 1393
Arkan AbdullahAbbas, Israa Hashim Saadoon

XVIII

248. Assessment of Nutritional Status of Under Five Years Children in Relation to Their Birth Space in Shirqat City 1399
Enas AbdulahYaseen, Nahid Ahmed Hassan
249. Detection of blaCTX-M gene in Klebsiella sp. Causing UTIs in Al-Yarmouk Teaching Hospital..... 1404
Marwan Majeed Ibrahim, Ammar Hameed Howaidy, Abeer Nahy Hamdy
250. Alterations in Antioxidants and Trace Element with Interleukin 6 Level in β Thalassemia Major Patients..... 1410
Janan I. Mohammed, Shihab A. Al-Bajari, MotazA.AL.Akashe, Alaa N. Totanjee
251. Overweight BMI with and without Regular Exercise in Secondary School Students in Tikrit City 1416
Athraa Essa Ahmed, Shaimaa Essa Ahmed
252. Genotyping Diversity of Echerichia coli isolated from UTI in Iraqi Patients..... 1421
Tabarek Saeb Sabri, Amal A.Kareem
253. Evaluation of the use of HbA1c in the Diagnosis of Impaired Fasting Glucose..... 1428
Raid D. Hashim; Israa Nathir; Shayma Salman Ali
254. Evaluation the Serum Level of Melatonin in Iraqi Patients with Polycystic Ovarian Syndrome 1434
Ahmed Abduljabbar Hameed, Mutaz Sabah Ahmeid
255. Relation of Some Heavy Metals with Male Infertility 1440
Hussein M. Ali, Qater, Al-Nada A. Kanaem, Mohammad Oda Selman
256. Immunological role of TLR-7 , IL-17A and IL-10 In a Sample of Iraqi Chronic Renal Failure Patients .. 1446
Asaal Abdul-Ghani Shyeea, Mohammed Abdul-Daim Saleh; Nihad Khalawe Tektook
257. Protective Immunity against Virulence Uropathogenic Escherichia Coli in Mice..... 1452
Hussam Sami Awayid, Saif Ali Mohammed, Adnan Kamel Shebeeb
258. Serological and Immunological Determination of Auto-Antibodies Against Myositis-Associated Antigens in Systemic Lupus Erythematosus Patients Using A Novel Immunoblot Assay..... 1459
Alaa Younis Mahdy Al-Hamadany; Manal Dheyaa Mohammed; Hussein Abid Sharqi AL-luhaibi, Zainab Adnan Hassan Hadeed
259. The Effects of HIV/AIDS Education on Knowledge, Attitude, and Satisfaction for AIDS Prevention Self Massage on College Students in Korea..... 1466
Ji Min Lee, Sung Jung Hong, Eun Hee Kim
260. The Study on the Empathy of Nurses and the Quality of Nursing Provided to Hospitalized Children Perceived by Nursing Students..... 1472
Bo-Yun Huh, Jae-Woo Oh, Mi-Ran Kim
261. Relationship between Attitudes to Child Nursing College Students Perceived Punishment, Child Abuse Awareness and Knowledge 1478
So-Ja Jeon, Jae-Woo Oh
262. Reorganization of Learning Objectives Using Ontology Technique 1484
Myung Mi Shin, Su-Jin Han, Hye-Sook Choi

263. Study on the Relationship Trend between Chronic Diseases and Oral Health according to Diabetes Treatment: Focusing on the Local Health Survey for 2015, 2016 and 2017.....	1490
<i>Hye-jeong Hwang, Kwon-Seob So, Kisang Kwon, Kyung-hee Kang</i>	
264. The Effects of Dialectical Behavior Therapy(DBT) Skill Training on Depression and Alcohol Abstinence Self-efficacy of Patients with Alcohol Use Disorder.....	1497
<i>Jung-hee Park, Se-jin Ju, Gyun-Young Kang</i>	
265. The Effect of Parenting Attitudes and Major Satisfaction on Career Decision Making Self-Efficacy in undergraduate Students.....	1504
<i>Kyung Sook Kim</i>	
266. Changes in Chemical Structure of Iopamidol Contrast Agents According to Radiation and Environmental Conditions.....	1511
<i>Beom-Hee Han, Cheong-Hwan Lim, Sung-Hun Jeong</i>	
267. Factors affecting the Post-Anesthetic Recovery Score and Length of Stay in the Recovery Room in Elderly Patients with Hypertension.....	1516
<i>Sunmi Kim, Myoungjin Kwon</i>	
268. Influencing Factors on Happiness of Nurses in General Hospitals	1523
<i>Sung-Yun Ahn, Myoung-Jin Kwon</i>	
269. Cancer Screening Findings in Korean People with Disabilities: 2016-2017	1529
<i>Soo-Kyung Bok, Youngshin Song, Ga-Won Seo, Yeon-Yong, Kim, Seongjun Ha</i>	
270. National Health Screening Program Non-Participation Rates Among Koreans with Brain Injury-Based Disabilities: 2016–2017	1533
<i>Youngshin Song, Miyoung Lee, Soo-Kyung Bok, Ancho-Lim, Yeon-Yong Kim, Seongjun Ha</i>	
271. Comparison of Ventilation Volume and Airway Pressure of an Advanced Airways in Virtual Reality Ambulance Simulation	1540
<i>Sang-Gyun Roh, Jee-Hee Kim</i>	
272. Effects of Social Support and Life Stress of Women in Climacterium on Meaning of Life.....	1547
<i>Ji-Woo Han</i>	
273. The Effect of Adult Attachment Types, Gender Role Attitude on the Heterosexual Relationship Satisfaction in University Students.....	1552
<i>Hee Jeong Kim</i>	
274. The Effects of Economic Stress, Career maturity and Major Satisfaction on the Job Stress in Third and Fourth Grade Students of University.....	1558
<i>Hee Jeong Kim</i>

An Autopsy Study of Cranio-Cerebral Injuries Due to Road Traffic Accidents

Gandla Bala Maddileti¹, A.Dominic Infant Raj², Rajendra Kumar³, Gajula Mahesh⁴, Yamini.K⁵

¹Associate Professor, ²Assistant Professor, ³Professor and Head, Department of Forensic Medicine, Trichy SRM Medical College Hospital and Research Centre, Irungalur, Trichy, ⁴Associate Professor, Department of Forensic Medicine, Govt Medical College, Anantapuram, ⁵1st year PG. Dept of Oral Pathology and Microbiology, Indira Gandhi Institute of Dental Sciences, Puducherry.

Abstract

Cranio-cerebral injuries are a morbid state, resulting from gross structural changes to the scalp, skull and the contents of the cranium. In present scenario, accidents are now considered as one of major contributing factors of Non-Communicable Diseases which have become major health problems of developing countries like India. According to the national crime bureau statistics In India, over 1,46,133 people were killed in various road traffic accidents during 2015 and the count raised to 1,50,785 in 2016. Information on the contributing factors is mandatory to reduce this burden. A prospective study of all Road Traffic accidents coming for autopsy at Government Medical College, Anantapuram. Majority of victims were male in the age group between 31-40 years. Most of them had Linear fractures of the skull along with Sub dural haemorrhage. Two Wheeler riders were the most common victims. Most of the victims died due to Cranio-Cerebral Injury. Most of the times, it is the negligence, which results in an accident. The negligence may be on the part of the victim or may be there on the part of other person who occupied the second vehicle. Sometimes innocent pedestrians are also victimized to these deaths. An accident for all practical purposes is preventable, provided if it is anticipated and proper precaution and preventive measures are adopted.

Key words : Road traffic accidents, Intracranial Hemorrhage, Skull fractures, Pedestrian

Introduction

Road traffic accidents (RTA) can be defined as “ An accident that occurred on a way or street open to public traffic; resulted in one or more persons being killed or injured and at least one moving vehicle was involved. Thus RTA is collisions between vehicles, between vehicles and pedestrians; between vehicles and animals; or between vehicles and geographical or architectural obstacles^[1] .” Road Traffic Accidents (RTA) are increasing in alarming ways. Globally nearly 1.2 million people killed in RTA during the year 2002. Developing and underdeveloped countries accounted for 80% of these deaths and 21% of total injury projected

estimations reveals that fatalities due to RTA will be the 3rd leading cause of death by 2020 moving from its present 9th position ^[2] .Developing countries are very different from the industrialized countries with regard to the environment and mix of vehicles in the traffic stream ^[3] . Number of ‘Traffic Accidents’ in the country have been increased by 3.1% (from 4,81,805 in 2014 to 4,96,762 in 2015) during 2015 compared to 2014.^[4] Road Traffic Accidents (RTAs) are an important public health problem requiring urgent attention in developing countries such as India, which has the highest proportion of deaths due to RTAs in South East Asia. One of the main causes of death and disability is road traffic injuries, with an unequal number of incidences in developing countries.^[5] In 2000, RTA were the ninth leading cause of disability-adjusted life years lost and are projected to become third by 2020.^[6] Every year, more than 20 million people are injured or disabled and 1.17 million are killed because of RTAs.^[6] In developing countries, more than 85% of the deaths and nearly 90% of the

Mobile Number: 9597483414, 9949225606

disabilities are caused by RTAs globally.^[7] In India, of the mortality of 2,123.60 from all causes, 1,463 are caused by RTA. The World Health Organization (WHO) report on Global Status Report on Road Safety, which is the first of its type, states that, with more than 130,000 deaths annually, India has overtaken China and now has the worst RTA rate worldwide.^[8]

Materials and Method

All the post-mortem examinations conducted in Ananthapuram medical college mortuary on deaths due to road traffic accidents during 2016 year were analysed. The data regarding pattern of injuries leading to death, blood alcohol levels in the dead victims, age group affected, statistics of deaths among pedestrians and two wheeler drivers were collected for analysis. The study was conducted with the permission and help of medical records section and autopsy surgeons who have done post-mortem examination in various cases of deaths due to road traffic accidents. All cases of head injuries and injuries over other parts of the body due to RTAs are taken for the study. Decomposed bodies are not included in the present study. A total number of 234 cases were studied during the year 2016. This study included detailed history regarding the incident and complete clinical history including operative procedures, if any and detailed external and internal examination of the body.

Observation and Results

The current study conducted on 234 deaths due to road traffic accidents for which autopsy done in mortuary of Anantapuram government medical college, Andhra Pradesh during the year of 2016.

Out of 234 deaths **majority victims were** males. Males accounted to 150 (64%) and females were 84 (36%). As per age wise observation 73 deaths(males 45, females 28) occurred in the age group of 31-40 years. In the age group of 41 to 50 years the number of deaths were 58 (males 37, females 22). Next age group is 21 to 30 years in which 40 deaths (males 25, females 15) occurred; in the age group of 51 to 60 years

25 deaths(males 15, females 10) occurred; in the age group of 10 to 20 years 19 deaths (males 16, females 3) occurred; 14 people (males 8, females 6)more than 61 years are also died. Whereas 4 children (males 4 and no females) less than 10 years also died. If we take up the graph the peak is rising towards 31 to 40 years age group both in males and females.

During study of distribution of injuries to other body parts, Maximum number of victims had injuries associated with other body parts (159 cases) followed by head injuries(75 cases).

In our study different types of extra cranial injuries either alone are in combination were found. Among those abrasion was found in (134) followed by contusion (94), laceration(83), fractures(31), crushing injury (8) incised(6), penetrated(4) injuries respectively.

Out of 234 cases studied, 18 were intact without any fracture of the skull. 216 cases had skull fractures. Among them linear/fissure fractures topped the list of skull fractures (112), followed by , Communitated fractures (58), Depressed (20), combined (15), sutural separation (9), crush injuries (expressed fractures) (9) and the least being the ring fractures (2) and no gutter fractures seen and these fractures found either individually or in combination with each other

After opening the skull cavity the different kinds of intra cranial haemorrhages were observed in the study group. The type of intracranial haemorrhages found either individually or in combination with each other. Among these, Subdural haemorrhage either singly or in combination with others was found in 103 head injury cases. Next comes subarachnoid haemorrhage and it was found in 93cases, followed by intra cerebral haemorrhage(14), Extra dural haemorrhage(12) intra ventricular haemorrhage(5), Pontine haemorrhage (5) Cerebellar haemorrhage(2).

It was observed in current study the cranio cerebral injury was the leading cause of death in most of the victims that is in173deaths. Followed by haemorrhagic shock in 47 victims then neurogenic shock.

Table: 1. Age and Sex wise distribution cases of fatal RTAs

S.No	Age	Male		Female		Total	
		No of cases	%	No of cases	%	No of cases	%
1	<10	4	1.71	0	0	4	1.71
2	11-20	16	6.84	3	1.28	19	8.12

3	Hemorrhagic Shock(HS)	47	20.09
4	Septic Shock(SS)	5	2.14
5	Total	234	100

Discussion

Head Injuries are more prone in road traffic accidents. These are due to the exchange of force between the body parts which are moving and the stationary hard objects present on and around the road. Or the human body may be stationary and the moving object come and hit the person wherein there is an exchange of force which results in the deformity of the body parts and the result is the injuries spread over the body surface or internal organs of the body.

The results of our study on the cranio cerebral injury due to RTA were analyzed and compared with other studies conducted at various places in India and abroad.

Table:1 in our present study maximum number of head injury victims were males in the age group of 31-40 years. The reason could be that the males of in this age group are prime earners of the family and remain outdoors during most of the day, risk taking behavior, Male dominance is explained by the fact that, males are more exposed to hazards of road. Similar results were observed in the various studies [9,10,11] while study by shamim monga et al^[12] contrasts our finding where the common age group was between 21-30 years.

Table:2 In our study injuries to other body parts also has happened along with head injury, similar finding found in study by Shobhna et al⁽¹³⁾. As most of the victims are from two wheeler accidents and pedestrians, victims had involvement of other body parts after hitting was more common.

Table:3 In present study grazed abrasion was most common associated injury either single or in combination with other injuries. Similar findings were observed in study conducted by Oberoi et al^[14]. However study conducted by Shobhna et al^[13] laceration was most common associated injury. Whenever there is a road traffic accident there is blunt force acting on the victim so it causes injuries like abrasion, contusion, lacerations.

Table:4 In regards to fracture of skull bone, we found that linear fracture was most common, similar findings were observed in studies conducted by Wankhede et al^[15], Menon et al^[16], Shobhna et al^[13]. Type of fracture occurring after vehicular accident depends on various factors e.g. speed, safety measures used, ground over which fall occurs. In severe accidents combination of fractures is observed. In another study which was carried out by kuchewar et al^[17], almost 79.87% of victims

were with skull fracture. Fracture of the vault of skull was more common than the base of the skull and most common type of fracture was linear. These results are similar to the results of our study.

Table:5 In current study, most common type of haemorrhage was subdural (either alone or with combination) which is similar to study conducted by Ravikumar et al⁽¹⁸⁾ and Arvind kumar et al⁽¹⁹⁾ while study by Wankhede et al^[15] contrasts our finding where Sub Arachnoid Haemorrhage was most common.

Table:6 in our study the commonest cause of death was Cranio Cerebral Injury, it is consistent with the study conducted by B. Srinu Naik et al.^[20]

The findings in the present study most of the vulnerable group road users are, two wheeler riders, and pedestrians. Similar findings observed in the study by Gururaj et al.^[10]. These groups of road users form the major bulk on Indian roads, and hence, their exposure is higher. Unlike occupants in cars and other heavy vehicles, these road users are directly exposed to the traffic environment,

Summary and Conclusion

The present study can be summarized and concluded as, head injury deaths due to road traffic accidents are occurring in significant number in day to day medicolegal autopsies. Among Highest number of deaths belonged to age group of 31 to 40 years with male preponderance. Majority Of Head injuries are associated with other body parts injuries and abrasion being the commonest. Linear fracture was most common type of skull fracture, and the Sub Dural Haemorrhage was the leading type of intracranial haemorrhage. Cranio cerebral injury being the commonest cause of death and two wheeler riders being the most vulnerable group of affected road users.

Age Estimation from Radiological Evaluation of Epiphyseal Union of Related Bones Around Elbow Joint: A Cross Sectional Study from Central India (Chhattisgarh)

Aloke Mazumder¹, Ninad Nagrale²

¹Associate Professor, Forensic Medicine & Toxicology, Malda Medical College, Malda (WB), ²Associate Professor, Forensic Medicine & Toxicology, Shri Shankaracharya Institute of Medical Sciences, Bhilai (CG)

Abstract

Radiological evaluation of the skeletal age represents an important tool for the estimation of the chronological age in the living. The aim of our study was to evaluate the relationship between the chronological age and degree of epiphyseal fusion around elbow joint in population of Chhattisgarh (Central India) and to compare our results with the results of similar studies. The study was carried out in 100 healthy subjects (40 girls and 60 boys) aging from 13 to 20 years. The obtained results from the radiographs revealed that the complete fusion of epiphysis of elbow joint is seen at 16-20 years. Females were consistently developing epiphyseal union at a younger age than their male counterparts. Results also suggest that the age of epiphyseal union is found to vary greatly all over the world indicating the need for separate standards of age of epiphyseal union for separate regions.

Key Words: epiphyseal union, elbow joint, distal end of humerus.

Introduction

Accurate age estimation of living persons provides an authentic official document to prove their chronological age, important for humanitarian, administrative & legal purposes. Radiographic evaluation of the skeletal age is one of the most reliable methods of the four pillars for age estimation. Nevertheless this method is only an estimate, having an inherent degree of error due to variation in human skeletal development. The aim of our study was to evaluate the relationship between the chronological age and the degree of epiphyseal fusion around elbow joint in population of Chhattisgarh (Central India) and to compare our results with the results of similar studies. Present study has been undertaken in an indigenous population of Chhattisgarh from ossification around elbow joint radiographically.

Aims & Objectives

5. To evaluate age specific difference in epiphyseal union at elbow joint.
6. To estimate age from epiphyseal union at elbow joint.
7. To compare bisexual difference in epiphyseal union at elbow joint.
8. To compare the findings in the epiphyseal union at elbow joint in Central Indian population with other parts of India on the basis of previous studies.

Material & Method

The present study was carried out in the Department of Forensic Medicine & Department of Radiology, SSIMS, Bhilai, Chhattisgarh (Central India). A total of 100 individuals participated in this study. The subjects included were students of 13-20 years of age from schools & colleges from Bhilai city. They are born to parents living in Central India and have lived here since birth. The subjects do not have any disease/deformity pertaining to bones or chronic disease affecting the general health. An informed consent was taken from all subjects prior to each investigation.

Corresponding author:

Ninad Nagrale

Associate Professor, Forensic Medicine & Toxicology, Shri Shankaracharya Institute of Medical Sciences, Bhilai (CG)

Procedure of Radiography: After taking written consent, thorough physical examination & radiological evaluation was done. X-Rays of right elbow joint were taken with the help of X-Ray machine in the Department of Radiology. Minimum shots were taken to expose the joints involved in study. Minimum & appropriate voltage settings of X-Ray machine were applied so as to avoid unnecessary radiation exposure of the subjects. All the radiological procedure was undertaken according to the

prescribed standards. Skeletal maturity was evaluated according to the Jit & Kulkarni's¹⁷ classification of four stages: Appearance, Non fusion, Partial fusion & Complete fusion ("A", "NF", "PF", "CF" respectively). The master chart was prepared and tabulated as per code given above. It was classified, analysed and compared with known standards. At the end conclusions were drawn, which were compared with available results of various previous studies.

Results

TABLE 1: Age and gender wise distribution of subjects.

Age in years	Males		Females	
	No	%	No	%
13-14	6	10	4	10
14-15	7	11.67	4	10
15-16	9	15	8	20
16-17	10	16.67	7	17.5
17-18	12	20	7	17.5
18-19	8	13.33	5	12.5
19-20	8	13.33	5	12.5
Total	60	100	40	100

Table 2: Epiphyseal Fusion of the Composite epiphysis (Capitulum and Lateral region of Trochlea, Medial region of Trochlea, Lateral Epicondyle) with shaft of humerus:

Age (years)	Males			Females		
	NF	PF	CF	NF	PF	CF
13-14	2 (3.33%)	4 (6.67%)	0 (0%)	0 (0%)	2 (5%)	2 (5%)
14-15	0 (0%)	2 (3.33%)	5 (8.33%)	0 (0%)	1 (2.5%)	3 (7.5%)
15-16	0 (0%)	2 (3.33%)	7 (11.67%)	0 (0%)	0 (0%)	8 (20%)
16-17	0 (0%)	0 (0%)	10 (16.67%)	0 (0%)	0 (0%)	7 (17.5%)
17-18	0 (0%)	0 (0%)	12 (20%)	0 (0%)	0 (0%)	7 (17.5%)
18-19	0 (0%)	0 (0%)	8 (13.33%)	0 (0%)	0 (0%)	5 (12.5%)
19-20	0 (0%)	0 (0%)	8 (13.33%)	0 (0%)	0 (0%)	5 (12.5%)
Total	60 (100%)			40 (100%)		

In males, composite epiphysis shows: non fusion in 2 (3.33%) cases in age group of 13-14 years, partial fusion in 8 (13.33%) cases in age group of 13-16 years

& complete fusion in 50 (83.33%) cases in age group of 14-20 years. Complete fusion is seen in all the subjects

in age group of 16-20 years.

In females, composite epiphysis shows: partial fusion in 3 (7.5%) cases in age group of 13-15 years & complete fusion in 37 (92.5%) cases in age group of 13-20 years. Complete fusion is seen in all the subjects in age group of 15-20 years.

Table 3: Epiphyseal fusion of Medial Epicondyle with shaft of humerus:

Males				Females		
Age (years)	NF	PF	CF	NF	PF	CF
13-14	1 (1.67%)	5 (8.33%)	0 (0%)	1 (2.5%)	3 (7.5%)	0 (0%)
14-15	0 (0%)	5 (8.33%)	2 (3.33%)	0 (0%)	2 (5%)	2 (5%)
15-16	0 (0%)	2 (3.33%)	7 (11.67%)	0 (0%)	1 (2.5%)	7 (17.5%)
16-17	0 (0%)	0 (0%)	10 (16.67%)	0 (0%)	0 (0%)	7 (17.5%)
17-18	0 (0%)	0 (0%)	12 (20%)	0 (0%)	0 (0%)	7 (17.5%)
18-19	0 (0%)	0 (0%)	8 (13.33%)	0 (0%)	0 (0%)	5 (12.5%)
19-20	0 (0%)	0 (0%)	8 (13.33%)	0 (0%)	0 (0%)	5 (12.5%)
Total	60 (100%)			40 (100%)		

In males, Medial Epicondyle shows: non fusion in 1 (1.67%) cases in age group of 13-14 years, partial fusion in 12 (20%) cases in age group of 13-16 years & complete fusion in 47 (78.33%) cases in age group of 14-20 years. Complete fusion is seen in all the subjects in age group of 16-20 years.

In females, Medial Epicondyle shows: non fusion in 1 (2.5%) cases in age group of 13-14 years, partial fusion in 6 (15%) cases in age group of 13-16 years & complete fusion in 33 (82.5%) cases in age group of 14-20 years. Complete fusion is seen in all the subjects in age group of 16-20 years.

Table 4: Epiphyseal fusion of Head of Radius:

Males				Females		
Age (years)	NF	PF	CF	NF	PF	CF
13-14	3 (5%)	3 (5%)	0 (0%)	1 (2.5%)	3 (7.5%)	0 (0%)
14-15	1 (1.67%)	6 (10%)	0 (0%)	0 (0%)	2 (5%)	2 (5%)
15-16	0 (0%)	3 (5%)	6 (10%)	0 (0%)	0 (0%)	8 (20%)
16-17	0 (0%)	0 (0%)	10 (16.67%)	0 (0%)	0 (0%)	7 (17.5%)
17-18	0 (0%)	0 (0%)	12 (20%)	0 (0%)	0 (0%)	7 (17.5%)
18-19	0 (0%)	0 (0%)	8 (13.33%)	0 (0%)	0 (0%)	5 (12.5%)
19-20	0 (0%)	0 (0%)	8 (13.33%)	0 (0%)	0 (0%)	5 (12.5%)
Total	60 (100%)			40 (100%)		

In males, Head of Radius shows: non fusion in 4 (6.67%) cases in age group of 13-15 years, partial fusion in 12 (20%) cases in age group of 13-16 years & complete fusion in 44 (73.33%) cases in age group of 15-20 years. Complete fusion is seen in all the subjects in age group of 16-20 years.

In females, Head of Radius shows: non fusion in 1 (2.5%) cases in age group of 13-14 years, partial fusion in 5 (12.5%) cases in age group of 13-15 years & complete fusion in 34 (85%) cases in age group of 14-20 years. Complete fusion is seen in all the subjects in age group of 15-20 years.

Table 5: Epiphyseal fusion of olecranon process of ulna:

Males				Females		
Age (years)	NF	PF	CF	NF	PF	CF
13-14	2 (3.33%)	4 (6.67%)	0 (0%)	2 (5%)	2 (5%)	0 (0%)
14-15	1 (1.67%)	6 (10%)	0 (0%)	0 (0%)	2 (5%)	2 (5%)
15-16	0 (0%)	3 (5%)	6 (10%)	0 (0%)	0 (0%)	8 (20%)
16-17	0 (0%)	0 (0%)	10 (16.67%)	0 (0%)	0 (0%)	7 (17.5%)
17-18	0 (0%)	0 (0%)	12 (20%)	0 (0%)	0 (0%)	7 (17.5%)
18-19	0 (0%)	0 (0%)	8 (13.33%)	0 (0%)	0 (0%)	5 (12.5%)
19-20	0 (0%)	0 (0%)	8 (13.33%)	0 (0%)	0 (0%)	5 (12.5%)
Total	60 (100%)			40 (100%)		

In males, olecranon process shows: non fusion in 3 (5%) cases in age group of 13-15 years, partial fusion in 13 (21.67%) cases in age group of 13-16 years & complete fusion in 38 (63.33%) cases in age group of 15-20 years. Complete fusion is seen in all the subjects in age group of 16-20 years.

In females, olecranon process shows: non fusion in 2 (5%) cases in age group of 13-14 years, partial fusion in 4 (10%) cases in age group of 13-15 years & complete fusion in 34 (85%) cases in age group of 14-20 years. Complete fusion is seen in all the subjects in age group of 15-20 years.

Discussion

Table 6: Showing comparison of ages (years) of union of epiphyses around Elbow joint given by various workers with findings of present study:

Present study	16-17	15-16	16-17	16-17	16-17	15-16	16-17	15-16

Composite epiphysis: The observations of present study for males, matches with works of Lal & Nat (1934)¹ in Uttar Pradesh, Nemade K et al (2007)⁸ in Vidarbha, Sidhom & Derry (1931)⁹ in Egyptians & Frazer (1958)¹¹ in Europeans. For females, the observations match with the findings of MJS Pillai (1936)² in South Indians, Galstaun (1937)³ in Bengalis, Basu & Basu (1938)⁴ in Bengalis, Lal & Townsend (1939)⁵ in Uttar Pradesh, Nemade K et al (2007)⁸ in Vidarbha & Ledger & Wasson (1941)¹⁰ in Pakistani population.

Medial epicondyle: The observations of present study for males, matches with work of MJS Pillai (1936)² in South Indians, Galstaun (1937)³ in Bengalis, Nemade K et al (2007)⁸ in Vidarbha & Ledger & Wasson (1941)¹⁰ in Pakistani population. For females, the observations match with the findings of MJS Pillai (1936)² in South Indians, Gupta et al (1974)⁶ in Uttar Pradesh, Sahni & Jit (1995)⁷ in Punjabis, Nemade K et al (2007)⁸ in Vidarbha & Ledger & Wasson (1941)¹⁰ in Pakistani population.

Radial head: The observations of present study for males, matches with work of Lal & Nat (1934)¹ in Uttar Pradesh, MJS Pillai (1936)² in South Indians, Galstaun (1937)³ in Bengalis, Gupta et al (1974)⁶ in Uttar Pradesh, Nemade K et al (2007)⁸ in Vidarbha, Ledger & Wasson (1941)¹⁰ in Pakistani population, Frazer (1958)¹¹ in Europeans & Gray (1995)¹² in Europeans. For females, the observations match with the findings of Galstaun (1937)³ in Bengalis, Lal & Townsend (1939)⁵ in Uttar Pradesh, Sahni & Jit (1995)⁷ in Punjabis, Nemade K et al (2007)⁸ in Vidarbha, Ledger & Wasson (1941)¹⁰ in Pakistani population & Frazer (1958)¹¹ in Europeans.

Ulnar Olecranon: The observations of present study for both males & female, matches with work of Galstaun (1937)³ in Bengalis.

Summary and Conclusions

9. This study was conducted exclusively on the young indigenous population of Chhattisgarh region.

10. The epiphyseal union of bones at right elbow joint in males is completed in all instances (100%) at the age of 16-20 years.

11. The epiphyseal union of bones at right elbow joint in females is completed in all instances (100%) at the age of 15-20 years.

12. As the sample size is limited, further studies are necessary. Region wise studies should be conducted for

better correlation and comparison.

13. Due to changing lifestyle pattern, dietary, climatic, behavioral factors, age of ossification is changing as mentioned in the available literature. So as to evaluate these changes, studies are recommended in every region of India at regular time period for academic and judicial interest.

14. The opinion about age should be given always in the range. From this study it can be concluded that the opinion about age can be given in a range having margin of error of 1-2 years.

15. Radiological interpretations are observer dependent so the set standards should be considered under expert guidance to arrive at conclusion in such radiological studies.

16. For estimation of age, relevant joints should be radiologically examined for different centres and opinion should be arrived considering the status of multiple centres.

Manufacturers' and Endorsers' Liability : 'Shifting the Onus' Approach

Amrita Mishra¹, Amruta Das¹

¹Assistant Professor, Faculty of Legal Studies, Shiksha 'O' Anusandhan University, Bhubaneswar, Odisha, India

Abstract

Endorsement being seen as a platform for presentation of traits and performances of a product, it draws an analogy with 'invitation to offer' with the product or service voicing their presence via celebrity personalities attracting attention. Though the case of Donoghue v. Stevenson remains the original precedent on manufacturer's negligence and absence of any contractual obligations to the consumer making him responsible towards the ultimate beneficiary, the ratio and obiter should be analysed in sharing a look-alike obligation on endorsers for injury ensuing from use of such product or service. Since the debate of Nestles' Maggi brand, there has been a look out at the existing liability regime for the celebrity endorsers of such products. In the wake of flooding consumables in the free competitive market, falsification of critical data, misleading and non-obvious statements and superficial promising results often prejudice consumers' choice as well as preference, thereby affecting their rights to claim for healthy, consumer friendly products and income justified and habit of consumerism. Moreover, being a 'ideal' 'God like' and 'larger than life' figure to common man, personalities from entertainment, sports and other popular industry invite a stricter interpretation on their 'responsibility quotient' because of the edge over other professional advertisements in terms of greater credibility and trust.

Keywords: Endorsement, Misleading advertisements, Due diligence, Consumerism, Customers, Celebrities.

Introduction

Endorsers bridge the gap between manufactures and the consumers and often create a strong and relatable emotional bond with consumers with their earned likeability, and ways of work and life and become arbiter of quality, taste and performance of products or services. With the growing effect of the social media in the purchase journey of every individual the companies too are evolving new manners of effective saleability and one of the effective methods adopted is through endorsement through different channels. And many big celebrities are associated with the giant companies to vouch for their products and brands. But where

brands are taking advantage of celebrities, by rampantly using the social median to reach the stakeholders and customers buying behaviours dependent on celebrity endorsement, the endorser possess some responsibility and have liability against their misleading products. Because the customer places a higher value on products endorsed by celebrities and it is as if they are receiving a short of advice from a brand regarding that product when the customer is a fan of the celebrity.

So the endorsers in a way increase awareness trust and familiarity of the products they are vouching for. People also believe that the products promoted by the celebrities will make them or allow them to get the traits of the particular celebrity. So the customer in a way shows greater recall of product those are endorsed by celebrities. And thus, through the endorsement of brands by celebrities and endorser, companies are taking undue advantage.

Corresponding Author:

Amrita Mishra

Assistant Professor, Faculty of Legal Studies, Shiksha 'O' Anusandhan University, Bhubaneswar-751003, Odisha, India, Email-Id: amritamishra@soa.ac.in, Mob: 9078923375.

Justification in favour of liability:

1. There is an undue influence on the “freedom to choose” of consumers.
2. A joint or vicarious liability on the celebrity is a justified step for any for any ensuing immediate damage or harm from the use of product or services by the consumers.
3. There is a shared malicious interest of the endorsers with manufacturers in money making.

Justification against Liability:

1. Endorsers are not the approval authority or testing authority and certainly lack the technical expertise on the same.
2. It is understood that the primary safety test has been done by the authority as because it has been stamped to be market ready.
3. Endorser being a mere medium of transmission of information should not be made a scapegoat.
4. There is an express and implied ‘Indemnity clause’ in the Contract between the manufacturers and endorsers justifying a compensatory
5. The age old revolutionary concept of ‘Caveat Emptor’ puts a responsibility on consumers’ shoulder to be informative.

Liability of the celebrities for the claims made by them in advertisements: The question of liability of the celeb-endorser for the lapses of a manufacturer is long been debated ever since Nestles Maggie brand of instant noodle had quality issues and the product falling the foul of food testing authorities was banned by the Food Safety and Standards Authority of India.¹

An extremely important legal debate has been raised concerning the liability of endorsers. Various legal experts opine that even if the celeb-endorsers are made liable under certain provisions of existing legal provisions, it becomes difficult to prove the presence of clear intent to harm anyone via the endorsements they are making in respect of the deficient product. The rights and obligations of the endorsers are very well looked after by the contract between the endorser and the company. But in cases where a particular endorser is engaged not directly by the company but by any advertising agency, the terms and conditions of the

contract in such cases would be different. Moreover, in some cases, there might be non- existence of any contractual relationship between endorser and company. In absence of any contract, how far a brand ambassador is liable for deficient products is a big question.

Civil Liability Regime in India: Endorsers cover up allegations of misleading promotion under their plea as mere expression of opinion and a freedom of speech guaranteed under Article 19 of the Constitution of India But that too comes certain exceptions with a reasonable restriction being imposed in the interests of general public. Health of citizens is thus, matter of paramount consideration and no person may be allowed to trade at the cost of public health.

False and misguided claims range from overrated results of fairness products (‘fair skin in four weeks’)², food supplements guarantying ‘taller stronger and sharper children, Easy Slim Tea, use of Yantras and Stone/Topaz for male child to magical cure of ailments (Dettol TVC’s super ‘protects from 100 Germs’, Patanjali’s Chawanprash’s³ claim on ‘51 herbs’) and many more making advertisements void of any rational logic or ethics.

a) Tortuous Liability

Under the Law of Torts, duty of care and negligence could be clubbed against the endorser with a burden of proof on consumer to prove ‘malice’ on the part of endorser which is difficult to prove. Moreover, the endorsers in a manner are acting as agents of the company and thus invite no liability under the tort law.

b) The Sales of Goods Act, 1930

Implied condition of merchantability befitting the description and ‘conditions and warranties’ clause under the law is a major safeguard for consumers’ interests. Also, occasionally making buyer rely on the skills and judgment of seller and informing seller of his ‘particular purpose’ makes the seller contractually responsible.

c) Consumer Protection Act, 1986

Of all the legislations dealing with misleading advertisements and liability parameters of endorsers, the Consumer Protection Act, 1986 evolves to be most efficacious whose sole purpose is to safeguard consumers’ interests and settlement of disputes. Under section 2(1)(r) the ‘Unfair Trade Practices’ include the misleading advertisements which falsely represent

that goods are of particular standard, quality or grade along with the representation that certain goods have performance, characteristics uses or benefits which such goods actually don't have.

The Consumer Protection Councils under the Act, thus, play a vital role in deciding the extent of liability of the celebrities in case of misleading advertisements but only if the role of celebs in endorsing the products of certain brands and attracting liability in case of misleading advertisements specifically provided in the Act as the existing Act does not provide clear guidelines around rights and liabilities of celeb-endorsers. Considering the impact of celebrity endorsement on the consumer choices and behaviour, situation is more damaging in case of misleading advertisements of various products and unrealistic claims. Also the intent behind the advertisements and promotional activities is not only in a view to put forth an artistic expression but to have a better impact of their product in a very short span of time so that a whole new bunch of consumers just extend their wish to buy it because a particular celebrity uses the same.

Keeping in view the current scenario of celeb endorsement and celeb behaviour, the Consumer Protection Bill, 2018 which was introduced in the Lok Sabha for the first time on January 5, 2018, seeks to replace the existing Consumer Protection Act of 1986 in order to address the emerging consumer vulnerabilities. Till now in India, no celebrity endorser has ever been prosecuted for a misleading and exaggerated claim in an advertisement. But once the proposed bill is passed, the responsibility of celeb endorsers to our society could be enforced by a legal backing and also the trend of celebrity endorsement will become more guarded.

Moreover, the Bill is obviously a welcome move towards taking the issue of misleading advertisement but there are certain loopholes in the said bill which has been attracting criticism over and over again since the bill was introduced in the Parliament for the first time in the year 2015.

a) The proposed Bill though seems to have attempted some modification in ensuring professional and ethical liability on the endorsers; it certainly tried to limit the consumer's freedom to enforce its sanctioning rights via some compromising clauses.⁴

b) Defence of Due Diligence:⁵ On the question of liability for "false or misleading endorsement prejudicial

to the interest of any consumers", endorsers have been given an opportunity to negate malice and prove their fair intention in not knowing about the veracity of the product by pleading "due diligence" and precaution.

c) No vicarious liability too could be ensued on the endorsers.

d) Empanelled Mediator: Filing of complaint through an executive agency who is an officer belonging to the Central Consumer Protection Authority and who is being duly authorised by the Chief Commissioner is violative of a person's 'right to sue' by limiting it through an unaffected intermediary.

e) Compounding of Offence: Compounding of offence by the brand ambassador for first offence is an easy escape with the brand ambassador or endorser shelling out monetary damages at the cost of consumer's physical and mental health.

Criminal Liability Regime in India:

a) Indian Penal Code:

Any person selling or offering for sale noxious or unfit food can be prosecuted according to the provisions of the "Indian Penal Code" if that person does the same knowingly. In the case involving the instant noodle Maggie, a case under Section 270 which incriminates the malignant act that is likely to spread infection of diseases that are dangerous to the life of the persons was filed against the endorsers. Also the criminal liability cases involving Section 273 dealing with the "sale of noxious drinks", Section 276 involving the "selling of drugs as a different drug or preparation" and Section 420 involving "cheating and dishonesty" was reportedly being filed against the celebrity endorsers.

But the liability cases made under Section 420 and Section 376 dealing with cheating with regard to property and the sale of different drugs or preparations respectively are falling apart as it was not the clear case here. On the other hand, in Sections 270 and Section 273 there is a specific requirement of the involvement of the accused directly with a clear intent which is missing in some cases and difficult to prove in some other.

b) Other Special Statutes:

The Food Safety and Standards Act, 2006 under Section 24, puts a restriction on advertisements that are misleading. The Act says "no person shall be allowed

to engage in misleading representation concerning the standard ‘quality, quantity, grade and composition’, and ‘need for, or the usefulness of a food product’. Moreover, it also restricts the endorser from making such statements that gives any guarantee to the consumers as to the efficacy of the product.

The penalty for false advertisement is provided under Section 53 of the said Act which can extend up to 10 lakhs (it is believed by some legal experts that the amount of penalties in such cases are typically picked up in the contractual indemnities provided by the manufacturers or the brand owners).

Regulatory Framework in India: “Advertising Standards Council of India”, (ASCI) is a non-statutory Tribunal established in the year 1985 also deals in regulating the mechanism for ensuring just and ethical advertisement practices and takes up complaints against any perceived misrepresentation in an advertisement.⁶

It has power to give direction for modification and withdrawal of any advertisements hereby assuring truthful representations of the product. ASCI works on its code of Advertising Practice and is applicable to advertisements read heard or viewed in India irrespective of their origin. According to Gowree Gokhale, a senior partner of an International Law Firm Nishith Desai Associates, basing on the principles of “decency, fairness, honesty and responsibility”⁷ the advertisements are evaluated by the ASCI. Although the orders of the ASCI’s are generally void of enforceability, the Ministry of Indo and Broadcasting has made the violation of “Advertising Code” a penalty restricting the Cable service providers and TV channels to promote.

International Norms: In the United States, the Federal Trade Commission has certain guidelines for endorsement by celebrities. The FTC made amendments in the year 2009 giving the consumers the liberty to even hold celebrities liable in cases of misleading advertisements. It has prescribed standards for the liability of endorsers. Advertisement are evaluated on the principle of “*good reason to believe that*” in order to examine whereas the endorser has sufficient reasons to believe that the said feature of a particular commodity he is endorsing and thus guidelines make the celebrities responsible enough to investigate products first and also requiring celebrity to be a *bona fide* user.⁸

In Europe, there is voluntary self-imposed code to be followed by the celebrities whereby they are refrained

from endorsing “medicines, medical treatments, tobacco and alcohol” which have harmful effect over the health of the people.

In China, there is equal and joint responsibility with food producers if food causes harm with an option to file claim either against enterprise manufacturer or celebrity recommending the same. Misleading testimonials too have same fate. The Food Safety law of China talks about endorsers’ liability in case of misleading testimonials and recommendations. In an endorsement of a shampoo, Jackie Chan faced a legal battle for the shampoo brand he was endorsing which was alleged to be containing cancer causing ingredients whereas the advertisement showed it chemical free. But the suit against the endorser failed on the ground of non-existence of any legal relationship between the endorser and the company. China does not have any procedure for determining liability of the celeb endorsers such as “false and misleading test” and is yet to evolve laws regarding celebrities by fixing joint responsibilities in all spheres of trade.⁹

Korea, on the other hand, has a “self- regulatory institution” responsible for issuing guidelines with respect to endorsements which also has the power to decide which products are to be expressly advertised and which are not, thereby making false advertisements a rarity. It can thus, be said that Korea has comparatively more stringent mechanism in controlling misleading advertisements.

Conclusion

In lights of the expanding economic horizons of the country, it is the need of the hour to establish an economy where none is taking advantage of and none is left bereft of resources. Endorsers certainly are creating target base and building markets for big multinational companies through their perceived influence on consumers’ mind, interpreting ‘innocent misrepresentation’ and ‘negligent misrepresentation’ would be a guidance for lawmaker to see through a better and sound enforceability and plea of privity of contract or defences against strict liability falling short of their rationality when endorsements involve recklessness and whimsical professional ethics. Before acting as a spokesperson to the brand’s voice or being a mere carrier of information there is certainly a ‘line of commitment’ to morality and ethics. Thus, while it is time to ensure strict regulations against people who sacrifice their integrity for money, celeb-endorsers and advertisers take joint responsibility to marketing and

promoting ‘truth’ and ‘veracity’ in products and services.

Crossword Puzzle: An Innovative Assessment Tool to Improve Learning of Students in Forensic Medicine

Harish Kumar Agarwal¹, Aparna Singhal², Arvind Kumar Yadav³

¹Assistant Professor, Department of Forensic Medicine, ²Assistant Professor, Department of Ophthalmology, Maharaja Agrasen Medical College, Agroha Hisar, Haryana, ³Professor, Department of Pharmacology, Geetanjali Medical College and Hospital, Udaipur, Rajasthan

Abstract

Background: As per Medical Council of India (MCI) for setting teaching learning standards according to need of society, now has focus shift from traditional teaching methods to adopting teaching learning method that is been termed as competency-based learning. Faculty training programme by MCI are also providing the right platform for learning the new methodology in medical education.

Objectives: To prepare an interesting and effective tool in assessing the knowledge of Forensic medicine among the medical undergraduate students to produce competent and confident Indian Medical Undergraduates.

Methodology: Crossword puzzle exercise was given to 2nd year students, who were in 5th semester. 38 students participated in this study. A questionnaire was given to the participants to evaluate the response consisting of 15 questions; responses were obtained on Likert scale 5 to 0.

Results: Out of 38 students 92% of students found the puzzle interesting. 76.4% students found this puzzle as a useful tool to learn forensic medicine. 73% students agreed it to be a useful tool for the assessment of their knowledge. 81% students were in favour to use such puzzle in competitive exams. In terms of retaining the knowledge of topics, 84 % students found this puzzle useful.

Conclusion: Crossword puzzle improves memory power, performance and critical thinking of students with fun. This can be tried as a question in periodic internal examination for internal assessment as well as well as for the purpose of structured viva examination in university examination.

Key words: MCI, traditional teaching, medical undergraduate, cross word, assessment

Introduction

Teaching and learning are mutual procedures that influence each other, and assessment determines both students and teacher's effort¹. The purpose of assessment is to impart quality education to students, to give feedback to the educational managers about the curriculum, and to categories the students according to their talent and to monitor their own learning. Assessment also provides

a high degree of fairness and objectivity in testing and produces data to enable continuous quality improvement². The welfare and indeed the future health of people depend on the quality of medical graduates which in turn depends on quality of medical education. Educationists believe that simply by changing the assessment style for the learners can affect the way students engage with the subject contents³. Assessment drives learning and learning drives practices. By changing the format of assessment or examination, can lead the students to engage their study more thoughtfully; their focus can be shifted to clinical rather than theoretical issues⁴.

The crossword puzzle is a century old game and was first used in ancient Egypt. In 1913, Kathryne

created a modern crossword puzzle⁵. In recent years, it has become an interesting game and we come across it in many newspapers, magazines, books, and journals. Some magazines even offer prizes for solving it as an incentive for the participants. Recently educationists have started using these puzzles as an educational tool especially in medical education and nursing courses.⁶⁻¹² Crossword puzzle can also be used as an innovative tool for assessment of undergraduate medical students.

This exercise helps them to remember the forensic medicine terms easily, understand the concept and helps the teachers to evaluate the students' knowledge and understanding. It can detect the misconceptions and help to clarify the concepts of the medical student.^{13,14} The benefits of such active learning are that it promotes the communication ability, memory, cooperation among learners and their critical thinking power.¹⁵

Such games are important in acquiring skill and psychomotor knowledge, brain functions like understanding, thinking, remembering and analyzing the facts.^{16,17} The crossword puzzles are in various forms including cryptic form, symmetrical form.

Since medical education has changed dramatically in last few decades, the assessment of knowledge of medical students also needs to be changed and it needs to be effective as well as interesting. Crossword puzzle will prove as an effective tool for assessment in terms of recall and analysis of knowledge. Forensic medicine is a very important subject for the medical student for their career, and for the medico-legal system to have more experts. The crossword short answer question (SAQ) stimulates the cognitive function. Due to previous experience in crossword puzzles¹¹, the author got an idea to use his puzzle in the examination as short question answer.

The literature search did not show any crossword puzzle tool in form of short question-answer assessing the knowledge of the forensic medicine in medical students. This is an innovative tool for the above purpose and hence this study was planned. We tried to evaluate the crossword puzzle tool for assessment of their knowledge and also analyzed their feedback for the crossword exercise given to them.

Materials & Method

The present study was a prospective cross-sectional analysis of feedback questionnaire. This study was

carried out in the Department of Forensic Medicine, MAMC Agroha after approval from institutional ethics committee. The crossword puzzle exercise was formulated with the terms and words from taught syllabus of Forensic Medicine was formed. This puzzle had varying degrees of difficulty which were evenly distributed; key related to each question was prepared, including facts, hints or statement related to the question. This puzzle was distributed to faculty of forensic medicine for validation. Suitable changes after validation were incorporated. A feedback questionnaire was prepared by the authors consisting of 15 questions evaluating student's perception on the given crossword puzzle, its impact on retaining and recalling the knowledge and further utilization of such puzzle in different disciplines of Under graduate curriculum. The questionnaire was also given to senior faculty of the various streams of medical undergraduate subjects for validation. The validated feedback questionnaire was used for responses. All the feedback responses were graded on Likert scale from 5 to 0 in which grade 5 was awarded to those who strongly agreed, 4 to those who agreed, 3 to those who moderately agreed, 2 to those who least agreed, 1 to those who strongly disagreed and those who did not respond were given grade 0. A total of 38 students of 5th semester participated voluntarily after briefing them about the method and purpose of this crossword puzzle and feedback questionnaire. Each question was awarded score 1 (for correct) or 0 (for incorrect), with no negative marking. All the participants were given a crossword puzzle sheet, a paper for keys, and a questionnaire. Participants were instructed not to use internet, mobile or any books. They were allotted 45 minutes to solve the puzzle. The puzzle had 9 horizontal and 8 vertical words to fill with the help of 17 key statements (Figure 1 and Figure 2). After completion of 45 minutes, a questionnaire for feedback was given to the participants and 15 minutes to read the questions carefully and to answer. The crossword entries were checked and each participant was marked out of 17. Marks scored by students and response to feedback were analyzed with suitable analytic tests.

Results

Out of total 38 students; 11 students secured 16-17 marks, 17 students obtained marks between 13-15 and 5 students obtained 10-13 marks. Of the total, 47.23% did not agree that it was a wastage of time. 81.6% students felt this method less time consuming as compare to traditional examination methods. 65.8% students also

agreed to take part in preparing cross word puzzles by their own. Other responses of the feedback are depicted in figures 1 to 3.

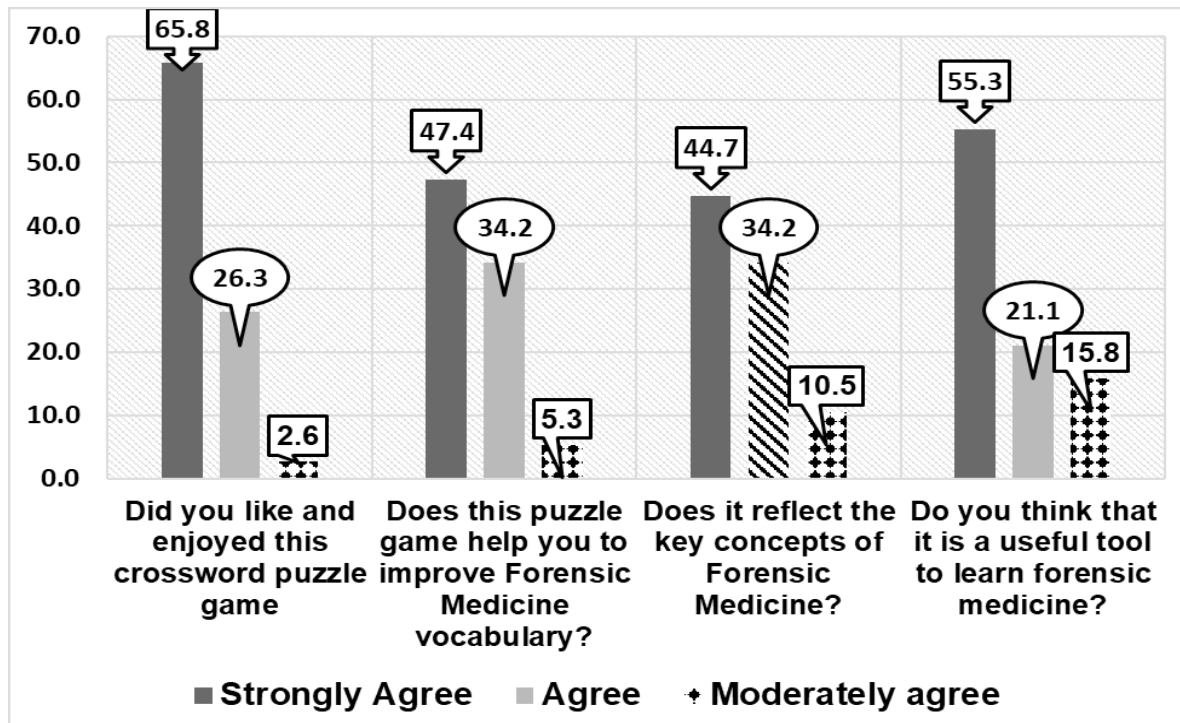

Figure 1: Students perception on cross word puzzle in Forensic Medicine

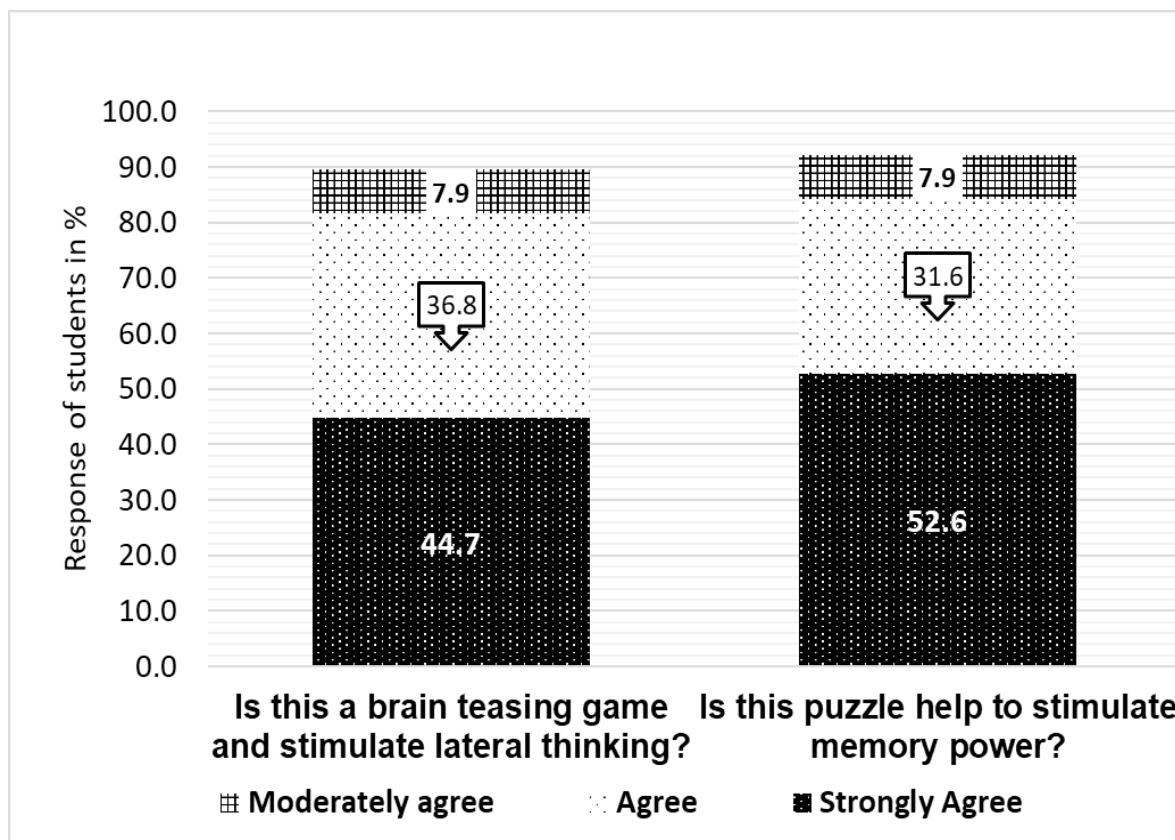

Figure 2: Students' perception on recalling the information by cross word puzzle

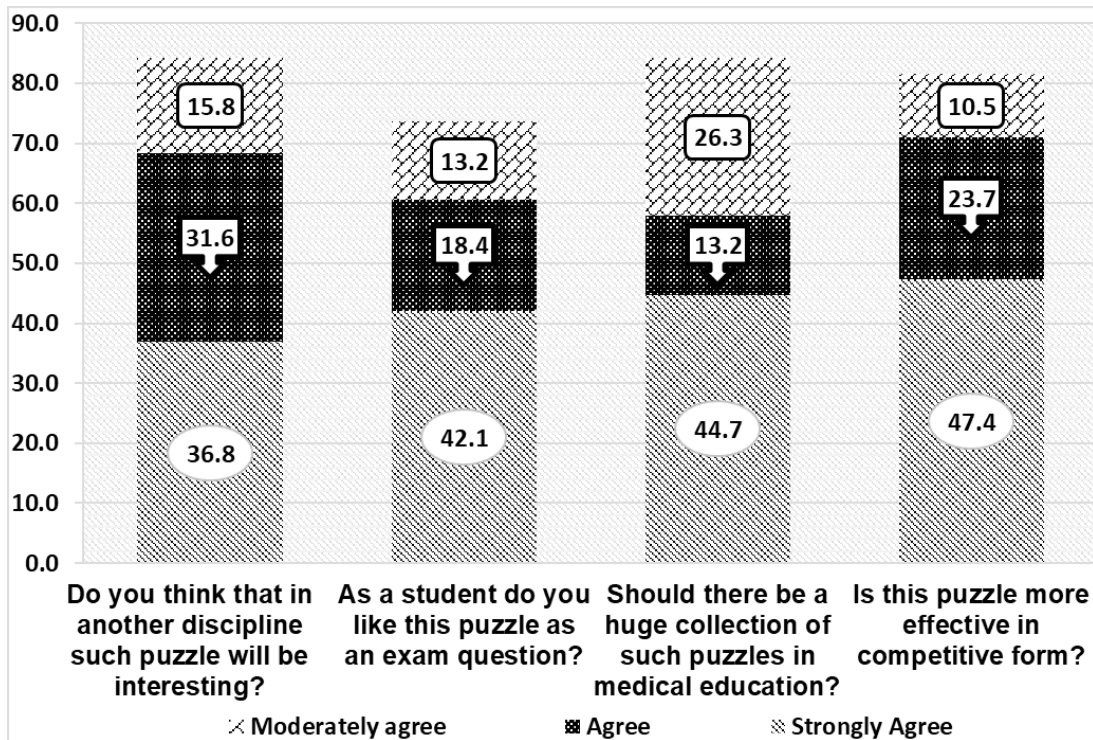

Figure 3: Students’ feedback on implementing such crossword puzzle in other disciplines

Discussion

The crossword puzzle is a very interesting word game and many people enjoy this game. Crossword puzzle as a teaching tool is very beneficial in remembering the words and terms with the help of keys. The key consists of facts, hints or statements in the form of a word, facts, terms or incidences and when a student reads the key, he recalls the answers easily. As we know that memorizing any fact needs its correlation and memorization of other related facts¹². Once he remembers the related words, he has to fit the answer in the crossword by counting the number of alphabets mentioned in the key. This is how it stimulates thinking and improves the memory. This same mechanism of recalling is useful in an examination which will automatically improve the performance in an examination too¹³.

We did this survey to study the individual performance of an undergraduate medical student without any help or without the cooperation of groups. So, it becomes easy to know the performance of a single student, because in a group usually, one or two students are active, and others are passive and so the assessment is not for all¹³.

Bailey et al used four types of games like crossword puzzles, words scramble, word search and hidden

message puzzles, in gastrointestinal physiology teaching. According to them, in the crossword puzzle, inability to identify the word indicates the weakness and that can be corrected by proper teaching.¹⁰

Htwe et al did the study on crossword as a teaching tool on the group of students and revealed that is an excellent tool for teaching pathology with fun.¹¹ Saxena et al. also did the same study on groups of students and they concluded that students liked the crossword puzzle as a teaching tool.¹²

We believe that for teaching and learning purpose this survey can be used on a group of students, but for the assessment of the students, the student must solve the crossword puzzle individually. In our study, the main aim was to study the crossword puzzle as a tool to assess the students in an examination, so we did not make the groups of students. Playing with such puzzles, psychomotor skill and knowledge both are increased.¹² We did this study for the subject of forensic medicine which is a brain teasing discipline where the student must churn the thought process for the complicated case scenario with various medico-legal aspects, like a detective. Nowadays many of the medical schools and colleges emphasize on student oriented medical education where the active involvement and participation of every

student is necessary, especially in small group teaching, for better and detailed understanding of concepts in medical science. The students are encouraged to solve the problems by themselves.^{18,19}

Crossword puzzle improves cognitive function as per clinical trial done by Wolinsky et al.²⁰ They used computerized crossword puzzle in a clinical trial on middle aged and old people to study the cognitive processing speed and concluded that crossword puzzle delays the decline in the cognitive process and improves the speed of the cognition.

Conclusions

Majority of participants liked the crossword puzzle as an examination question. It improves memory power, performance and critical thinking of students with fun. This can be tried as an examination question in periodic internal examination for internal assessment and can be used for the purpose of structured viva examination in university examination in other disciplines of medical undergraduate curriculum paving the way for creating more competent medical graduates, the need of the society at present time.

A Study to Assess the Patients Compliance to Medications among Hypertension Patients at Selected Areas in Kanchipuram District Tamilnadu

M.Kalki¹, S. Mohana Priya¹, N.Thivya²

¹B.Sc. (Nursing) IIIrd Year Students, ²Assistant Professor, Chettinad College of Nursing, Chettinad Academy of Research and Education, Kelambakkam, Kanchipuram dist. Tamilnadu

Abstract

Hypertension is the most prevalent cause for cardio vascular disease, affecting at least 600 million people worldwide and is an important contribute to cardiovascular mortality and mortality. Compliance to antihypertensive medication has been found to be a major concern³

The study was conducted to assess the patient's compliance to medications among hypertension patients at selected areas in Kanchipuram district Tamilnadu. The objectives of the study were to assess the patient's compliance to medications among hypertensive patients and to associate patient's compliance to medications with selected demographic variables.

The research design selected for the study were Descriptive research design. The sampling technique used for the study were purposive sampling with the sample size of 60. Data collection was done by identifying the demographic variables and by using Morisky Medication Adherence scale, the patient's compliance to hypertension medications was assessed.

The results revealed that assessing patients compliance to medications, the study shows that 48(80%) of hypertensive patients are following medium compliance of hypertension medication and 12(20%), of the patients are having low compliance and none of the patients 0% are following high compliance to medication. Regarding association with demographic variables, factors like sex and blood pressure are highly associated with compliance to medications and there is no significant association with the demographic variables like age, educational status, types of family, religion, socio economic status

Hence community education is needed to improve the patient's ability to cope up of medications and make informed decision regarding hypertensive medications and to motive the community people to introduce changes in diet and life style modification.

Keywords: Patients, Hypertension, Medications, Compliance

Introduction

Hypertension is the most common cardiovascular disease, emerging as a major public health problem in

developing as well as developed countries. The WHO report that the prevalence of any disease, hypertension ranks four in the world. Pooled epidemiological studies show the average prevalence of hypertension in India is 25 % in urban and 10 % in rural population. Hypertension is a significant public health problem in urban and rural areas of India. It is directly responsible for 57 % of all stroke deaths and 42% of coronary heart disease deaths in India. It is also leading cause of blindness, renal failure and congestive heart failure³

Successful control of blood pressure is of para amount importance in the reduction of morbidity and

mortality rates and many studies have demonstrated the impact of antihypertensive agents on improving clinical outcomes. However, the achieved by optimal compliance to prescribed medications according to healthcare provider's instructions⁴

In developing countries, the degree of non-compliance is assumed to be higher particularly due to shortage of health resource and difficulties in access to health care professional is necessary. patient's education is a process that improves patient's ability to cope up and make informed decision regarding their disease medication and motivate the patients to introduce changes in diet and lifestyle modifications.⁶

Materials & Method

The methodology of research indicates the general patterns of organizing the procedure for getting valid and reliable data for investigation. Research approach for the present study was a descriptive research approach. The descriptive research design seems to be the most appropriate design for this study. The study was conducted in the selected area in Pooncheri villages, Kanchipuram district, Tamilnadu. All the hypertensive patient residing in the selected villages and who fulfilled the sampling criteria was included in the study.

Sampling Criteria

Inclusion Criteria

- Patients who are diagnosed as Hypertension
- Hypertensive patients who are under single hypertensive drug

Exclusion Criteria

- Hypertensive patients who are having other chronic diseases.
- Hypertensive patients who cannot speak and understand Tamil/English

By using purposive sampling technique 60 samples were selected. The tool used for the study consists of the demographic variables like age, sex, educational status, types of family, religion and socio economic status and blood pressure. To assess the Compliance to medications, Morisky Medication Adherence scale was used.

Study Findings:- Regarding demographic variables

- Maximum no of hypertensive patients were in the age group of 51 years and above 41 (68%)
- Maximum female 32 (53%) are hypertensive patients
- Majority of educational status was Non formal education 24 (40%)
- Majority of family of hypertensive patients are single family 40 (66.66%)
- Majority of religion of hypertensive patients are Hindu 41 (68.33%)
- Majority of taking hypertensive medications regularly 42 (70%)

- Majority of person from which a they are getting medication for hypertension are 38 (63.33%)

- Majority of blood pressure are 46 (76.66%)

- Regarding assessing patients compliance to medications, the study shows that 48(80%) of hypertensive patients are following medium compliance of hypertension medication and 12(20%), of the patients are having low compliance and none of the patients 0% are following high compliance to medication. Regarding association with demographic variables, factors like sex and blood pressure are highly associated with compliance to medications and there is no significant association with the demographic variables like age, educational status, types of family, religion, socio economic status.

Discussion

Hypertension is the most prevalent cause for cardio vascular disease, affecting at least 600 million people worldwide and is an important contribute to cardiovascular mortality and mortality. Compliance to antihypertensive medication has been found to be a major concern.

The mean proportion of control hypertension among all hypertension patients being only 13% because of poor medication compliance and is one of the leading causes of failure to achieve blood pressure control.

Conclusion

The study reveals that health care facilities should concentrate on continuous treatment for non communicable diseases, health education to the public

on regular medications can able to prevent complications from cardiovascular diseases and other complications.``

Efforts to be made enhance the capabilities of doctors, village health nurses and other paramedical through pre-services and in-service training programme to enhance not only prescribing medications and follow up of medications is essential.

Restrictions Imposed by Human Biology in Achievement of Gender Justice as Human Rights

Parul Yadav¹, Komal Vig²

²Associate Professor, Amity Law School, Amity University, Noida)

Abstract

In contemporary times with frequency as high as that of everyday, we are witnessing debates on implementation of gender justice. Be it college forums, news channels or for that matter parliament everywhere and everyone at both conscious and sub-conscious levels are aware of the problems resulting because of imbalance in power equations between the genders. The focus area of this research paper will be India and legislation of India which has made many laws, bye-laws and rules to bring feminine and masculine gender on the same footing but yet there are gaps through which gender justice is getting hit hard despite the Criminal Amendment Act of 2013 and 2018. Complication by the NALSA judgment have occurred as a result of which the definition of gender justice needs over-hauling but the Indian society is unwilling for it. Through this research paper, researchers trace out the problem is actually lying in the very meaning of sex, sexuality and gender as understood by the society of India and the solution is lying in being neutral towards sex and gender.

Keywords: - Sex, Gender, Sexuality, Gender Justice

Introduction

From the history of human to present, there are ample evidences which are leaving no doubt on the fact that there is some sort of interconnection between working of the human society irrespective of the fact that in which ethnicity and time zone that society is working in. There are certain rules of a society of course unwritten in majority of the human civilizations which are based on the sex of a person. For example, as to how the property is to be distributed, which jobs particular sex and gender can do or cannot do, even the “public places” like parks, circus, theaters, malls etc.. are being restricted by sex and gender of a person.

Nomenclature of Sex And Gender

This research paper is focusing on the how the

concept of gender justice has been developed over a period of time. Before that there are certain concepts which shall be understood before focusing on the research problem of this research paper. And they are:-

a) Sex

As known commonly, it is a natural phenomenon which distinguishes between body of man and woman. It is also known as sexual activity which results in progeny. Medilexicon¹⁰ defines Sex as a character biological in nature based on their gonads, chromosomes, hormones, primary and secondary characteristics and identifies human bodies as male and female. Sex is also a psychological progression of a person which triggers the behaviour automatically for the purpose of sexual contentment. Wharton¹¹ in her work defines sex as a characteristic which is biological relying on hormones, chromosomes, gonads etc..and if clearly distinguished then are termed as normal sex being male and female and if parameters are in divergence, the human body is labeled as Intersex.

M:-9599105103

b) Gender

Gender is a role which males and females are expected to play in society for ensuring its smooth functioning. Tierney¹² defines Gender as social and civilizing expression which dictates the manner in which defined biological body is suppose to function.

Role of Sex and Gender

As the Indian society began to take shape, individualism vanished and a pattern developed wherein food production became the responsibility of the males, considering their physical potency while distribution went to females because of their biological capacity of giving birth, making womb, a resource to cash as the principle was to survive. These clashes for survival, highlighted the need of human biology where male sex attained preferences in working of the societies and accordingly roles named as gender were formulated for the sake of convenience. It was this convenience, roles in the form of gender began to define and since it meant survival, male and female began to enforce them on the younger generations and inculcated divine , morality and law to aid the compliance of these roles and penalized all acts of deviance.

As a matter of fact, in India the presence of third sex is known by its gender role which is to provide amusement and is labeled as Kinnars, Eunuchs, Hijras, Khwaja-sarah nd recently as Intersex, transgenders etc. They were in haraams of the kings and queens, in circus etc..but were in no way daughter-in-laws or sons-in-law of a “normal” family.

Effect of Gender on Sexuality

Sexual behaviour which aided in continuance was accepted as normal known as Heterosexual activity with a rider of reproduction classifying it to be moral sexuality. This termed penile-vaginal intercourse as normal and moral while rest any other sexual activity as immoral even between a heterosexual couple because that was not resulting in progeny.

Because of this moral weightage, sexuality began to give in and same sex relation modernly known as homosexuality were frowned upon and became sin. To ensure that homosexuality and all other non-productive heterosexual activities are discouraged, legal structure was roped in and sanctions as hard as burning alive, amputation , hanging , jail sentences and not to forget

fine and social detestation, were introduced to make sure that gender is abided within the four squares as laid down.

However, this control of gender on sexuality backfired and visible victims of this control were females who were then laiden with the expectation to remain chaste till their official union with a ‘man’ in form of marriage and procreate as many times possible. It denied them the access to medical sector without getting their gender role scrutinized first at the help-desk and then at doctor’s chamber. The other casualty were biological males who were sexually attracted towards males. Known as homosexuality, this behaviour was morally and legally penalized.

Last casualty of gender roles are Third sex/ Intersex, whose sexuality itself has no where been defined. The denial is so strong that no proper scientific research have been conducted to understand the sexuality of Intersex. Even the medical fraternity which is of course the members of normal society have concluded their many research attempts by stating that they are abnormal and in need of medical aid in terms of psychological corrections, hormonal and surgery procedures. The ambiguous genitalia is a medical emergency and sex reassignment is prescribed after consulting with parents of the child with the personal opinion of the doctor. Here most of the times the child is too young to understand the complexities of the procedure yet, a “normal” biological sex is assigned to the child with enforcement of parallel gender role. But what is forgotten that what is allotted will be in arms with what is felt internally. The end result is of a contradiction and conflict of soul and when the child defies the allotment the labels, who is then a transgender¹³.

Presence of Third Sex and Gender

It will not be incorrect to say that presence of third sex and gender openly have been felt in the society from last 40-50 years only before that they were open secret of human society which were denied any sort of identity / labeling by the normal society to maintain its self-proclaimed integrity. They have been awarded names from kinnars to hijras , Khawaja-sarachs to kathoeyes , sissys to muxes and have faced discrimination along with both physical and sexual violence.

It is only recently that the third sex and gender have been identified as Human and their rights have been advocated through various international conventions.

For instance, united nation resolution on human rights, sexual orientation and gender identity 2012¹⁴, wherein it was sketched that it is the State which is to protect the individuals irrespective of their LGBTQI sexual orientation and any violation will be treated as violation of Universal Declaration of Human Rights. Then there is international policy of United nations on Men having sex with Men 2006¹⁵, where in states are directed to take all the measures on the fact that homosexual men are not discriminated on basis of their sexuality and proper medical treatment is provided to them as needed. It has been further said that there shall be awareness programmes in local neighbourhood to make society aware that homosexuals shall not be discriminated just because of their sexuality. There is declaration of commitment on HIV/AIDS¹⁶ wherein it was for first time in the recorded history of international legal documents, stated that the transgender person are in need of State protection and medical aid as they are the ones who are being discriminated solely on the basis of their sexuality.

India also know acknowledges, the presence of the third sex and gender via NALSA¹⁷ judgment wherein an umbrella term “Transgender” was chosen to identify distinct sexuality of LGBTQIA. It was in NAZ judgment¹⁸ wherein Section 377 of IPC,1860 was declared as unconstitutional by Delhi High Court, but only till the consensual part. This was overturned in Suresh Kumar¹⁹ wherein the court opined, that it is the legislative decision and courts shall not interfere as they only interpret law. In 2018 came Navtej Singh Johar²⁰ wherein again Section 377 of IPC,1860 was declared unconstitutional till the consensual part giving a choice to make to members of LGBTQIA community.

The reason of such fluctuations in dictates of judiciary pertaining to the issues of LGBTQIA community is the fact that there are moral dilemmas of the society and judges are part of the society, so it is very normal that such dilemmas step in law making process. This conflict between legality and morality was first time recorded in Hart-Devlin debate wherein Wolfeden Committee in England clearly stated that legal dicta has nothing to do with same sex behaviour and hence the Buggery Act got evaporated from the legal text of Britain. This small statement caused uproar in British Society because it was disturbing the way a society works. This lead to debate²¹ between two wise heads namely HLA Hart and Lord Devlin where later opined that segregation of morality from legality will lead to confusion in for a person as there will be no internal, moral force which will make

him/ her to oblige with law. HLA Hart, who rejected the arguments made by the former and stated that Devlin is going by the principle of majority rules but the minority no matter how small cannot be overlooked and cannot be imposed on everyone.

In India, it was in 2018 only when the consensual homosexuality was acknowledged. Ideally, it is a great step taken by the judiciary in bestowing Article 21 and 19 on LGBTQIA community and gave them liberty of life and choice but the confusion on sex and sexuality can be seen in the dictum of apex court as well. The celebrated NALSA judgment which recognizes all non-heterosexual activities under the term of transgender and identifies kinnars, hijras etc.. as third gender, while in the interviews conducted by the researcher proves the fact that the judgment has failed them. They opine that their attempt was to identify themselves as women but labeling them as transgender have defeated their struggles. They are still outside the purview of society and hence justice is still a distant dream for them.

Gender Justice

Oxfam²² defines gender justice as a human right for women in order to grant life full of liberty, dignity and freedom to make choice. While generally, gender justice is taken as something which aims to bring equality between man and woman. Point to note here is that the concept of gender justice in itself is talking about two known biological sexes and genders only. It is correct that gender justice is talking about equality, justice, liberty etc.. all fantasized concepts to restore dignity of human life but they are all incomplete attempts as not all lives are taken into consideration. This results in biasness where the base of discrimination is lying in human genitals as a result of which implementation of gender justice around the world has failed miserably and no concrete results are yet been achieved even in India. For instance, legislation in an attempt to do gender justice formulated Article 14, 15 and 16 of constitution to open up work, education opportunities and public place for Indian women but the glaring question is are they still open?. In a recent survey²³, it was conveyed that more number of educated women are dragging themselves out of work force, to be home-makers as there is no one to look after young ones. So, what sort of gender justice are we as a society advocating?. Answer to this situation is lying in gender neutrality, which is relatively new concept but rather simple to understand and it means applying all the principles of justice and

equality without giving any preference to sex and gender of person.

Cambridge²⁴ dictionary defines gender neutrality as something which has nothing to do with men and women in particular. The definition in itself is confusing and hilarious, as it does not explain what it actually means. European Institute of Gender Equality²⁵ defines it as, policies which are not in particular effecting men or women. However it does not stop here and says further that these policies effect male and female sex uniformly. This definition on international forum clearly demonstrates the importance of normal sexes in the society and the confusion or rather unwillingness to give acceptance to third sex and gender as a human body.

Even the concept of justice, in form of gender justice is under challenge. However before that we need to have a basic understanding of what is gender justice? United Nations defines it as a concept wherein an end is brought to the inequality among biological males and females be it in home, office or societal norms itself.

Here the problem is that years of usage feminine gender is allotted the role of victim and it is the male biology who is a offender. In India, the legal acceptance of homosexuality and all other non-heterosexuality has highlighted the fact that even the biological male can be victim of gender discrimination and the biological female a hardened offender. Now this very notion has jolted the concept of gender, which is finding difficult to accept that masculinity can be a victim and femininity an offender. "Normal/ mainstream" Society is still finding it difficult to accept that in heterosexuality which is still the normal and moral conduct for the society, a man can be victim and a women an offender, as it questions the very role the society had created for them.

Elevation to Gender Neutrality

The question which arises before us is now that what can be done to solve the confusion which the pre-conceived notions of sex, gender, gender justice have on the society. And the answer to this problem is lying in extension of gender justice and moving towards the understanding and accepting of "Gender Neutrality" which means being neutral to one's gender without giving any preference to biological and sociological sex.

This concept is focusing on bringing formal equality wherein the concept will be applied as whole and focus will be on human body and its rights rather than on his

or her rights where substantive equality executes itself. This execution of substantive equality is so unaware of the concept of intersex and LGBTQIA that there are no roles defined for them in the society. Let alone be the roles, no name are also allotted for intersex and transgenders unlike the designations of Mr., Mrs., Miss, His or Her, He or She for 'normal' male and female sexes. The names if any available to intersex and transgenders are like abnormal, kinaar, hijras, she-male, he-female and all sorts of slangs and derogatory words which are being used to taunt rather than name them.

Conclusion

To brief up this piece, it seems that this newly found species / variation of human body in India has shook up the strings of society on the basis of which its execution has been drafted. Until now the very concept of human rights to accomplish itself was literally looking below the belt of a human body and if it was able to trace the distinguish genitalia of a male and a female only then that body classified itself to be a human and having any human rights. Even the black and white text of Indian laws including the constitution of India which sculpts the principle of equality from Article 14 to 16 but give it a shape of male and female only. The very concept of human also known as person in law in itself needs a change. Both law and society has to understand the genitalia, testosterone, estrogen and heterosexuality are not the only criteria to identify someone as humanoids. There are feelings of love and respect in the heart, value of life honour and dignity and that certainly cannot be based on sex and sexuality of a person.

Knowledge & Perception of Medical Students Towards The LGBT (Lesbian, Gay, Bisexual & Transgender) Patients & Their Rights: A Cross Sectional Study

Ninad Nagrale¹, Pawan Wankhade², Bhupendra Gathe³, A.P.Dongre²

¹Associate Professor, Forensic Medicine & Toxicology, Shri Shankaracharya Institute of Medical Sciences, Bhilai, Durg (CG), ²Prof & Head, Department Forensic Medicine & Toxicology, Chandulal Chandrakar Memorial Medical College, Kachandur, Durg (CG), ³Associate Professor, Physiology, Shri Shankaracharya Institute of Medical Sciences, Bhilai, Durg (CG)

Abstract

Diversity is a part of our everyday lives. Having good attitudes towards LGBT (lesbian, gay, bisexual & transgender) individuals is one of the ways of accepting and respecting human diversity. In this way, the quality of offered services will be same for all the people. Attitudes of medical professionals towards homosexuals can influence their willingness to provide these individuals with medical help. The study evaluates the medical students' knowledge about homosexuality and their attitudes towards it. The sample consisted of 200 participants (104 from second year & 96 from first year) who anonymously completed the preformed questionnaire. The study showed that the second year students have more knowledge than the first year students. Degree of knowledge had significant predictive effect on attitudes in the analyzed predictive model & is important tool in shaping the attitudes towards LGBT patients and reducing stigmatization.

Keywords: Lesbians, Gays, Bisexuals, Transgenders, attitude.

Introduction

A person's sexual orientation affects the attitudes of others toward him or her. In today's world, heterosexuality is the norm and most minority groups like LGBT people are subjected to stereotypes. Their population ranges from 4 to 17%¹. Homosexuality is thought to be "against the nature" by most of the religions in the world & has been a debatable issue since the ancient time. Perceptions toward LGBT people are various according to types of societies, cultural and moral development or political situation. According to Harry (1989)², homosexuality is not rare or unusual for people who have that kind of sexual orientation, but they often face the prejudice from multiple sources such as at home, school and work. Weinberg (1972)³

gives the first definition of homophobia that indicated it as irrational negative attitude towards people with homosexual orientation. Studies use different terms to indicate hostility, antipathy or discriminatory behaviour directed towards LGBT people. Homonegativity includes negative attitudes, values and beliefs of the heterosexual majority towards same-sex couples, along with the negative reactions towards them⁴. These negative feelings have been investigated more deeply & distinguished into variety of terms such as biphobia, transphobia etc⁵ each one depicting differences and the special problems that follow. Perception and knowledge towards LGBT patients in health care is an important but infrequently assessed issue in India. So an effort is made with our study to know the same in medical students at a medical college.

E-mail: drpawan9781@gmail.com

Aim: To know the knowledge & perception of medical students towards the LGBT patients.

Objectives: To assess:

1. Awareness of medical students regarding LGBT people & discrimination faced by them.

2. Acceptance Level of medical students regarding LGBT people & ways to address the problem of discrimination.

3. Awareness of medical students regarding recent Supreme Court judgment regarding S. 377 IPC & its social impact.

4. Attitudes of medical students towards LGBT people.

Materials & Method

Participants: The study includes 200 randomly selected medical undergraduate students with gender distribution of 61.5% (N=123) females and 38.5% (N=77) males. 96 (48%) of the participants were from first year and 104 (52%) were from second year. The participants' ages ranged from 19 to 23 years. Majority of the participants (89.5%) were from urban setup.

Design and settings: Between April & June 2018, 200 medical undergraduates attending their first & second year were asked to participate in the survey to assess their knowledge, attitudes & perception pertaining to LGBT people & their healthcare.

Ethical issues: Permission from Institutional ethical committee was taken. All participants received verbal and written information on the study. Their participation was anonymous and voluntary, and their responses were confidential.

Data collection: We collected data from the students by using preformed anonymous questionnaire having six sections. It was designed by the authors to obtain information that was supposed to have effects on the scores of Knowledge, Attitudes and Perception towards LGBT patients in clinical practice. The survey took place in a large classroom with enough space per student to allow for privacy and it took approximately 30 minutes to complete in presence of authors.

Results

Table 1: Demographics of the Respondent:

Demographic parameter	First year	Second year	Total
Gender			
Male	42	35	77 (38.5%)

Rural	6	15	21 (10.5%)
Urban	90	89	179 (89.5%)

The study includes 200 randomly selected medical undergraduate students with the gender distribution of 61.5% (N=123) females and 38.5% (N=77) males. 96 (48%) of the participants were from first year and 104 (52%) were from second year. The participants' ages

ranged from 19 to 23 years with majority (33.5%) are of 20 years of age. Majority of the participants (89.5%) were from urban setup.

Table 2: Awareness:

Awareness parameter	First year		Second year		Total (200)
	Yes	No	Yes	No	
Are you aware of the acronym LGBT & LGBT movement?	96	0	104	0	100%
Knowledge & understanding regarding following terms:					
Lesbian	96	0	104	0	100%
Gay	96	0	104	0	100%
Bisexual	96	0	104	0	100%
Transgender	70 (35%)	26 (13%)	104 (52%)	0 (0%)	100%
Queer	40 (20%)	56 (28%)	90 (45%)	14 (7%)	100%
Homosexual	96	0	104	0	100%
Heterosexual	96	0	104	0	100%
Homophobia	75 (37.5%)	21 (10.5%)	95 (47.5%)	9 (4.5%)	100%
Are LGBT people more likely to be infected with or carry sexually transmitted diseases (STDs)?	52 (26%)	44 (22%)	90 (45%)	14 (7%)	100%
Are LGBT people more likely to be involved in substance abuse?	50 (25%)	46 (23%)	76 (38%)	28 (14%)	100%
Are you aware of the Section 377 IPC & recent judgment regarding it by the Supreme Court of India?	36 (18%)	60 (30%)	102 (51%)	02 (1%)	100%
What is the principle source of information on LGBT?	Peers, Internet, Electronic media		Lectures, Peers, Internet, Electronic media, Print media.		

All the participants were aware of the acronym LGBT & regarding LGBT movement. All students were having knowledge & understanding regarding terms: lesbian, gay, bisexual, homosexual & heterosexual. 13% students (all from first year) were unaware of the term transgender. 42% students mostly from first year were unaware of the term queer. 30% students mostly from first year were unaware of the term homophobia. 71% students say that LGBT people are more likely to be infected with or carry STDs like AIDS, Gonorrhoea, Syphilis etc.

63% students say that LGBT people are more likely to be involved in substance abuse like alcohol, tobacco, cocaine, solvent abuse etc. 69% students mostly of second year were aware of the Section 377 IPC & recent judgment regarding it by the Supreme Court of India. Among the different sources of information regarding LGBT, lectures were principle source for second year students whereas peers were principle source for first year students. Internet, electronic media & print media are the other important sources of information.

Table 3: Acceptance Level: Will you accept or not accept the following situations?

Situations	Acceptable	Neutral	Unacceptable	Don't know/ no comment
Your family member is from LGBT group	108 (54%)	41 (20.5%)	38 (19%)	13 (6.5%)
Your friend is from LGBT group	138 (69%)	37 (18.5%)	22 (11%)	3 (1.5%)
Your neighbour at hostel is from LGBT group	157 (78.5%)	33 (16.5%)	5 (2.5%)	5 (2.5%)
Your teacher is from LGBT group	161 (80.5%)	25 (12.5%)	9 (4.5%)	5 (2.5%)
A LGBT person holds a senior position/ position of authority in the organization you work for.	151 (75.5%)	30 (15%)	10 (5%)	9 (4.5%)
You encounter LGBT patient during clinics	185 (92.5%)	9 (4.5%)	4 (2%)	2 (1%)
Your routine patient turns out to be from LGBT	168 (84%)	24 (12%)	2 (1%)	6 (3%)
Same sex marriages	117 (58.5%)	42 (21%)	34 (17%)	7 (3.5%)

While evaluating acceptance level, most of the students were acceptable to the LGBT person as a friend (69%), neighbor (78.5%), teacher (80.5%), senior/ authoritarian (75.5%) & patient (92.5%). But the acceptance level drops (54%) when this LGBT person is a family member & also same sex marriages are unacceptable to 41.5% students.

Table 4: Discrimination Faced: Following are some possible situations faced by LGBT people:

Situations	Serious	Average	No problem at all	Don't know/ no comment
A doctor discriminates LGBT patients & they receive lower quality care	183 (91.5%)	7 (3.5%)	2 (1%)	8 (4%)
An institute refuses to employ a doctor qualified for the job due to his/her sexual orientation	176 (88%)	19 (9.5%)	1 (0.5%)	4 (2%)
A medical club/ association/ organization refuses to accept him/ her as its member	158 (79%)	32 (16%)	6 (3%)	4 (2%)
A warden/ landlord refuses accommodation	124 (62%)	66 (33%)	0 (0%)	10 (5%)
A student is discriminated against at school/ college	179 (89.5%)	21 (10.5%)	0 (0%)	0 (0%)
Verbal/ physical/ cyber bullying of LGBT person at school/ college	177 (88.5%)	19 (9.5%)	0 (0%)	4 (2%)
Comparatively they have higher chances of developing anxiety & depression	149 (74.5%)	33 (16.5%)	9 (4.5%)	9 (4.5%)

Most of the participants find discrimination faced by LGBT people as serious issue in various situations like at medical practice (91.5%), employment (88%), clubs/ associations (79%), accommodation (62%), school/ college (89.5%), bullying (88.5%) & resulting anxiety & depression (74.5%).

Table 5: Ways to address the problem of discrimination faced by LGBT people:

Ways	Agree	Neutral	Disagree	Don't know/ no comment
Society should ensure equal opportunities	192 (96%)	6 (3%)	0 (0%)	2 (1%)
Public education	187 (93.5%)	10 (5%)	1 (0.5%)	2 (1%)
Teaching scientific facts about LGBT as a part of sexuality education in schools	182 (91%)	16 (8%)	2 (1%)	0 (0%)
The government should introduce separate legislation to outlaw discrimination on the ground of sexual orientation (admission/ employment/ promotion/ public facilities etc)	132 (66%)	35 (17.5%)	33 (16.5%)	0 (0%)
There should be separate reservation for LGBT people in education & jobs	14 (7%)	37 (18.5%)	144 (72%)	5 (2.5%)

Most of the students are in agreement that equal opportunities (96%), public education (93.5%) & teaching scientific facts about LGBT as a part of sexuality education in schools (91%) are effective ways to address the problem of discrimination. 66% think that there should be separate legislation to outlaw discrimination on the ground of sexual orientation. But maximum students (72%) are against separate reservation for LGBT people in education & jobs.

Table 6: Attitudes towards LGBT people:

Attitudes	Agree	Neutral	Disagree	Don't know/ no comment
Work ability is not directly related to sexual orientation	183 (91.5%)	7 (3.5%)	6 (3%)	4 (2%)
Promiscuity is not directly related to sexual orientation	115 (57.5%)	30 (15%)	19 (9.5%)	36 (18%)
LGBT are psychologically normal people	148 (74%)	28 (14%)	14 (7%)	10 (5%)
Sexual intercourse between them is against order of nature	53 (26.5%)	46 (23%)	82 (41%)	19 (9.5%)
Violence/ discrimination based on sexual orientation	17 (8.5%)	24 (12%)	147 (73.5%)	12 (6%)
Homophobia contributes to discrimination/ violence	98 (49%)	26 (13%)	35 (17.5%)	41 (20.5%)

91.5% participants think that LGBT people are equally competent at work. 74% think that LGBT people are having normal psychology. 57.5% students think that there is no relationship between sexual orientation & sexual promiscuity. 41% students think that sexual intercourse between two LGBT people is with the order of nature. Most of the students (73.5%) are against the violence or discrimination based on sexual orientation. Nearly half of the participants (49%) think that homophobia contributes to discrimination & violence.

Discussion

Supreme Court of India verdict (2018)⁶: Consensual adult gay sex is not a crime and article 14 (right to equality) & 21 (right to life & personal liberty) of Indian Constitution contradict the present view of Section 377. There is lack of Indian literature⁷ that has systematically investigated issues related to LGBT people & patients in medical practice and this is an effort to study the knowledge and attitude of medical students

towards the same in an Indian set up. Knowledge about homosexuality emerged as the strongest predictor of a positive attitude towards them. The Association of American Medical Colleges has recommended that “medical school curricula ensure that students master the knowledge, skills and attitudes necessary to provide excellent, comprehensive care for LGBT patients” by including “comprehensive content addressing the specific healthcare needs of LGBT patients” and “training in communication skills with patients and colleagues regarding issues of sexual orientation and gender identity.”⁸

First year students (10% - 28%) were unaware of the terms like transgender, queer & homophobia. 30% students (first year) were unaware of the Section 377 IPC & recent judgment regarding it by the Supreme Court of India. That’s the reason why 24% to 46% of the participants remained neutral when asked regarding social impact of recent Supreme Court judgment regarding Section 377 IPC. From the pattern of responses, our study proves beyond doubt that degree of knowledge had significant predictive effect on attitudes in the analyzed predictive model & is important tool in shaping the attitudes towards LGBT patients and reducing stigmatization.

Conclusion

Through this study the researcher found the following findings:

- The study showed that the second year students have more knowledge than the first year students. Degree of knowledge had significant predictive effect on attitudes.

- Academic lectures play vital role in understanding the different related terminologies, problems (medical, psychological & social) faced by LGBT people & different ways to address such problems.

- Most of the students were acceptable to LGBT person as a friend, neighbor, and teacher, senior / authoritarian & patient. But this acceptance level drops (54%) when this LGBT person is a family member.

- Most of the participants find discrimination faced by LGBT people as serious issue & 66% think that there should be separate legislation to outlaw discrimination on the ground of sexual orientation.

- Most of the participants think that LGBT people

are psychologically normal & their work ability is not directly related to their sexual orientation.

- Most of the participants also support the LGBT rights movement.

Recommendations:

- Public education
- Teaching scientific facts about LGBT as a part of sexuality education in schools.

- The government should introduce separate legislation to outlaw discrimination & Violence.

- Counsellors & counselling centres in medical colleges & schools.

- Accessibility to appropriate and accurate information regarding sexual orientation at early stages through library and Internet resources as well as workshops and forums.

- To change societal attitude media has to play a responsible role by reporting on LGBT issues and promoting a culture of tolerance and freedom for minorities.

- Legal funds need to be created that can take on Public Interest Litigation on LGBT issues.

- Training needs to be conducted for health professionals to increase their understanding of LGBT identity as potential risk factor for self-harm, suicidal behavior and depression.

- Respective authorities should ensure that health, mental health and social care services are provided in a way that is accessible and appropriate to LGBT people.

- National & state government should develop initiatives to support employers in making workplace and workplace culture more supportive and inclusive of LGBT people.

- Police force needs to be sensitized on LGBT issues and general principles of fundamental human rights.

- Stigmatizing or pathologizing language regarding LGBT persons should be avoided.

- Local authorities, policy makers, schools and families need more education on gender identity equally,

applying policies and programs in friendly manner

Conflict of Interest: No conflict of interest was reported during conduction of study and preparation of this research article

Source of Funding: No fund was taken to carry out this study and preparing the article.

Ethical Clearance: Due ethical clearance from institutional ethics committee was taken.

Causes and Factors in Road Traffic Accidents at a Tertiary Care Center of Western Uttar Pradesh

Pradeep Kumar Agarwal¹, Pranav Kumar², Harnam Singh³

¹Associate Professor; ²Assistant Professor; ³Professor and Head, Muzaffarnagar Medical College, Muzaffarnagar, U.P.

Abstract

Road Traffic Accidents are one of the leading causes of morbidity and mortality in the world. The etiological factors may be classified into human and environmental out of which human factors are much more responsible for number of accidents. This study was carried out on Road Traffic Accidents cases reported to casualty department of Muzaffarnagar Medical College, Muzaffarnagar (U.P) from 1st July 2016 to 30th June 2017. The main objectives of the study were to know the causes and factors responsible for the accidents. Data were collected and analyzed. A Total of 416 cases were included in the study. Human error is responsible for accidents in 78% of cases in which drivers were at fault in 57.0% of cases followed by the pedestrians and passengers of vehicles who were responsible for 18% and 3.0% cases respectively. Faults in vehicles and poor weather accounted for accidents 8.0% & 7.8% of total cases respectively. Bad roads were responsible for accidents in 4.0% of total cases. None of the driver or passengers of the vehicles was wearing helmets or seat belts which are a very alarming trend. The important human factors responsible for accidents were over speeding, rash driving, violation of traffic rules, carelessness, wrong crossing, playing on roads, alcohol intake, fatigue or sleepiness.

Keywords: - Road traffic accidents, Causes, Risk factors, Human error, Drivers.

Introduction

Road Traffic Accidents are one of the leading causes of morbidity and mortality in the World. WHO data show that in 2016 nearly 1.35 million people died worldwide as a result of Road Traffic Injuries. However, the rate of death relative to the size of the world's population has remained constant.¹ In 2002, Road Traffic Injuries were the ninth leading cause of disability-adjusted life years (DALYs) lost, accounting for over 38 million (DALYs) lost, or 2.6% of the global burden of disease. Low and middle income countries account for 91.8% of the DALYs lost to road traffic injuries worldwide. According to WHO data for 2002, Road Traffic Injuries accounted for 2.1% of all global deaths and ranked as

the 11th leading cause of death. These road traffic deaths accounted for 23% of all injury deaths worldwide. Road traffic injuries constitute a major public health and development crisis and are predicted to increase if road safety is not addressed adequately.² A total of 4,64,674 road accident cases were reported during 2015. Road accident cases in the country have increased by 3.1% (4,64,674 in 2015 from 4,50,898 in 2014) during 2015 compared to 2014. The fatalities in road accidents have increased by 5.1% (from 1,41,526 in 2014 to 1,48,707 in 2015) during 2015 over 2014. It is observed that rate of deaths per thousand vehicles has decreased marginally from 1.0 in 2011 to 0.8 in 2015, although the number of vehicles in the country have increased by 28.6% (from 1,41,866 in 2011 to 1,82,445 in 2013) and the quantum of road accidents has increased by 5.6% during same period.⁴ 64,674 road accidents caused 1,48,707 deaths and injuries to 4,82,389 person during 2015. Generally road accidents have caused more injuries than deaths but in Punjab and Uttar Pradesh road accidents caused more death compared to persons injured.³ Accidents constitute a complex phenomenon of multiple causation.

Corresponding Author:

Dr. Pranav Kumar,

The etiological factors may be classified into two broad categories human and environmental.⁴ The present study was conducted to explore the various causes and factors responsible for RTAs for better prevention and management of Road traffic accidents.

Material & Method

The present study was conducted in the department of Forensic Medicine at Muzaffarnagar Medical College, Muzaffarnagar a tertiary care teaching hospital from 1/7/2016 to 30/6/2017. During this period a total of 416 cases of Road traffic accidents were reported to casualty department. This study was a prospective study. The relevant data was collected from casualty medical officer, treating doctor, police, relative accompanying the patients and from case files. In few cases adequate information was not obtained and such cases were put under unknown group. A detailed Performa was prepared for filling the observations on the present study. The information thus collected was statistically analyzed.

Observation and Result

During our study period 416 cases were admitted to the hospital with diagnosis of Road Traffic Accidents. The causes of accidents were analyzed in detail. In our study human error was responsible for accidents in 78% cases out of these drivers were at fault in 57% cases followed by pedestrians and passengers responsible for accidents 18% and 3% cases respectively. Present study showed that vehicle and weather were responsible in 8% and 7.8% cases respectively. Poor and defective roads lead to 4% of fatal accidents and in 2.2% cases the cause was unknown. (Table-1) In this study the common fault of drivers responsible for fatal accidents were due to over speeding (49.8%), rash driving (30.8%),

loss of control (6.8%), violation of traffic rules (5.5%), alcohol intoxication (4.2%), fatigue or sleepiness (2.9%). (Table-2) In present study out of 75 pedestrians responsible for accidents, 58.8% were careless in crossing roads, 20% were crossing from wrong side, and 16% of children were playing on roads and 5.2% were vulnerable due to old age and diseases. (Table-3) Out of 12 passengers responsible for fatal accidents, 50% were catching or getting down of running buses, 33.4% were travelling on foot board of buses, 8.3% were catching the buses from wrong side of the road and 8.3% of passengers were projecting outside the body of the vehicle when they fell out. (Table-4) In this study out of total 34 cases of accidents attributed to faults of vehicles, 29.8% of vehicles were overloaded or overcrowded, 26.7% of passengers ejected out of open jeeps during collision. These open jeeps are used to ferry passengers illegally. Wrongly parked vehicle on roads leading to accidents at night accounts for 17.8% cases. In this study 14.2% of vehicle has failure of brakes or steering, 8.5% had a tire burst at high speed leading to accidents due to overturning or collision with vehicles or trees. In 3% of cases, projecting loads from rear of trucks accounted for the accidents. (Table-5) Regarding the effect of the poor weather, 46.7% cases occurred at night due to poor vision and fog or mist account for 44.2% cases and 9.1% of cases due to heavy rain or storms in this study. Our study showed that out of 17 cases of accidents due to poor road condition, 34.4% occurred due to stray animals on road and 29.5% due to potholes and damaged roads. In 23.5% cases merging of rural roads directly to a highway with high speed traffic were responsible for accidents. 6.3% cases each occurred due to diversion or construction material on the road and illegal speed breakers, respectively. (Table-6)

Causes and Factors in Road Traffic Accidents at a Tertiary Care Center of Western Uttar Pradesh

Table - 1 Causes of fatal Road Accidents

Causes	Cases	Percentage (%)
Human Error	324	78.0
1. Fault of Drivers	237	57.0

Discussion

Road Traffic Accidents are mainly caused by the rapid increase in vehicles on roads, personalized modes of transport, lack of road discipline and improper roadway features. India accounts for about 10% of road accidents fatalities world wide and 85% of all road accidents occurred in the developing countries.² In the present study road traffic accidents accounted for 416 cases. The factor of human error is found to be most significant (78%) as compared to defects in vehicles, roads or weather conditions similar to other study.^{6-9,13} The drivers were at fault in 57% of cases & were responsible

for over speeding in 49.8% cases, rash driving in 30.8% cases. Violation of traffic rules, alcohol intake, fatigue or sleepiness were other causes.^{7,8} Pedestrian comprising of elderly & children are most commonly affected group of road accident victims. Majority of them are themselves responsible for accidents due to carelessness (58.8%), Wrong crossing (20%), children usually playing on roads (16%) and diseases in elders (5.4%).^{8,9,13} The common faults of passengers were catching running bus (50%), travelling on foot boards (33.4%), catching from wrong side (8.3%) and projecting outside the vehicle (8.3%).^{7,8,13} In the cases of accidents attributed to faults of vehicles, 29.8% of vehicles were overcrowded or over loaded, in 26.7% of cases victim ejected out of open jeeps at the time of collision. A small number of vehicles had mechanical failure in form of steering or brake failure (14.2%) or tire burst (8.5%) at high speed.^{6,7,13} Poor weather condition like night or poor vision (46.7%), fog or mist (44.2%), heavy rain or storm (9.1%) responsible for accidents which is consistent with other studies.^{7,13,14} Factors related to roads like stray animals on road (34.4%), potholes or damaged road (29.5%), merging of rural road with highway (23.5%) and diversions or material on road (6.3%), illegal speed breakers (6.3%) were responsible for accidents. Findings are consistent with other studies.^{7,14} The most disturbing finding in the present study was that none of the drivers and passengers of motor bikes or four wheelers were wearing helmets or seat belts leading to fatal injuries.¹⁰⁻¹³

Conclusion

The tragedy of Road Traffic Accidents is that they particularly involve young, perhaps the young and adventurous ones more. Human error is the most common cause of road accidents out of which drivers are at fault in many cases, followed by faults of pedestrians and passengers. The defects in vehicles, poor road infrastructure and poor weather accounts for a smaller number of cases. Fatal accidents represent not only tragic family loss but also a serious economic loss to the community as their education and training have been wasted. Such incidences can be prevented by giving proper education, awareness, training of safety standards by administrators and law enforcement agencies. There should be road safety programmes regularly in which all the cities of our country must be ranked and sensitized on the basis of various criteria like standards of roads, functioning of traffic signals, obeying of traffic rules by the citizen etc.

Toxicological Trends of Poisoning in a Tertiary Care Center of Western Uttar Pradesh

Pradeep Kumar Agarwal¹, PranavKumar², Harnam Singh³

¹Associate Professor, ²Assistant Professor, ³Professor and Head, Muzaffarnagar Medical College, Muzaffarnagar, U.P.

Abstract

Poisoning is a significant global public health problem which leads to nearly a million deaths per year. Incidence of poisoning is high in India. This study was carried out on poisoning cases reported to casualty department of Muzaffarnagar Medical College, Muzaffarnagar from 1st January 2016 to 31st December 2016. The main objectives of the study were to analyze pattern and demographic variables of poisoning cases. Data were collected and analyzed. A total of 72 cases (male: 46, female: 26) were included in the study. Maximum cases were of age group 21-30 years (30.5%). More cases from rural area (75%) were reported. Summer months saw maximum number of cases (37.5%). Poisoning by Organophosphorus was seen in maximum cases (31.9%) followed by Aluminium phosphide (29.1%) and in maximum cases reason for poisoning was Intentional (52.7%) and route of exposure was by oral ingestion (84.7%). The study concludes that the burden of poisoning demands strategies for identification, prevention and its rational management.

Key Words: Poisoning, Organophosphorus, Aluminium phosphide, Casualty

Introduction

Poisoning is a major problem all over the world, though the type of poison and the associated morbidity and mortality varies from place to place and changes over a period of time. Worldwide, an estimated three million cases of pesticide poisoning occurs every year, resulting in an excess of 250000 deaths. Of these 90% of fatal poisonings occurs in developing countries particularly amongst agriculture workers.¹ An estimated total of 877000 people committed suicide worldwide in 2002 and around 28% of these cases are from South East Asia Region.² The exact incidence of this problem in India remains uncertain but, it is reported that 1 to 1.5 million cases of poisoning occurs every year, of which nearly 50,000 dies.³ The last quarter of century has seen tremendous advances in the fields of agriculture,

industrial technology and medical pharmacology. These advances have been paralleled with remarkable changes in trends of acute poisoning in developing countries, including India.⁴ The commonest cause of poisoning in India is pesticide due to easy availability, agriculture based economy and poverty. In developing countries like India occupational poisoning is common due to illiteracy, unsafe practices like storing the pesticides at home and handling them without safety gear.⁵ Intentional and unintentional pesticide poisoning has been acknowledged as a serious health problem in many agriculture communities of low and middle income countries. WHO and other humanitarian organizations are coercing the authorities of different countries to ban the highly toxic pesticide and imposing restrictions to their access. Controlling access to pesticide is not only critical in reducing self-directed violence, it is a key to preventing unintentional poisoning. Studies indicate, the ban must be accompanied by evaluation of agriculture needs and replacement with low risk alternative for pest control.⁶ The paucity of information on risk population, circumstances and toxics is a hurdle to effective poisoning prevention and targeted intervention programs. So the study is sought to characterize poisoning with regard to

demographic factors and common toxic agents in our region.

Material & Method

The present study was conducted in Muzaffarnagar Medical College, Muzaffarnagar, a tertiary care teaching hospital from 1st January 2016 to 31st December 2016. During this period a total of 72 cases of poisoning were reported to casualty department. This study was a prospective study. The relevant data was collected from casualty medical officer, treating doctors and from case file. Data related to name, age, sex, religion, marital status, economic status, type of poison ingested, mode of ingestion, rural & urban distribution of cases, occupation was collected in standardized proforma & analyzed. Brought dead cases were not included in this study.

Observations & Results

During our study period seventy two cases were admitted to the hospital with diagnosis of acute poisoning. Males were more prone to poisoning (63.9%) as compared to females (36.1%). (Table 1) The incidence of poisoning according to age revealed that there was an

increasing trend of poisoning with increase in the age up to 30 years with a peak incidence in the age group 21-30 years which represented 22 (30.5%) cases in this study and then declined. (Table 2) Among the 72 cases admitted to the hospital with diagnosis of acute poisoning 46 (63.9%) cases were married followed by unmarried 25 (34.7%). Incidences are more with rural areas 54 (75%) then urban areas 17 (23.6%). Out of 72 cases incidences was more in middle class 47 (65.3%) followed by lower cases 24 (33.3%). In present study incidence of poisoning was more in farmers 26 (36.1%) and laborers 15 (20.8%) (Table 3) Intentional poisoning was more common 38 (52.7%) followed by accidental 30 (41.7%). (Table 4) Out of all cases reported, oral ingestion was the most common route of exposure 61 (84.7%) followed by inhalation 10 (13.9%). (Table 5) Poisoning was more during summer season 27 (37.5%) followed by winter 24 (33.3%) and monsoon 21 (29.2%). The poisons used were organophosphorus (31.9%), Aluminium phosphide (29.1%), Alcohol (13.9%), rat poison (6.9%), Kerosin (2.8%). Among these Organophosphorus poisons are the most commonly abused poison followed by Aluminiumphosphide. (Table 6)

Toxicological Trends of Poisoning in a Tertiary Care Center of Western Uttar Pradesh

Table 1: Sex wise Distribution of Cases (N=72)

Sex	No. of Cases	Percentage (%)
Male	46	63.9

Discussion

Poisoning cases, pesticide poisoning in particular impose a huge burden on the economy in developing countries. According to a study from India it is found that around 27% of pesticide poisoning cases require ventilation for varying periods which causes an unusual burden on already stretched health care system like India.⁷ It is known that the pesticides that cause most deaths in rural Asia and in the world, are WHO class I and II organophosphorus pesticides, causing an estimated 2,00,000 deaths.⁸⁻¹⁰ The present study shows that most of the cases belong to the age between 21 to 30 years which constitute 30.5% of the total cases. This observation is consistent with the other studies.^{6,11} In this study it has been observed that there is decreasing trend of poisoning cases after the peak of 21-30 years and it is least in extremes of life. Further it has been observed that most of the cases are due to organophosphorous and other insecticide poisoning. This is in accordance with the other studies. (5,6,8-10) Out of total 72 cases studied 46 (63.9%) were male & 26 (36.1%) were female which is consistent with other studies.¹¹ In the present study 46 (63.9%) cases were married & around 25 (34.7%) were unmarried. This is consistent with other studies.¹¹ Rapid increase of indebtedness by farmers and failure to reimburse due to natural calamities like draught is the reason behind the increase in poisoning during summer season.^{11,12} India being an agriculture nation, handling of pesticides is a routine practice by farmers and their family members. House hold and agricultural agents were associated with most poisoning due to easy availability of these agents & inadequate knowledge to support their safe residential use. Studies have shown pesticides is the most common toxic agent involved in poisoning.¹¹⁻¹⁴ In the present study intentional poisoning is more common which is consistent with other studies. (Mentioned above) In the present study it has been observed that incidences are more among rural population (75%) than urban population (23.6%) which is consistent with other studies.¹¹⁻¹⁴ It is worth noting that incidences of poisoning is more in middle class 47 (65.3%) followed by lower class 24 (33.35) which is consistent with other studies.¹¹ In the present study it has been observed that oral ingestion is the most common route of exposure 61 (84.7%) followed by inhalation 10 (13.9%).¹²⁻¹⁴

Conclusion

Increased Intentional Poisoning in adults emphasizes

on importance of Counseling & awareness about depression and stress affecting the major strata of the Society which increases suicidal tendencies. As in India, two third of populations economy is based on agriculture, of which majority lives in rural area. The reason of intentional poisoning by farmers is indebtedness, which may be due to natural calamities like- draught, Flood, etc. Authentic data on poisoning was not available not only from India but from entire SEAR (South East Asia Region). WHO States that many cases go unnoticed and mortality may actually be higher. Involvement in poisoning young male group which is most active and productive, puts huge burden on economy and social loss to the country. Pesticides again are clear culprit in most of the cases. In one sentence it may be stated that self harm pesticide poisoning is most common type of poisoning which is more common in rural areas and most of the cases are from age group 21-30 years.

Abstract

Background: Fatal burns and related injuries are major cause of death and disability. There are certain pathological changes such as lungs shows necrotizing pneumonia, congestion of alveolar walls, capillary proliferation, intra alveolar oedema, giant epithelial cells

Objective: To study on the cause of death due to burn cases and histopathological changes in north Indian setting.

Method: This was a cross-sectional study. All autopsies with history of burn injury were studied to find out the significant histopathological change in lung. Cases was thoroughly studied using specially designed proforma that included demographic profile of deceased, history from relatives, police & hospital records, autopsy findings.

Results: The most common cause of death due to burn injury was found to be Sepsis (48.2%) and neurogenic shock (29.5%). On histopathological examination, Congestion in trachea was present in majority 434 (78.9%) cases while Tracheal soot particles were present in only 40 (7.3%) cases. Specimens of 375 cases were available for histopathology out of which 52 (13.9%) specimens were autolyzed. Changes suggestive of Pneumonia (50.1%), Congestion (83.7%), alveolar and interstitial haemorrhage (63.2%) were present in majority of the cases while changes suggestive of alveolar interstitial edema (64.3%), alveolar wall disruption (66.1%), inflammatory cells (55.5%), hyaline membrane (79.7%) and Fibrin strands (79.7) were absent in majority of cases. Capillary dilatation was present in 39.2%.

Conclusion: In the present study, an important observation in burn deaths is the Sepsis and Neurogenic shock. Congestion in trachea was most common on histopathological change.

Key words: Fatal burns, Cause of death, Histopathological change

Introduction

A severe burn injury is the most devastating injury a person can sustain and yet hope to survive. Every year

more than 2 million people sustained burns in India. Around 5 lakh people were treated as outdoor patients. About 2 lakh people admitted in hospital, of which 5000 people die each year¹. Thermal burns are more common incidents, which stands next to road traffic accidents in India. On an average, 1/4th of the deaths constitute death due to burns among all postmortem examinations conducted. Mortality rate due to burns in India is much more than any other developed countries². Histopathological changes in various organs are noted

in burn deaths. Lungs are usually congested and show marked edema³. Necrosis of alveolar epithelium and necrotic debris is present as a membrane in cases of shock lung. Gastric ulcers may occur within a day of burning. Curling's ulcers are produced in the duodenum in less than 10% of cases on 10th day in extensive burns. These ulcers are sharply punched out mucosal defects which may be superficial or deep. The liver shows cloudy swelling. The kidney shows cloudy swelling, capillary thrombosis and infarction. Presence of haem casts in medullary tubules is common. Renal obstruction leads to microcirculatory insufficiency and renal ischemia⁴. There is lack of information on the cause of death due to burns and histopathological changes from north Indian setting, hence this study was planned to study on the cause of death due to burn cases and histopathological changes in north Indian setting in a cross sectional study design.

Material and Method

This was a cross-sectional study conducted in the Department of Forensic Medicine and Toxicology in collaboration with Department of Pathology in a tertiary care hospital in north India over a period of one year.

All autopsies with history of burn injury were studied to find out the significant histopathological change in lung. The cases with time since death more than 24 hours were not to be included, as lungs undergo decomposition after 24 hour period of death were excluded from the study. Cases with previous history of lung diseases, anatomically distorted lungs were excluded were also excluded.

Cases was thoroughly studied using specially designed proforma that included demographic profile of deceased, history from relatives, police & hospital records, autopsy findings. Before taking the lung sample, proper consent was taken from the relatives after explaining the purpose of the study. After gross examination sections from different lobe were taken. These sections were sent to Department of Pathology

for microscopic examination through a multi-step process. Routine Hematoxylin & Eosin stains done. The histopathological changes were seen under microscope.

Results

The most common cause of death due to burn injury was found to be Sepsis (48.2%), followed by Neurogenic shock (29.5%), Hypovolemic shock (14.0%), Asphyxia (3.1%), Multi-organ failure (2.7%) and Cardio-respiratory failure (2.2%). Other causes contributed to death in 0.4% burn victims only (Table-1).

Table-1: Distribution of Burn Cases according to Cause of Death (N=550)

Cause of death	No. of cases	Percentage
Sepsis	265	48.2
Neurogenic Shock	162	29.5
Hypovolemic Shock	77	14.0
Asphyxia	17	3.1
Multi-organ Failure	15	2.7
Cardio-respiratory failure	12	2.2
Others	2	0.4
Total	550	100.00

On histopathological examination, Congestion in trachea was present in majority 434 (78.9%) cases while Tracheal soot particles were present in only 40 (7.3%) cases. Specimens of 375 cases were available for histopathology out of which 52 (13.9%) specimens were autolyzed. Changes suggestive of Pneumonia (50.1%), Congestion (83.7%), alveolar and interstitial haemorrhage (63.2%) were present in majority of the cases while changes suggestive of alveolar interstitial edema (64.3%), alveolar wall disruption (66.1%), inflammatory cells (55.5%), hyaline membrane (79.7%) and Fibrin strands (79.7) were absent in majority of cases. Capillary dilatation was present in 39.2% (Table-2).

Table-2: Histopathological Changes in Trachea and Lungs

Variables	Total	Absent		Present		Autolyzed	
		No.	%	No.	%	No.	%
Traches							
Congestion	550	116	21.1	434	78.9	0	0.0
Soot particle	550	510	92.7	40	7.3	0	0.0
Lung							
Pneumonia	375	135	36.0	188	50.1	52	13.9
Congestion	375	9	2.4	314	83.7	52	13.9
Capillary dilatation	375	176	46.9	147	39.2	52	13.9
Alveolar and interstitial edema	375	241	64.3	82	21.9	52	13.9
Alveolar and interstitial hemorrhage	375	86	22.9	237	63.2	52	13.9
Alveolar wall disruption	375	248	66.1	75	20.0	52	13.9
Inflammatory cells	375	208	55.5	115	30.7	52	13.9
Hyaline membrane	375	299	79.7	24	6.4	52	13.9
Fibrin strands	375	299	79.7	24	6.4	52	13.9

Discussion

Burn injuries are one of the most devastating injuries and constitute a major global public health hazard. Burns are the fourth most common type of injury worldwide after road traffic accidents, falls and interpersonal violence⁵ (World Health Organisation, 2018). Extensive development and growth of Information technology has made vast changes in recent years in medical education system in India at both the teaching level as well as research level⁶ (Tayade and Kulkarni, 2011).

There are numerous cases in which there was no soot in the larynx or trachea, yet analysis of blood for carbon monoxide revealed lethal levels⁷ (DiMaio, 2001). Introduction of soot into the trachea, either during incision on the charred neck at autopsy or by disintegration from burning, gives the false impression of smoke inhalation⁸ (Shkrum et al, 2007).

In this study, the most common cause of death due to burn injury was found to be Sepsis (48.2%), followed by Neurogenic shock (29.5%), Hypovolemic shock (14.0%), Asphyxia (3.1%), Multi-organ failure (2.7%) and Cardio-respiratory failure (2.2%).

Burn injury affects kidney by creating hypovolemic and intense pro-inflammatory states in the earlier phases of survival whereas in the later days systemic sepsis takes the upper hand for the development of the organ dysfunction. Congestion in trachea was present in majority 434 (78.9%) cases while Tracheal soot particles were present in only 40 (7.3%) cases. Specimens of 375 cases were available for histopathology out of which 52 (13.9%) specimens were autolyzed. Changes suggestive of Pneumonia (50.1%), Congestion (83.7%), alveolar and interstitial haemorrhage (63.2%) were present in majority of the cases while changes suggestive of alveolar interstitial edema (64.3%), alveolar wall disruption

(66.1%), inflammatory cells (55.5%), hyaline membrane (79.7%) and Fibrin strands (79.7) were absent in majority of cases. Capillary dilatation was present in 39.2% are the histopathological findings in the present study that is close to the studies of Sevitt (1956), Argamaso (1967), Rathod et al (2014) and Schrier et al (2004), 9,10,11,12. Naik et al (1998) in their study did not find soot in naked eye examination in any case of sustaining less than 60% total body surface area (TBSA) of burn¹³. Gupta and Srivastava (1988) found soot particles in trachea in total 38 cases (21.11%)¹⁴.

The emerging techniques, development of study of histopathological techniques plays a vital role in autopsy. Burn deaths are an important public health & social problem in India. There should be urgent need to implement burn prevention programme in India which should aim at attending the incidence of burn injuries and mortality among young generation, especially in females. Burn has been reported to be the second most common cause of death in all medicolegal cases.

Conclusion

In the present study, an important observation in burn deaths is the Sepsis and Neurogenic shock. Congestion in trachea was most common on histopathological change.

Conflict of Interest: There is no conflict of interest.

Client Satisfaction and Preferences Towards Nonverbal Communication(NVC) of Health Care Providers in a Therapeutic Setting, Mangaluru

Sonia Sequeira¹, Precilla D'Silva²

¹Assistant Professor, ²Lecturer, Father Muller College of Nursing

Abstract

Non verbal communication refers to the communication and interpretation of information by any means other than language. Non verbal communication is used to express and communicate thoughts, feelings and emotions to establish and maintain relationships and to influence others. In health care setting it is very important to maintain a healthy provider- client relationship. The present study studies the non verbal behaviors between doctors and nurses and ranks the client preference during interaction. The results revealed that there is no significant difference in the non verbal behaviours used by doctors and nurses. Henry Garret ranking was used to rank the preferences rated by Clients. Hence it is concluded that NVC are very much essential in health care.

Key words: Non Verbal communication, Therapeutic settings, Health care provider, Client

Introduction

Establishing good communication, either verbal or nonverbal, with patient is an essential and important component to develop a good health professional-patient relation. Numerous studies have explored the mechanisms and importance of nonverbal communications.¹ Face-to-face interaction (including facial expressions and eye contact), expressive touch, body language, paralinguistic's (vocal communication which is discrete from actual language), interpersonal proximity, physical appearance, and eloquent gestures all make verbal conversation more expressive and meaningful.² Evidence shows that health professionals (doctors and nurses) nonverbal behavior leads to higher patient satisfaction, but this is affected by a number of factors, including gender of the health personnel as well as of the patient. A study, from Switzerland, showed both male and female doctors should display different set of nonverbal behavior to maximize patients satisfaction.³ Nonverbal communication has been shown to be important in dealing with pediatric age groups and with those recovering from disabilities.⁴

A good health care provider begins to care for the patient as soon as he/she looks at him. In a study

conducted 86.1% of the patients eagerly wanted the doctor's attention through his/her eye contact. Even a simple gesture of frowning can have a positive impact on the patient's satisfaction.³ Eye contact and physical touch are commonly used as effective tools in nonverbal communication.^{1,5} Touch can be perceived as comforting and healing.⁶ Health care providers may feel reluctant to use touch other than procedural touch, because of the fear of misinterpretation of such behavior. However, many patients believe that, particularly in distressing situations, expressive touch is acceptable.⁷ Eye contact is another important nonverbal behavior and is especially essential for building good rapport with elderly individuals.³ It is mostly taken as a sign of respect, care, and attention from a care provider.¹ However, if eye contact is coupled with active listening it inclines the interaction towards more patient-centered communication.³ Nowadays, the use of computers and especially the electronic health records (HER), is a big obstacle in using eye contact as an effective way to communicate.⁸ The Present study objectives are: To assess the level of client satisfaction towards NVC of the health care providers during the assessment, consultation and while providing care, to determine the preferences of the clients, To find the association between client satisfaction towards NVC of health care providers and selected demographic variables, To compare the satisfaction level of clients

towards NVC among doctors and nurses

Materials and Method

A Descriptive Survey was conducted among 200 Clients who were admitted to selected Hospital at Mangaluru. Eligibility criteria was clients with simple medical and surgical problems admitted after the initial assessment performed by the licensed doctor and a registered nurse. Samples were selected by convenient sampling. Information was collected by administering the rating scale to check the client satisfaction and a semi structured questionnaire. Apart from this demographic data is collected by giving a questionnaire. The tools after validation and pre-testing were administered to 10 clients admitted with minor medical and surgical problems to test the reliability. The satisfaction rating scale was checked for reliability using Cronbach's Alpha with $r=0.982$. Permission to conduct the study was obtained from Institutional Ethics Committee and from the Hospital Administrator

Section 5: Comparison on satisfaction between Doctors and Nurses NVC

Section I

Table 1: Client Satisfaction towards Doctors NVC

n=200

Satisfaction Score	Satisfaction Score %	Grading	Doctors		Nurses	
			f	%	f	%
101-125	≥80%	Highly satisfied	91	45.5	94	47.0
76-100	61-79%	Moderately Satisfied	70	35	81	40.5
25-75	≤60%	Not satisfied	39	19.5	25	12.5

Maximum score: 125

The above table interprets that 45.5% and 47.0% of the clients were highly satisfied with the NVC shown by the doctors and nurses .

Table 2: Area Wise Mean, Standard Deviation and Mean Percentage of Client Satisfaction towards Doctors Non Verbal Communication

n=200

Area	Item	Max. score	Doctors			Nurses		
			Mean ± SD	Mean satisfaction %	Level of Satisfaction	Mean ± SD	Mean satisfaction %	Level of Satisfaction
Gestures and interpersonal proximity	16	80	61.80±13.07	77.25%	Moderately Satisfied	63.54±11.50	79.42%	Moderately Satisfied
Facial expression, eye contact, touch, body language, appearance	9	45	35.41±7.32	78.68%	Moderately Satisfied	36.41±6.64	80.91%	Highly satisfied
Total	25	125	97.22±20.06	77.77%	Moderately Satisfied	99.95±17.85	79.96%	Highly satisfied

Findings

Master data sheet is prepared and the coded data was entered. SPSS-16 version was used to analyze coded data. Frequency and percentages of baseline variables were analyzed. Chi-Square test was used to find the association. Henry Garrets Ranking is used to interpret the client preferences for NVC

The data collected were organized under the following headings

Section 1: Client Satisfaction towards Doctors NVC

Section 2: Association of Doctors and nurses Satisfaction with baseline variables

Section 3: Client Preferences towards NVC

Section 4: Henry Garrett Ranking for priority in Preferences for NVC

From the above table it is clear that there is large deviation from the mean value in the satisfaction level of clients.

Section: II

Table 3: Association of Client Satisfaction of Doctors NVC with baseline variables n=200

Sl.No	Variables	< Median	≥ Median	p Value
1	Age			0.000*

Data in table 7 shows that p value computed between clients Satisfaction of Nurses Non Verbal Communication and age (0.037), Occupation (0.0001), Marital Status (0.001), Gender (0.034) is < 0.05, at 0.05 level of significance. Hence null hypothesis was accepted only for those areas.

Section: III

Client Preferences towards Health care providers Non Verbal Communication

The analysed data reveals that majority, 177(88.5%) showed approval of physical touching of their body by the health care provider during Interaction. More than half, 118(59%) consider the touch of health care provider as therapeutic. Most, 125(62.5%) consider hand and

105(52.5%) consider shoulder as the comfortable part to be touched during the interaction. Most of them 178 (89%) wants their health care provider to maintain eye contact during interaction. 161(80.5%) feel comfortable when health care provider of opposite gender maintains eye contact. Almost all clients 189(94.5%) expect their health care provider to acknowledge with a pleasant smile. 167(83.5%) prefer their health care provider to wear apron and ID card during interaction/consultation. 106(53%) expect the health care provider to make them comfortable before starting the interaction and 107(53.5%) wants their health care providers to build confidence. Majority 176(88%) expect family member to be present during consultation/interaction. More than half 108(58%) prefer senior health care provider during consultation.

Section: IV

Table 5: Henry Garrett ranking for Preferences of Clients towards health care providers NVC

n=200

Factor No.	Factors	Rank
1.	Greeting with a smile	1
2.	Making comfortable	2
3.	Asking problems	3
4.	Nodding head	4
5.	Maintaining physical distance	5
6.	Allow a family member to accompany during interaction	7
7.	Give complete instructions regarding treatment	8
8.	Give time to discuss your problem with the health care provider	6

Section: V

Table 6: Comparison on satisfaction between Doctors and Nurses NVC (Independent Samples Test)

F		Levene's Test for Equality of Variances		t-test for Equality of Means						
		Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference		
								Lower	Upper	
T test	Equal variances assumed	3.838	.051	1.440	398	.151	2.73500	1.89904	-.99840	6.46840
	Equal variances not assumed			1.440	392.702	.151	2.73500	1.89904	-.99856	6.46856

There is no statistically significant difference between the satisfaction of doctors and nurses towards non verbal communication (p>0.05).

Conclusion

The present study attempted to determine the client satisfaction towards non verbal communication of doctors and nurses in a therapeutic setting at Mangaluru. The following conclusions were made based on the findings of the study:

- Clients were moderately satisfied with the health services provided by doctors and nurses

- There was significant association was found with few of the selected demographic variables with the satisfaction level

- There is no difference observed between client satisfaction towards non verbal communication among doctors and nurses.

The study concludes by interpreting that periodic training sessions on communication, soft skills

development, making the availability of sign boards and discussion of feedback obtained by the clients helps in improving the quality care.

Abstract

Ontology design and querying the data set to obtain accurate results has been a topic of research. The aim of the paper is to represent ontological knowledge in the field of Medical Information Systems to store the knowledge about Swine flu disease and thereby querying the data and formalize the knowledge base development. The developed knowledge from RDF is converted to rules and then querying is done through different methods and performance analysis has been done on the retrieved query. The results predicted determine the suitability of the method where querying gives the accurate result for swine flu disease ontology.

Keywords: Querying; Ontology; Swine-flu; Protégé; SPARQL;

Introduction

Semantic Web a layer of existing web enables machines to operate better and share meaningful knowledge. Semantic Web provides technology stack where key part is standardized information exchange. As part of Semantic Web, Computers should have access to structured collection of documents and sets of inference rules so that they conduct automated reasoning. Semantic web can otherwise be referred as Linked Data. Aristotle defined the term Ontology^[1,8,9] in his Metaphysics. In 1998, Studer et al.^[2] defined the term Ontology as : “An ontology is a formal, explicit specification of a shared conceptualization.” Conceptualization denotes abstract model being representing some phenomenon identifying Knowledge in detail with individual relationships. In our paper , We present our application for searching on appropriate semantic information on Swine flu in respiratory disease ontology which is a domain ontology .This we have done using Classes and Objects and the inter individual relationships which gives the information to patient or any person searching the Web such as what drug is suitable for a patient given his symptoms. Explicit states that type, constraint and their use is explicitly stated. Shared echoes the perception that Ontology represents consensual knowledge refers to some group and not individual. Features are described by Classes and attributes are represented by data properties. Instances are represented by individual

classes and querying to retrieve semantic information is done with the help of SPARQL. The main purpose of the paper is to communicate information retrieval ,querying through SPARQL and make an analysis of performance of web based applications to predict the query evaluation that gives accurate results when queried. The remaining part of the paper is organized as follows .Section 2 describes about the different tools used for Semantic Web and Section3 describes about the framework for the development of swine flu ontology and section4 presents analysis of NASA TLX INDEX^[3,4] on applying SPARQL^[5], Ontograf^[6], SWRL^[7] Queries on the ontology that is retrieved and the evaluation is presented in the form of graph and Section 5 concludes our work.

Tools used for Semantic Web in our Case Study

Respiratory diseases are the diseases caused due to the disorder of the air and lungs that affect the human respiratory system. These respiratory diseases may cause damage to the organs and the other internal structures that deal with the breathing, and may include nasal cavities, the throat, the bronchitis and many other organs present. Identification of these respiratory diseases and taking the correct predicate is a difficult task for a normal individual affected. Respiratory diseases cause the malfunction of the internal organs that block and cause damage to the lungs which may cause severe health issue. There are many diseases which are caused on the respiratory

system. Some of them namely, Asthma, Pneumonia, Upper respiratory tract infection, Infant respiratory distress syndrome, Cystic fibrosis, Shortness of breath, Obstructive lung disease, Bronchitis, Obstructive sleep apnea, Influenza-like illness, Acute severe asthma. These diseases may affect the human structures and organs directly. Knowledge of these diseases to the individuals is very much less rather than the experts in that domain. To get the knowledge about the diseases is very much difficult and that may happen only when the expertise help is provided to the user. To get the preventive measurements for a user without expertise help may end up in the wrong cause. To understand the content and to provide the better knowledge about the diseases ontologies provide an accurate representation to the user without the help of the expertise in that domain.

There may be various characteristics and different issues related to the diseases. Each of them are classified into the specific categories in the domain those are affecting different organs or the structures. Sufficient knowledge about the diseases and the corresponding precautions or about the diseases through the ontologies can help in removal of unnecessary damage and less spread of the wrong information through the web. Technologies that help to build a content oriented system is possible using semantic web^[10,11]. By using semantic web which provide information using the ontology help to show the related issues in the respiratory diseases, how it is caused and how it can be prevented. Much of the related information can be seen on the web rather than having the misguided information.

Methodology

Tools for Ontology Development

Protégé^[12,13] - Protégé is developed by Stanford University as a tool for Semantic Web and it is a framework for building Intelligent Web Systems. It can be adapted to build both simple and complex ontological applications where the concepts used are classes, objects and the inter individual relationships established among them. Protégé provides us meta modeling an the best part

is that there is no syntax involved and domain ontologies can be developed easily with this.

Jena – Apache Jena is open source framework based on Java. It provides framework to extract data from and write to RDF and graph which is represented as abstract model. Data can also be populated from databases, Files, URLs and also it has the API for creating and accessing RDF data.

RDF – A Resource Description Framework, is used as model for interchange of data on the Web. URIS are assigned to data objects and then RDF is used to create statements about them. RDF is used for serializing triples and RDF consists of Subject-Predicate-Object triple. This makes data easier to store and interchange.

SPARQL – An Acronym for SPARQL Protocol and RDF Query Language is used for querying, retrieving and manipulating data stored in RDF format. It allows us to search the Web and discover relationships among the classes and individual objects. SPAQRL takes text in the form of queries and return the results. SPARQL consists of SELECT queries which are similar to SQL thereby it is easy for the user to write if he has knowledge on the SQL queries. SPARQL produces results in three formats XML,JSON and CSV formats.

Ontograf – Ontograf provides support for navigating relationships of OWL ontologies. The various relationships that can be supported are subclass, individual, domain/range object properties, and equivalence. It provides zooming, spring layout, searchable relationship filters, configurable tooltips, pinning tooltips, OWL Imports View for better enhancement of views.

SWRL – SWRL rules can be executed through a tab in protégé SWRL Tab. It supports interoperating with other rule engines and there are other user-defined libraries and various built-in libraries are also provided mathematical, temporal and string operators. This language provide a powerful means extracting OWL Ontologies.

Framework For Swine Flu Disease Ontology

A framework for Swine Flu disease ontology is developed where ontology is created with the help of Protégé. Protégé helped in modelling of ontology classes. Classes used for development of Swine Flu disease are demonstrated in Fig1 .

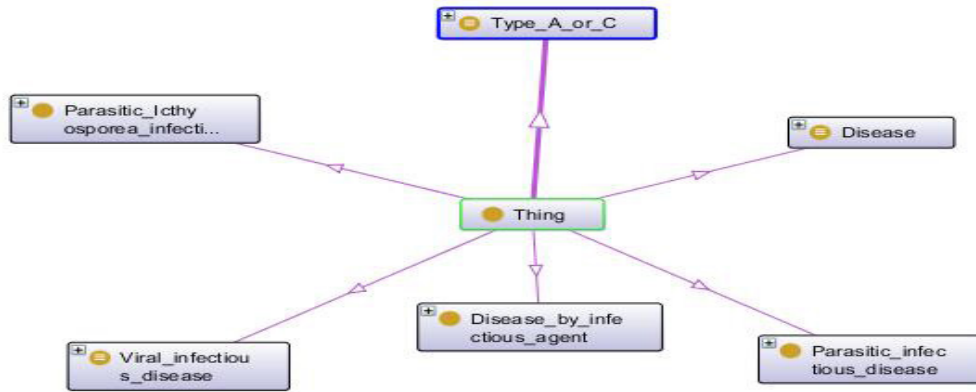

Fig1 : Display of Term Candidates in an Unstructured List

Classes used are highest occurrence of Disease and its diagnosis, Symptoms of individuals, Causes of disease, Its prevention and Vaccines, Etiology. Relationships used are Named_Disease, Caused_By, Used_to_diagnose, Types, Has_severity, Managed_To, Disease_Name, Managed_by, Used_to_cure, Inter individual relationships are represented in the following Fig2.

diseases.

After SwineFlu disease ontology is developed, the next step is we evaluated our ontology using a Fact++ Reasoner which verified the ontology by executing each class and their properties.

Results & Discussion

Performance Evaluation

Our paper deals with SwineFlu ontology to disseminate knowledge to the user regarding SwineFlu the symptoms risk factors vaccines drugs Type_A/ Type_c. we conducted one experiment to gather information regarding SwineFlu on two sets of users. One set of users has awareness on SwineFlu and the other does not have any awareness on SwineFlu. Taxonomy on SwineFlu ontology was shown in fig 1 where it comprised of classes, objects and instances. Various queries are posed on ontology and performance was evaluated as such which query gives the better performance. The type of queries used here are SPARQL Ontograf and SWRL.

PREFIX ab: <http://semanticweb.org/chandana/ontologies/2018/2/untitled-ontology-54#>
PREFIX ns: <http://semanticweb.org/chandana/ontologies/2018/2/untitled-ontology-54/swineflu#>
SELECT DISTINCT*
WHERE {
?subject ab:PatientID=50.
?subject ?predicate ns:hasSymptom swineflu
}
```

Fig 5: Query 4

Different users tried to find out the information regarding swineflu disease on the basis of results retrieved by SPARQL, Ontograf, SWRL. There after NASA TLX(Task Load Index) As been used for query analysis and time need to perform execution.

A comparative study on the results obtained by using different queries is done from this study. The SPARQL query has given higher efficiency and performance in retrieving the results when compared to other tools like ontograf, SWAL Query. This comparison states that SPARQL is far better suited than other tools in giving optimal results.

Fig 6. SPARQL, Ontograp, SWRL Query TLX and Time Comparison.

Conclusion

This paper gives knowledge on the creation of domain ontology for SwineFlu Disease and the queries are done using SPARQL. This gives performance analysis on ontological evaluation based on ontological tools. The analysis results state that SPARQL method is efficient method and it outperforms the other querying methods. Semantic web being intelligent web is used for developing ontology for swineflu that is useful for medical information systems that provides a linked data for the benefit of health care systems. This can be extended with machine learning to train the patterns so that ontology for other respiratory diseases can be developed in future.

Ethical Clearance- This research was approved by the Research and Ethics Committee of the ESI Hospital, Pulmonology center, Chest Diseases, ESI, Hyderabad,India.

Constitutionality of Attempt to Commit Suicide- Unlocking The Controversy

Smita Satapathy¹, Madhubrata Mohanty²

¹Ph.D. Research Scholar, ²Associate Professor, Faculty of Legal Studies, Siksha 'O' Anusandhan, Bhubaneswar, Odisha, India

Abstract

A person is born free but he does not have this freedom to choose his death. Suicide is a deliberate act of killing of oneself. Suicide as such is not a crime but when an attempt is taken it can be considered as one under Section 309 of Indian Penal Code. The debate round the corner is whether attempt to commit suicide should be punished or not. A person was aware of the outcome of committing suicide, still knowingly takes an attempt. Suicide as a problem is the mixture of social, psychological, philosophical, moral, ethical and legal reasons behind it. An act of suicide requires grave awareness because there is nothing an ordinary prudent man fears more than his death, and that fear in the huge majority of cases, is as logical as it is inevitable. This paper has drawn the attention towards the ongoing debate of retaining or deleting Section 309 by testing its validity on the ground of Article 21 of the constitution of India which provides right to life as a fundamental right.

Key words- *Suicide, attempt, crime, right, life, death*

Introduction-

“To be, or not to be-that is the question:

Whether it is nobler in the mind to suffer,

The slings and arrows of outrageous fortune,

Or to take arms against a sea of troubles,

And by opposing end them.”

- Shakespeare, Hamlet, III, i.

The right to take one's own life has become much discussed topic throughout the world. A person who succeeds in taking away his life escapes all worldly miseries as well as legal action whereas one whose attempt fails is drawn into the dragnet of criminal courts. A person when enters into the stage of life finds only one entrance to go inside but with several exit doors to come out of which suicide is one such exit door. Several

researches are being made throughout the globe to find out the causes and outcomes of suicide. The World Health Organisation in 1968 while carrying on one such research found out suicidal act to be 'the injury with varying degree of lethal intent'. The Organisation further differentiated between suicidal acts with fatal outcome and non fatal outcome as- the former being coined as suicide and the later as attempted suicide. For whatever reason it might be caused, but suicide is never being appreciated as an act to be commended. Mythological treatises like the Holy Quran and Bible expressly prohibit the act of suicide. Hindu Dharma too believes that a person committing suicide will be devoid of attaining 'Moksha', i.e. free from the cycle of rebirth due to good fortune and that his soul will roam around with severe pain.¹

Suicide is a more of a concept related to moral, religious or psychological qualities of the person or the existing socio-economic, cultural circumstances of the society. Section 309 of the Penal Code deserves to be eradicated from the statute book to improve our penal laws. It is inhumane and illogical provision, and it may effect in punishing an individual all over again who has undergone pain and would be undertaking humiliation as of his unsuccessful attempt to commit

Corresponding Author-

suicide. For coming to a conclusion that Section 309 of the Indian Penal Code is obsolete, unreasonable and unkind the court appears to have closely relied upon 42nd Law Commission report which had in early 70's itself suggested the removal of the offence of attempt to commit suicide from the Penal Code.²

The question whether the crime of attempted killing oneself is punishable or not has been a topic of moral and legal debate over a long time. Right to life is a natural right embodied in Article 21 but suicide is an unnatural termination or extinction of life and therefore, incompatible and inconsistent with the concept of right to life; is not like other Fundamental Right such as the right to form associations and speech which are positive rights. Right to speech includes the right not to speak, the right to form associations, includes the right to form associations. But the right to life does not include the right not to live.³

The act of attempted suicide is always given more importance than the act of committed suicide as because in case of the later the culprit is no more alive to get punishment, but in the former case the culprit is still alive to get some deterrent punishment so as not to repeat the same offence in future. Section 309 of the Indian Penal Code categorically makes attempt to commit suicide punishable, but time and again there arose several debates on the necessity of retaining or deleting this section from the statute book. The judiciary too perceived the criminalization of suicide with contrasting views. While Article 21, the life-line of all fundamental rights under the Indian Constitution guaranteeing right to life and personal liberty, sometimes interpreted to be including right to die under its wrap, in some other cases it is bluntly denied of having any such interpretation. Considering the legislative intent behind insertion of penal provision for attempt to commit suicide in the 1860 statute, it could be very well understood the amount of importance given to the dignity of human life in that statute considering human life is precious not only for the person concerned holding it but also for the State which cannot stand blind-folded by allowing the person attempting to commit suicide set free without any punishment. Something deterrent would make the offender aware of the value of his life for himself as well as for others. The persons criticizing this view are of the opinion that the insertion of Section 309 under the Penal Code is altogether a wrong provision as it punishes the distressed person doubly who had tried to end his life due to deep depression. Instead of having sympathetic

approach towards the victim, if further punishment would be inflicted upon him it would be simply ruthless act. The supporters of this view also opine that why the State remain as a silent spectator in thousands of cases when saints due to their faith and belief went on fast for indefinite period without being punished under section 309? ⁴

If a person succeeds in committing suicide, he is saved from being convicted but if he survives he may face legal consequences. The logic is obvious Article 21 of the Constitution which is its backbone and the people who advocates the theory of deletion of Section 309 of IPC on the basis of Article 21 of the Constitution. Article 21 of the Constitution provides that "No person shall be deprived of his life and personal liberty except according to procedure established by law" So, it the duty of the State constitutionally that it should protect a citizen's life howsoever his condition is miserable.⁵

The problem of suicide is of controversial nature, The Constitution of India provides religious freedom from Article 25 to 28. However, no religion allows suicide, whether it is Hinduism, Christianity or Islam. Christianity prohibits suicide considering it as a sin which leads to a felony. In Hinduism it is considered that there is a process of rebirth, i.e. life after death. Still it appears that Hindu law does not permit Suicide. In Islamic law, it is believed that Allah has given the life to serve the society and it will be disrespect to Allah if someone takes his own life.⁶

Objective-

The purpose of research in this topic are-

1. To know whether the fundamental right to life includes right to die.
2. To know whether attempt to commit suicide under Section 309 of Indian Penal Code violates Article 21 of Indian Constitution.
3. To know how the Indian Judiciary is tackling these types of cases relating to attempt to commit suicide.

Constitutionality of Sec. 309 IPC with Reference to Fundamental Rights-

What is an attempt of commit suicide? An attempt implies at least an act towards the commission of suicide, such as drowning or poisoning or shooting oneself. If a person throws himself into a well with a view to

drowning himself, and if rescued, he is guilty of such an attempt as is punishable under this Section 309 IPC.

In *Emperor v. Mst. Dhirajia* [AIR 1940 All. 486] a twenty year old lady ran away from her husband's house after serious confrontation between the two with her six-month old child. The husband followed them and found them crossing the railway line. The lady apprehending him coming closure to them, got frightened and jumped into a nearby well with the baby in hand. This caused the death of the baby, but the lady was rescued with slight injury. The lady was subsequently charged with two offences- one for murdering her child and the other for attempting to commit suicide. The court, however, discharged her from the charge of murder of her baby considering absence of mens rea in the act as it was caused out of fear without any guilty intention. Regarding the second charge for punishing the lady under sec.309, the court was of the view that the word 'attempt' used under the provision speaks for some conscious effort made on the part of the offender to constitute the act, which was lacking in the instant case as the lady jumped into the well being frightened and without having the consciousness of the act she was committing.⁷

Regarding the Constitutionality of Sec. 309 of IPC, lots of diversifying views have come to the fore by the Hon'ble Apex Court time and again. For the first time the question was raised in the Delhi High Court in 1985 in the case of *State v. Sanjay Kumar Bhatia* [1985 CrL.J. 931] where the Division Bench headed by Sachar, J. Held the view that continuation of sec.309 in the Indian Penal Code would be an anachronism disgraceful for the Indian society. The court, however, not gave any comment on the constitutional validity of the provision.

In *Maruti Sripati Dubal v. State of Maharashtra* [1987 CrL. L.J. 743] the Division Bench of Bombay High Court presided by P.B. Sawant, J. Was of the view that Sec. 309 of IPC is violative of Art. 14 of the Constitution for being discriminatory in nature and for violating arbitrarily the equality guaranteed to the persons. The provision was further held to be violative of Art. 21 as right to life include the right to terminate one's own life also.

In *Chenna Jagadeshwar v. State of Andhra Pradesh* [1988 CrL. L.J. 549] the Division Bench of Andhra Pradesh High Court, however, rejected the above contention made by the Bombay High Court and held that Sec. 309 IPC is not violative of Article 14 and

Article 21 of the Constitution

The decision of the Bombay High Court in *Maruti Sripati Dubal's* Case is however, gained much momentum by the Supreme Court in *P. Rathinam v. Union of India* [1994 AIR 1844] where a Division Bench of the Court presided by B.L. Hansaria, J. held that right to life under Art. 21 of the Constitution doesn't speak for a right to live a forced life to one's own disadvantage. The court further reasoned out that Art. 21 ensures the right to live with dignity which in no way can include to live with continuous drudgery. To justify the point, the Court expressed its view in the following lines:

"One may refuse to live, if the living be not according to the person concerned worth living or if the richness and fullness of life were not to demand living further. One may rightly think that having achieved all worldly pleasure and happiness, he has something to achieve beyond this life. This desire to communion with God may very rightly; lead even a very healthy mind to think that he would forgo his right to live and would rather choose not to live. In any case, a person cannot be forced to enjoy right to life to his detriment, disadvantage or disliking".

While categorically declaring Sec. 309 IPC unconstitutional, the Court further reiterated that "attempt to commit suicide is in realty a cry for help and not for punishment" and that right to life includes right to die also. Considering the point from a humanitarian approach, the Court held that when a person due to his various sufferings from life problems attempts to kill oneself, but becomes unsuccessful, if will be penalized for his act, it would be completely inhuman. Rather efforts are to be made to mitigate his problems by using separate methods.⁸

The Bombay High Court's decision in *Maruti Sripati Dubal's* Case to include right to die within right to life is, however, not declared absolute to be exercised under all circumstances, rather it was applicable only under certain situations satisfying the act. It entails in the absence of sufficient reasons for the court to rely upon for the attempted suicide, the act would be considered as an offence being punishable under the law.

The *Rathinam* verdict created large hue and cry throughout the country and within few months only again the Apex Court came to review the ruling through a full bench Court in *Gian Kaur v. State of Punjab* [1996 AIR 946]. The important point raised before the court

against the previous judgment was that after the principal offence of attempt to commit suicide is declared void being violative of right to life under Art.21, how the abetment for the same can be made punishable under Sec. 306 of IPC? It was contended that right to die being a part of Art.21 after declaration of unconstitutionality of sec. 309, anybody abetting another to commit suicide be not punished as abettor, rather he be considered to be assisting the victim to put into effect his fundamental right under Art. Considering the far-reaching adverse consequence of the Rathinam verdict and to put an end to the much debated controversy, the Court overruled the decision and held that 'right to life and personal liberty' as enshrined under Art.21 of the Constitution by no stretch of imagination can be extended to include 'right to die'. Clarifying the point further the Court held that "Right to life' is a natural right embodied in Article 21 but suicide is an unnatural termination or extinction of life and, therefore, incompatible and inconsistent with the concept of right to life". The Court also differentiated between 'Euthanasia' and attempt to commit suicide by saying the former may come within the purview of right to live with dignity up to the end of natural life and thus may include the right of a dying man to desire to die with dignity when his life is ebbing out, but the later in no way be equated with it to allow a person to die an unnatural death reducing natural duration of life.

No Constitution can ignore the rights of individuals living in the country to lead a life with dignity, failing which the fundamental rights available to the citizens will be meaningless. Keeping the judicial analysis made above in view, it can be asserted that right to life by no implication be stretched to include right to die as it may lead to social disorder. If sec. 309 be declared as ultra vires, punitive actions cannot be taken against those adopting the practice of attempting to commit suicide with the plea that they have right to do so. It is true that in most of such cases the victims attempt such acts due to heavy mental stress, for which instead of punishing, some reformatory actions be taken against them. The very essence of sec. 309 also doesn't mandate for punishment in every case, rather it only sets the higher limit of such punishment. The courts are endowed with enormous power to ensure that unnecessary harsh dealing or injustice is not caused to the victims who are under severe mental stress.⁹

Conclusion

Attempt to commit suicide from an offence to

no offence to an offence and now in verge of again happening to be a No Offence. However, declaration of unconstitutionality to sec. 309 IPC would adversely affect the continuance of the provision under sec. 306. Ours is a male dominated society, women in some areas being still illiterate and bound by blind traditions. They very often fall victims to the cruel and inhuman treatments by their male counterparts and in-laws. Under such circumstances if any woman commits suicide, the persons responsible for active assistance and inducement to commit suicide may leave scot-free. It is quite pertinent that a society being unresponsive to social causes have no right to punish the distressed. At the same time it is also not possible for the State to adopt the principle that those not able to lead a dignified life are allowed to depart it.

Perspective on the Immorality of Honor Killings – A Review Article

Sneha.S¹, Smriti Sarathi², P.Sampath Kumar³, Rajesh.R⁴, Jagdish Kamal Chander.U⁵

¹Senior Resident/Research Assistant, ³Professor and Head, Department of Forensic Medicine & Toxicology, ²Third Year MBBS Student, Sri Ramachandra Medical College & Research Institute, Porur, Chennai, ⁴Assistant Professor, Department of Forensic Medicine & Toxicology, Government Kilpauk Medical College, Chennai, ⁵Assistant Professor, Department of Forensic Medicine & Toxicology, Sri Ramachandra Medical College & Research Institute, Porur, Chennai

Abstract

The killing of a family member, when the offenders believe that the victim's activities have resulted in immense dishonor to the family or community is called honor killing or shame killing. The absence of systematic data collection in most countries has resulted in lack of clarity on the judicial approach and its consequences, with many of the killings being reported falsely as suicides or accidental deaths by the families. Honor killings are prevalent all over the world, with the majority of them happening in the Asian countries, closely followed by the Middle East and South Asia regions. This review article attempts to analyze the present legal status of honor killing in the country of India, predominantly in the southern states. The sensational killing of a Dalit youth, Gokulraj in 2015 found in the company of a girl belonging to the Gounder community at a temple in Tiruchengode, sent shock waves across the state. Another prominent case occurred in the state of Tamil Nadu, where the marriage of Ilavarasan – a Dalit youth from Dharmapuri to a Vanniyar girl from Sellangottai, evoked deep conflicts in 2013, that led to the former's body lying on a railway track. With the ideals of 'honor' and 'disgrace' being deeply rooted in the Indian mindset, the laws alone will not suffice to curb such forms of violence and it has to be addressed as a sociological issue.

Key Words: Honor Killing, Khap Panchayat, Dalit, Vanniyar

Introduction

About The Crime

The killing of a family member, when the offenders believe that the victim's activities have resulted in immense dishonor to the family or community is called honor killing or shame killing. The reasons for this usually include events such as inter-caste marriages involving a caste hierarchy, refusing an arranged marriage, illicit relationships, separation from spouse, etc. These offences, are considered to be as misdeeds

or insults against the family, their traditions and social customs.

The victim's family members, most commonly men who believe they have been disgraced, are generally the perpetrators of honor violence. However in certain cases the men could also be victims of honor killings. Honor killings need not always be carried out by the family alone but may also be ordered by the community leaders or tribal councils.

The perpetrators justify the act on the basis that it was an act to uphold the honor of the family which was otherwise tainted by the behavior of the victim. It stems from strong religious and cultural principles that the perpetrators are taught by the elders in their family.

Although they bear a resemblance to domestic violence in terms of the most common perpetrator and victim, honor killings are culturally deep-seated. [1]

Global Scenario

The absence of systematic data collection in most countries has resulted in lack of clarity on the judicial approach and its consequences, with many of the killings being reported falsely as suicides or accidental deaths by the families. Honor killings are prevalent all over the world, with the majority of them happening in the Asian countries, closely followed by the Middle East and South Asia regions. According to an estimation done by the United Nations in the year 2000, an estimated 5,000 women are honor killed each year. [2]

Honor Killings In India

India is renowned for its high incidence of honor killings. The extent of the gruesome crime varies from state to state, with it being more common in the states of Punjab, Delhi, Rajasthan, and Bihar, largely due to the presence of 'Khap Panchayats' or 'Caste panchayats'. Tamil Nadu has become another epicenter of these crimes with increasing occurrence over the years.

Being a multicultural society, with variegated beliefs and faith forming the crux of every domain, honor crimes cut across all boundaries of caste, creed, class, religion, wealth and nationality.

Aim

To analyze the present legal status of honour killing in the country of India, predominantly in the southern states

Materials and Method

Primary sources – Cases in which post mortem was performed by the authors.

Secondary Sources – An extensive search was conducted from databases of valid studies to

explore the incidence, causes and approaches to honor crimes and a detailed analysis of the same has been made in order to reach conclusive results and emphasize on the necessity for a proper legal framework.

Causes and Method

There is no one specific cause for honor killing to occur and there are numerous, that interact with one another which include the following. Refusing an arranged marriage or marrying by own choice puts the family at the risk of "disgrace" such as in the case of a

21 year old girl in Delhi, who was strangled to death in November 2014, for an inter-caste marriage, by her parents, in whose eyes, the act had destroyed the family's prestige. [3]

1. Divorce: The woman is shamed for public display of her marital problems through attempting to obtain a divorce from her husband, especially when the marriage is arranged and involves dowry

2. Fear of Ostracization and isolation of a family by the society when allegations and rumors are set afloat about a female member.

3. Immodest dressing, which is beyond the norms of the society

4. Victim of Sexual offences: They are often considered impure and are believed to have brought upon dishonor to the family, especially if the victim gets pregnant. [4] Central to it is the misconception associated with the virginity of a woman where it is considered to be a property of her father gifted to her husband.

5. Heterosexual acts and non-sexual relationships out of marriage are perceived in the same light.

6. Homosexuality is another major factor thought to have brought dishonor to the family. This is considered to be more a crime when it is between two women. There is evidence to show that homosexuality is perceived to be ground for honor killing as seen with the killing of the Homosexual Turkish student Ahmet Yildiz in 2008.

Why Is Honor Killing Prevalent?

1. Patriarchal Society :

Every action of a woman is linked to the honour of her family which are hence controlled largely by the male members. Lack of respect for the choices and individuality of a woman is a contributory factor.

2. Caste System:

India is a country which is diverse not only in its culture but also in the number of castes that exists. The superior or inferior status of an individual is decided by the caste that one belongs to. Hence marrying someone outside of the caste is considered to be a big crime and a dishonour to the family. [5]

In connection with this there has been a Supreme court observation in the Latha Singh v. State of Uttar

Pradesh (2006) 5 SCC 475, which says that honor killings are basically cold blooded murder and that there is no honor in such acts. It also observed that in order to strengthen the social fabric, more of inter-caste and inter-religious marriages should be encouraged.

3. Khap Panchayats:

A community especially found in villages and in Northern India is the Khap Panchayats which is seen to exert a social influence within the community. These people take law in their own hands and mollycoddle in activities that are not only offensive, but that, which could endanger the personal lives of persons marrying according to their free will.

Courts have provided a number of judicial decisions against the wrong doings of the Khap Panchayats. One such decision was provided in the landmark case of Smt Laxmi Kachhwaha v. the State of Rajasthan (1999). A Public Interest Litigation was filed against the illegal functioning of Khap Panchayat in the Rajasthan High Court citing the reason to be violation of an individual's basic rights. The Court ordered State authorities to restrict the functioning of such Panchayat and also see to it that members of the said Panchayat be arrested and punished. In another case of Arumugam Servai v. State of Tamil Nadu (2011), the Apex Court was of the opinion that once a person becomes a major, it is his/her will to decide about the person they want to marry.^[6]

4. Inadequate education and lack of awareness leading to lack of sensitisation against the problem

5. Absence of stringent enforcement of laws :

Despite the increasing incidence and public outrages over the crimes, there exists no legal recognition, no protection offered to self-choice couples, no measures for the prevention and control of such barbaric acts and no punishment. Currently the crime is only reported as – Murder (section 302 of Indian Penal Code) and Culpable Homicide (Section 304 IPC). In 2015 there were 251 honour killing cases registered in the country a huge increase from what it was in 2014 of 28 cases.^[7]

LEGAL ASPECTS:

EFFECT ON CONSTITUTIONAL PROVISIONS:

This heinous crime is known to violate multiple provisions of the Constitution and basic human rights. Rights that are violated included those under Article

14(Right to Equality), Article 15(1) and (3) (prohibition of discrimination on grounds of religion, race, caste, sex or place of birth), Article 17(Abolition of Untouchability), Article 19(1) (freedom to speech and expression) and Article 21(right to life and personal liberty).

Considering Article 39(a) of The Directive Principle of State Policy (DPSP) , which makes it imperative for the State to secure the livelihood of all citizens, honor killings seem to deprive the victims of their very lives. Many young couples are put in a dangerous environment and exploited of their lives.

Legislations:

1. Indian Majority Act, 1859: According to by Article 21 -Right to marry is a constitutional right. A person, who is the citizen of India attains age of majority after completion of 18 years under Section 3 of Indian Majority Act, 1857. Once majority is attained the individual can decide to marry the person of their choice. The laws do not prohibit inter- caste, inter-community or inter-religious marriages which are common triggers for honor crimes.^[8]

2. Special Marriage Act, 1954: According to this act, any citizen of India including those living outside of India can marry irrespective of religion, caste or faith of the parties. The act aims to provide a special form of marriage for this purpose.

3. Protection of Human Rights (Amendment) Act, 2006: This act guarantees access to legitimate legal and fundamental rights.

4. Domestic Violence Act, 2005: Preventing a woman from marrying a person of her choice amounts to emotional abuse.^[9]

5. **The scheduled castes and scheduled tribes (Prevention of Atrocities) Act, 1989** - Most honor killings occur in relation to the Scheduled castes as they are considered to be one of the lower most castes in the hierarchy of castes. Any dishonorable acts against individuals of these castes are punishable under this act.

International Laws and their Applications:

Honor killing is prevalent not only in India but also places outside of it. The crime encroaches upon the Universal Declaration of Human Rights, 1948.^[10] According to the Article 1 & 2 of the Convention, “all human beings are born free and equal in dignity and

rights.” Article 3 states that” everyone has right to life, liberty and security”. Article 16 of the declaration gives all individuals who have attained majority , the freedom to choose the person to marry without any restraint due to religion, race or nationality.^[11]

India, being a signatory to the United Nations Convention on Elimination of all forms of Discrimination against Women (CEDAW 1979), is legally bound to enact policies and laws to alleviate all forms of honor killings and abolish gender based violence on women.^[12]

Judicial Approach

The approach to meeting out justice in the case of honor crimes has undergone a gradual change as reflected by the judgements and judicial trends with punishments being targeted at violation of the Constitution.

The Karnal District Court meted out justice to the deceased victims of the cruel act, Manoj and Babli, that eloped and married in June 2007. Five perpetrators were executed and the Local “Khap” (Caste based Council) head was given a life sentence.^[13]

The Supreme Court, in yet another judgement, described honor killings as threats or acts of harassment that are wholly illegal and attract severe punishment. The Division Bench expressed its concern over the consequences of inter-caste marriages, in the famous *Lata Singh vs State of U.P. and Anr* case, wherein it stated that

“Once a person becomes a major he or she can marry whosoever he/she likes. If the parents of the boy or girl do not approve of such inter-caste or inter-religious marriage the maximum they can do is that they can cut off social relations with the son or the daughter, but they cannot give threats or commit or instigate acts of violence and cannot harass the person who undergoes such inter-caste or inter-religious marriage.”^[14]

A parallel can be drawn to the case of *Jyoti Alias Jannat and Anr vs State of UP and others*, where the importance of the Indian Majority Act was reinstated.^[15]

The sensational killing of a Dalit youth, Gokulraj found in the company of a girl belonging to the Gounder community at a temple in Tiruchengode , by the President of the Dheeran Chinnamalai Peravai, a Kongu- Vellalar

caste-based outfit in 2015 sent shock waves across the state when Tiruchengode DSP Vishnupriya was found dead. Post mortem examination of the victim by one of the authors of this article revealed that the possibility of a homicide could not be ruled out.

Another prominent case occurred in the state of Tamil Nadu, where the marriage of Ilavarasan – a Dalit youth from Dharmapuri to a Vanniyar girl from Sellangottai, evoked deep conflicts in 2013, that led to the former’s body lying on a railway track. Though an author of this article who performed autopsy in this case gave evidence for a homicide, it is still undergoing a series of trials.

Conclusion

The alleviation of social evils such as honor killings is a multi-step process requiring equal gender relations to be established. A state’s asset is its citizens and safeguarding the same by preventing the violation of human rights, offering them protection and the necessary opportunities for the oppressed to seek support and aid, is hence its prime responsibility.

An efficient legal framework, stringent actions and effective enforcement alone cannot accomplish the task. Instead, every realm– social, economic, cultural and political will have to be sensitized to the ill-effects of the gory act to tackle the problem at hand by analyzing from all angles.

With the ideals of ‘honor’ and ‘disgrace’ being deeply rooted in the Indian mindset, the laws alone will not suffice to curb such forms of violence and it has to be addressed as a sociological issue.

The CEDAW convention believes in enforcing stringent laws against such heinous crimes. Due to certain loopholes in the law, some perpetrators escape even though most of them are punished.

Recommendations:

1. Systematic data collection
2. Improving service provisions for men due to the neglect of male victims.
3. Stringent laws with an effective framework should be enforced immediately deal exclusively with honor killings.
4. Change has to be brought in the mind set of

the people and for this awareness should be created. Stress should be given on the fact that honor killing is a punishable offence and those committing it should be punished severely.

5. Propaganda about the caste systems should be reduced

6. Khap panchayats should be abolished completely as they do not have any legal recognition

7. Education plays a pivotal role in preventing deaths caused by a lack of awareness amongst people belonging to the poorer socio-economic strata.

International Humanitarian Approach on ‘Identity Crisis’ of LGBTQ: A Global Perspective

Amruta Das¹, Amrita Mishra¹

¹Assistant Professor, Faculty of Legal Studies, Shiksha ‘O’ Anusandhan University, Bhubaneswar, Odisha, India,

Abstract

Unlawful attacks on sexuality perpetuated by intolerance of the binary sex poses a serious concern on the honour and reputation of a transgender person being an ‘individual’ making the minority vulnerable with poor physical and mental health. Being a person with diverse sexual expression is no limitation to enjoy basic inalienable rights being a ‘human’ suppressing sexual orientation and identity is an arbitrary denial of right to love with dignity. Streets taking up ‘pride parade’ movements confronting the Governments demanding progressive laws against discrimination, harassment and degrading treatment, recognition of their constitutional fundamental and basic human rights still remain far from reality. International commitments drafted at Conventions remain non-functional because most of the legal systems defend a stigmatised religious attitude and intolerance of culture. However, regardless of variation in customs, culture or societal norm, it is obligated on countries to secure freedom of expression of LGBTQ for an inclusive society. Homosexualities in sports and athletes have shown apologetic and disheartening incidents of voyeurism, trauma and humiliation. The alleged sex controversy of 2012 involving the Asian Games gold winner Pinki Pramanik (Indian Athlete) raised disturbing questions on a person’s anatomical features, right to privacy of body, standards of morality when she was mistreated and lodged in a male prison on accusations of raping her live-in-partner. This paper is an attempt to bring out the perspective of world community on personhood and human rights of the LGBTQ/transgender community.

Key Words: LGBTQ, Identity, Equality, Gender, Discrimination.

Introduction

Over the centuries they have endured cruel forms of physical assault, forced prostitution, hate crimes even honour killings. The prevailing social-political scenario and existing legal framework appear to be indifferent and negligent to the agony of the community who for no fault of their own suffer grave injustice at the hands of its fellow beings and the State. Thus, the paper intends to offer an insight into the state of affairs of the Government, the Judiciary in working out a humane approach towards the LGBTQ community or ‘third gender’ and looks ahead with some suggestions that will hopefully ensure equity and justice in true sense. United

Nations Declaration on Human Rights (1948) has put an umbrella cover against all form of discrimination under Article 2, wherein, every individual has been granted rights and freedoms set forth in the UN’s Declaration irrespective of any distinction of any kind. While Article 1 safeguards for all an equality before the law and equal protection of the law, Article 12 protects right to privacy from arbitrary interference, any target upon honour and reputation of individuals. The Committee on the Rights of the Child (CRC), too stress that discrimination against vulnerable or marginalized groups of children (including children who are lesbian, gay, transgender or transsexual) must be addressed by the States parties.

Socio-Legal Perspective: Degrading treatment towards LGBTQ is often coupled with other parameters of superiority norms e.g. race, religion, disability, or economic, social or other status. Trans people across different countries face complex human rights issues often questioning their ‘gender identity’ unlike the self

Corresponding Author:

Amruta Das

Assistant Professor, Faculty of Legal Studies, Shiksha ‘O’ Anusandhan University, Bhubaneswar- 751003, Odisha, India, Email-Id: amrutadas@soa.ac.in, Mob: 9437767070.

acclaimed superior genders of ‘male’ and ‘female’ who are perceived normal and without any chromosomal deficiency or discomfort in biological body. Apart from the instances of abuse, ostracization, and hate crimes, the following concerns need to be empathetically addressed across the globe under domestic laws and welfare policy measures justifying standard norm of ‘equality’ and ‘freedom’ meaningful irrespective of gender in whatsoever diversity ;

1. Invasion on right to privacy
2. Criminalisation of homosexuality
3. Restricted access to health services
4. Limited access to public places and institutions
5. Exclusion from employment and livelihood opportunities
6. Forced labour, slavery and sexual exploitation
7. Discriminatory treatment in access to education
8. Freedom of free speech, assembly and association
9. Citizenship rights and freedom to participate in all civic body elections
10. Legalising right to marriage, parenthood, adoption

International Scenario: Though the countries have ratified commitments under the International law to safeguard individuals from cruel inhuman and degrading treatment, they have failed to realise the same. However, the last few decades have seen some visible movements, protests by the LGBTQ community leading to formal, intergovernmental meetings at the United Nations and other fora, demanding right to self identity, a life of dignity and mainstreaming into the society. At this juncture, the Yogyakarta Principles of 2006 comes as relief to ensure that States ensure and implement the obligations ratified under various International covenants, treaties or protocols. Keeping in view the growing concern on raising violations of human rights on account of orientation and identity, the Yogyakarta Principles plus 10 (adopted on 10 November 2017) to complement the Yogyakarta Principle on additional provisions of State

in respect of application of the International Human Rights Laws as to Gender Expression, Gender Identity, Sex Characteristic and Sexual Orientation.²

The International Covenant as to the Civil and Political Rights, 1966 has a vital responsibility of upholding and protecting the human rights of people without any discrimination. Various provisions relevant to the mandate of such protection include Article 2(1) which emphasizes on the State parties to ensure to all individuals irrespective of distinction of any kind all the rights recognized by the Covenant. Article 26 on the other hand emphasizes on ‘equality before law’ thereby entitling every person protection of law without any discrimination.³

Rights of Transgender: A Global Context

Australia: The Australian Parliament passed same sex marriage laws in December 2017 with questions concerning adequate protection of ‘freedom’. Other legislation such as Family Law Act, Migration Act, Sex Discrimination Act etc. has to be amended so as to adapt the legislations consistent to the requirement of new law making the definition of ‘marriage’ which is being changed from a ‘union of man and woman’ to ‘union of two people’ in the Marriage Act, 1961.⁴

Bangladesh: The Human Rights Watch, a non-governmental human rights organisation has time and again asked the Bangladesh Government to develop legal mechanisms to better protect the human rights of the transgender, but in vain⁵. In 2017, few transgender persons from different parts of Bangladesh were interviewed by the Human Rights Watch and almost all of them allegedly spoke about being bullied at schools. They also expressed the difficulty in accessing health care, harassment in private and public places, barriers to employment etc. On the top of this, they were also attacked by religious extremist and targeted for their gender identity⁶.

Amidst all the issues faced by transgender in Bangladesh, though some small steps has been taken by the Government in the recent years, but declaration of legal recognition and policy implementation still remains a distant dream in Bangladesh with government rejecting

recommendation of the United Nations Human Rights Commission (UNHRC) to repeal the old draconian law forbidding same sex conduct.

China: Homosexuality was decriminalised in China way back in 1997 but same sex partnerships are yet to be recognised. Also, laws for protection of people from discrimination on basis of gender identity and sexual orientation are yet to be reformed. Moreover, the attitude of the Government towards homosexuality and transgender is quite paradoxical with instances of Chinese Authorities shutting down popular dating Application (App) for Lesbian online video programmes on abnormal sexual lifestyles. In addition to that, transgender communities are forced to cancel events and 'Speak Out' conferences. Also, instance of 'conversion therapy' continues in the country including electro shock therapy questioning the protection measures of the Government⁷.

Europe: The European Union was one of the first international organisations to recognise sexual orientations explicitly. The protection of LGBT was first included in the Amsterdam Treaty of 1997. In 2000, in the Charter for Fundamental Rights, the directive for Equal treatment (in respect of trade and job prospects) of LGBT community was established in order to protect against discrimination. Also, the EU has got protection for the UK citizens on same sex partnership or marriage (who have registered their partnership or married in UK) when they work, live and travel within the EU continue having their relationship recognised and all legal rights protection intact⁸.

In the year 2013, guidelines in supporting LGBT human rights were adopted by EU which is being used by the staff and embassy of the EU countries all over the world. Recently, in the year 2017, Council of Europe Secretary General T. Jagland highlighted the need of effective and strong anti-discrimination laws and following the same the ECtHR ruled that it is grave violation of human rights to force the transgender to undergo sterilisation operation to have their gender recognised. Later in March 2018 a resolution was passed by the European Parliament condemning the Conversion therapy and the EU member states were thereby urged to ban the practice⁹.

United States: The LGBT rights have significantly progressed over the period of time but the rights vary by

jurisdiction. In Mississippi, until April 2016 when the govt enacted laws for LGBT community, discrimination based on religious and moral bias as to same sex marriage and recognition of transgender identity was permitted. In Michigan, the State funded adoption and foster care agencies are at a liberty to refuse to place children with LGBT parents on grounds of moral and religious objections. In some States, due to their religious exemptions, LGBT people fear mistreatment in public places and from seeking services. Almost hundred Bills promoting LGBT rights were introduced by legislators in several States in 2017¹⁰.

Rights of Transgender in Indian Context:

Transgender constitute an integral part of every cultural diversity across the globe, subjected to similar prejudices owing to their sexuality and gender with denial of basic human rights and restrictive definitions of 'freedom' negating and affecting recognition, realization of rights on the same footing as secured under international law. They comprise a diversity including lesbian, gay, and bisexuals, cross dressers. In India, however, it has assumed distinct and separate class/category which may encompass various visible regional and trans-regional communities like hijras/kinnars, kothis, aravanis, jogtas, and shiv-shaktis¹¹. From guaranteeing right to dignified life (Article 21), securing primary right to 'freedom of expression' (Article 19), 'equality before law' (Article 14), safeguarding from discrimination on any ground be it race, caste, religion, sex and place of birth (Article 15) and equal opportunity of employment (Article 16) to protecting against human trafficking and forced labour (Article 23), the Constitution of India promises to gift a dignified way of life.

Dilemma of Identity: Gender identity and sexual orientation has been the key criteria for ascribing various rights under the NALSA judgement establishing identity with the gender is person's right to self-identification either as binary sex or transgender or other category where one's orientation indicates to individual's enduring physical attributes, or an emotional attraction towards other identities. The two-judge bench judgment though made assertive directives for the third gender and transgender, but the confusion over the word 'transgender' still hangs open for some vague interpretation. While, Justice Sikri, has given a restrictive definition to the term based on essentialist criteria,¹² Radhakrishnan J.

exhaustively interprets ‘transgender’ as an open ended umbrella clause embracing a variety of expressions and experiences including any surgically operative (pre or post) trans sexual people.

Dilemma of Special Status: India being a welfare State has made special provisions for its minority and marginalised groups considering their vulnerability, special condition and justifiable requirements (subject to criteria of ‘reasonable classification’) as permitted within the ambit of the Constitution. However, the newly coined status of ‘*socially and educationally backward classes*’ given to the transgender has raised some criticism. The question often raised is whether it is justified to categorise a minority community (transgender) within another minority class (SEBC) of citizens to give access to welfare measures under various schemes. Again there is a likelihood of confusion of associating the third gender under “Other Backward Classes” or the leaving wide ambiguous interpretations.

Though, the third directive under the NALSA judgement secures the transgender a status of ‘SEBC’ of citizens with all kinds of reservation(Quotas) in cases of admission in educational Institutions and public appointments, making Article 15(4) bring meaning to their long drawn plight in getting access to such public space.

The approach to categorise ‘TGs’ as a whole under SEBC replaces the axis of gender in the place of caste, however ignoring the fact that ‘minority community’ may span an array of class and caste positions. In the growing concerns and debate at State and national level on inclusion of third gender into a class based category or gender based reservation, the NALSA judgment is yet to yield some success in meaningful terms.

Conclusion

Transgender and people of LGBTQ community have been the worst victims of harassment and exploitation due to statelessness and no compartmentalised identity and also being deprived of access to basic education, employment opportunities within the society. Though safeguards are being made mandatory through national implementation of laws, very few objectives are being observed and realised in real sense. In India, while the ramifications and impact of landmark NALSA judgment are yet to stand the test of time in meeting the aspirations of minority community of ‘transgender’ against social stigma, existing binary laws and evolving legislations

seeking to protect their socio-economic rights, instances of societal rejection, marginalisation and discrimination seem to be on the rise.

Ethical Clearance: Not required as the researcher has just referred to some published works. The research is doctrinally undertaken, completely by the researchers themselves.

Direction of Environmental Virtue an Epilogue: A Critical Analysis of 19th Century Case Laws

Annapurna Pattnaik

Asst. Prof. in Law, SNIL, SOA University

Abstract

In this race the Indian legislature, fortunately, has not lagged far behind and has shown great concern for degradation of environment” and made specific legislative attempts to control different environmental pollution in particular. On the other hand, the second limb of the state, the executive, has been moving at a snail’s pace or what Justice Krishna Iyer says, the bureaucratic machinery, which difunctionally, has passion for files, not for the people.” Whereas, the judiciary is trying its best to balance the environment and development. In view of the degrading environment which poses a problem for the very survival of living things, the environmental law academics lately started paying attention to this underdeveloped field. Out of the three components of the state, the academics in India have generally confined their discussions to the approach of the legislature. The executive approach in environment has yet to attract serious attention of the law academics’ writings. However, the judicial approach finds some place in the law writings. The present paper makes an attempt to take further the discussion on Indian judicial approach in the field of environment. Such academic exercise is all the more necessary in the present time because Indian judiciary since 1980 is taking special cognizance of the pollution explosion and there is a substantial increase in the case law in environment. Is not the time ripe to take stock of the direction of environmental legality in India? The present paper makes a humble attempt in this direction. It confines discussion to the cases of 1987 decided by the Supreme Court of India and the High Courts. This specific year has been selected because the graph of case law in environment from the year 1950 to 1990 shows its highest peak in 1987.

Key Words: *environmental pollution, environmental degradation, balanced approach, environmental legality, industrial activities*

Introduction

The life of human beings depends upon the ecological balance and environmental protection. If the human beings protect the environment and promote the ecological development automatically an environment free from pollution may be developed and with that development of the living conditions of human beings and living organisms will be developed. The environmental damage will be caused not only in the nation where it occurs but at the global level in general. All public institutions, including the judiciary, need

to make collective effort to fight against this universal peril. Human activities sometimes tend to submerge concepts such as respect for nature, trusteeship of earth resources and community interests in common amenities, present in the traditions of many developing countries. These traditions can be a rich source of inspiration for the environmental law of the future, where relevant attention is drawn to them. Environmental problems stem from two main categories of human activities. First, the use of resources at unsustainable levels and contamination of the environment through pollution and secondly discharge of the wastes at levels beyond the capacity of the earth and environment to absorb them or render them harmless results in ecological damage and environmental degradation. Environmental damage around the world includes: biodiversity loss, pollution of water and consequent health problems, air pollution resulting increase in respiratory diseases, causing

deterioration of buildings and monuments, loss of soil fertility, desertification, increase in skin cancers and eye diseases in certain areas due to ozone depletion, and more widespread diseases. Environmental hazards are created by the excess consumption propensities of rich people, while the weight of environmental degradation is primarily borne by the poor people.

The year 1987 saw many judgments handed down by the Supreme Court of India while few cases were decided by the High Courts.¹³As regards the Supreme Court cases, many cases were decided by the Division Bench consisting of two judges and some cases by three judges. All the judgments were unanimous except the Sachidanand Pandey case where Justice Khalid, “fully agreeing” with the conclusion of Chinnappa Reddy “added few lines” to “delineate the parameters of public interest litigation.” And also, in the M.C. Mehta case, Justice K.N. Singh, “agreeing with every word” of Venkataramiah J. “added few words.” In the above two cases the individual judges, delivering separate opinions, did not deviate from the unanimous approach. Justice Ranganath Misra participated in the maximum number of environmental law cases followed by Justices P.N. Bhagwati and G. L. Oza. It was Justice Misra who wrote the maximum number of judgments. In the cases of 1987 during the Chief Justiceship of Justice Bhagwati, one finds that the Bench had invariably at least one judge who was already there deciding environmental law matters. As regards the High Court case law, the environmental law matter was handled mainly by three High Courts: Allahabad, Andhra Pradesh and Karnataka. The judgment of the Allahabad High Court was a decision of the Division Bench consisting of two judges, whereas, in the other cases it was a single judge opinion. But the Damodar Rao case makes history in the field of environmental law where Justice Choudary, under the influence of Maneka Gandhi’s wavelength tried to bring right to the enjoyment of a pollution free life under Article 21 of the Indian Constitution.

Now coming to the subject matter, the question of balancing ecology attracted maximum litigation. In most of the cases the petitioners pleaded for protection of environment. The pollutants which attracted the most attention included, industrial activities, mining technology, deforestation and building construction, with industrial pollution alone attracting ten case law. In this paper some cases the government or other authorities were defendants and in other cases the writ

petitions were filed against private parties. It is very clear in such cases that administration of environmental justice received a sympathetic consideration when the legal battle was fought by the social organization or social activist.

There are criticisms against the administration of environmental justice. An attempt is made in the present paper to find out how far it is true to label the Indian judiciary as not possessing the pool of skills, the fund of experience or being “not innovative and ill-equipped to deal with complex legal issues,”¹⁴The present study also examines different dimensions of environmental justice in India.

Industrial activities

The most dangerous pollutions caused by industry include air, water and noise. The problem of gradual deterioration in the environment of the present case law industries which attracted litigation included fertilizer, slaughterhouse and mining activities. In many cases, the Supreme Court adopted a balanced approach and allowed industrial activities to continue with Certain riders. It is interesting to note that the balanced approach orders or judgments were delivered by judges like Bhagwati, Ranganath Misra and Oza JJ. who were mostly on more than one Bench handling environmental cases. But this should not be taken to indicate that these judges learned in favour of balancing the competing interests.

Food and fertilizer industry

The multi-dimensional issues relating to environmental pollution were raised in M.C. Mehta v. Union of India, A.I.R. 1987 S.C. 965 case where the sole question was whether Shriram should be allowed to restart the caustic chlorine plant. The flashback of this case was that, there was a major leakage of oleum gas from one of the units of Sriram affecting a large number of persons, both amongst workmen and public, and it was alleged that an advocate practicing at the Tis Hazari Court died due to the leakage and within two days there was another minor oleum gas leakage. In view of these incidents, the inspector and assistant commissioner of factories issued orders prohibiting Sriram from operating their plants.

The aftermath of the Bhopal tragedy, opened the eyes of the Government of India and it started examining the question whether industries employing hazardous

technology and producing dangerous commodities, were equipped with proper and people living around them. There were committees after committees of accidental release of hazardous gas could endanger life of the people living in the vicinity of the caustic chlorine plant. Further, they were all unanimous that there was considerable negligence on the part of the management of Sriram in the maintenance and operation of the said plant.

The Supreme Court in this case was confronted with the problem of how to balance the pollution hazard of the chlorine gas over the (i) safety arrangements made by Sriram, (ii) interests of workmen, (iii) scarcity of chlorine, and also (iv) a task and with considerable hesitation, bordering almost on trepidation. While balancing development and environment, it tilted the scale in favour of development. It further stated that such an approach was essential for economic development and advancement of well-being of the people.

Some of the “stringent conditions” which the court imposed so as, “to almost reduce to nil” the hazard or risk, included:

First, the installation of effluent treatment plants.

Second, operator of the safety device and head of the chlorine plant would be held personally responsible if the expert committee or factory inspector found that the safety measures were not properly functioning.

Third, chief inspector of the factory or any senior inspector nominated by him or deputed by the Central Board would inspect the caustic chlorine plant at least once a week by paying a surprise visit

Fourth, the Chairman and Managing Director of the Delhi Cloth Mills Ltd., which was the owner of various units of Sriram, would give an undertaking that they would be held personally responsible for payment of compensation for any death or injury. It may be mentioned that section 16(1) and (2) of the Environment (Protection) Act 1986 specifically imposes personal responsibility on the above officers of the company. In view of the statutory strict liability the undertaking had no meaning.

Fifth, the condition provided that there would be a Committee of Workmen’s Union to look after the safety arrangements in the caustic chlorine plant.

Sixth, there were also conditions for protection of the workmen including training of workers in regard to functioning of the plant, warning and safety devices. The introduction of environmental education is one of the basic needs for protection and improvement of the environment.

Finally, Sriram was required to deposit Rs. 20 lakhs and bank guarantee for Rs. 15 lakhs had to be furnished within two weeks from the date of the present judgment for payment of compensation claims of the victims of oleum gas.

Slaughterhouse

An abattoir, having its plant in the agricultural area, was not permitted to further run its business. It was alleged that the abattoir was likely to pollute the rivet water used by human beings and animals and in no circumstances should it be permitted to run the plant. The Supreme Court¹⁵ upheld the order of cancellation of permission in the public interest. In this case, unfortunately, no light is thrown on the ecological problem, whereas the aspects of environmental problem involved were, first use of agricultural land for non-agricultural purposes; and second, pollution which could be caused by a large meat export industry.

Mining activities

Mining activity is a source of environmental pollution. In Rural Litigation and Entitlement Kendra,¹⁶ the main question before the Supreme Court was whether the mine lessees could be allowed to mine quarrying operations. The court was confronted with the difficult task either to protect the ecology and environment or to make available to the country, high grade lime stone deposits. The court in the present case shifted its responsibility and preferred a decision by the bureaucrats over the judicial finding.

At the same time, the court insisted that the natural resources have got to be tapped for the purpose of social development but this should be done with requisite attention and care so that ecology and environment was not affected in any serious way. Use of the word ‘serious’ in this judgment implied the court’s inclination towards the development process. Further, how far the government will seriously balance the competing

interests is a doubtful question.¹⁷

Direction of environmental justice an epilogue

The Judiciary maintained a distinction between an established industry and an industry to be established. To prevent the environmental pollution, the judiciary turned down the rigid control mechanism on the industrial process. The private industries at times did not give cooperation to the judiciary in observing the minimum standards. In such cases the court came down with iron hands to that the inactive capitalists could be forced to rise to the occasion and fulfil their constitutional duty relating to environment.

Whatever was the wavelength in balancing environmental justice in the present case law, one bright side was that the case law brought to light the pollutants and polluters who would have otherwise remained in the dark. And here comes the need of social action organisations to publicize their anti-pollution role so that a mass movement could be developed against those who commit offences not just against the present generation, but the generations to come.

Conclusion

The environment cases of 1987 saw new directions of environmental education, protection of public and workers' health and the economics of pollution. The discussions of fundamental right, fundamental duty and the directive principles relating to environment had also some place in a few cases. The important judicial innovation in this field was recognition of the fundamental right to live in a clean environment, which has yet to find a place in other environmental jurisprudence. This development imposes a constitutional duty on the state and other authorities to provide all the people of India a loveable environment.

The environmental justice is a developing branch where Indian judiciary has made new innovations in the administration of justice. These include, for example, the forging of new remedies, principle of absolute liability, Indian jurisprudence of judicial process, foregoing the hyper-technicalities, speedy and cheap environmental justice, adjusting the scale of justice with changing time and situation, environment court, neutral environment experts, pollution insurance, etc. At times, the Indian judiciary, while administering environmental justice, laced difficulty in balancing the environment and

development, but it did not shirk its responsibility. The court tried its best to see that, on the one hand the environment was least interfered with, and on the other, the development process for a developing country, like India, was permitted within a reasonable dimension. In view of the above developments and innovations, in the Indian environmental jurisprudence, the environmental justice is still in a nascent stage and this tender plant has yet to reach deep into the Indian soil. So, our Indian judiciary is "very progressive" and "super-innovative".

A Study on Pattern of Intracranial Injuries in Cases of Fatal Head Injury

Arulmathikannan M¹, Jagdish Kamal Chander U.², Priyadarshee Pradhan³, Sneha.S⁴, P. Sampath Kumar⁵

¹PG Student (MD), ²Assistant Professor, ³Professor, ⁴Senior Resident (ICMR Research Scholar), ⁵Professor and HOD, Department of Forensic Medicine & Toxicology, Sri Ramachandra Medical College & R.I, Porur, Chennai

Abstract

Head injuries are the most common cause of death in trauma patients throughout the world. These injuries occur due to many causes most common of them being road traffic accidents, followed by fall, assault, etc. The dissection technique of scalp, skull and dura was in accordance with the procedures suggested by Gresham GA and Turner AF and the brain dissection as suggested by Ludwig J. Among the 42 cases, highest number of cases was between the age of 51-60 years with 12 cases (28.6%) and the lowest < 20 years with 4 cases (9.5%). The highest number of cases were seen among the upper middle class with 19(45.2%). There were 30 (71.4%) cases of road traffic accidents and the remaining 12 (28.6%) were case of fall (fall from height, fall of objects etc). Among the cases with skull fracture 23.8% (10) had linear fractures, 11.9% (5) had comminuted fracture, 2.4% (1) had diastatic fracture and others (61.9%) had no fractures. Among the cases with skull fracture 23.8% (10) had linear fractures, 11.9% (5) had comminuted fracture, 2.4% (1) had diastatic fracture and others (61.9%) had no fractures. Subdural hemorrhage was the commonest (n=34) intracranial injury observed. Highest number of fractures were present in the middle cranial fossa (n=16) among them 11 was linear fractures and 5 were comminuted fractures.

Key Words: head injury, road traffic accident, fall, fractures, parenchymal injuries.

Introduction

Among all regional injuries, injuries to the head and neck are the most common and important in Forensic Medicine. ^[1] Head injuries are the most common cause of death in trauma patients throughout the world. As the head accommodates the most vital organ of our body 'brain', so such injuries cause death of victim in most of cases due to brain damage. ^[2] These injuries occur due to many causes most common of them being road traffic accidents, followed by fall, assault, etc. Road traffic injuries are the leading cause (60%) of fatal head injuries followed by fall from height (20%-25%) and violence (10%). Road traffic accidents are a human tragedy. Road traffic accidents take major portion of magnitude of

mortality in developing and developed countries, also the major concern of disability and pose itself as a major epidemiological and legal problem universally. However the other causes viz. fall from height, assault etc. also adds up to the toll. The extent of injuries sustained vary depending on the falling height, the composition of the impact surface, rate of deceleration, intermediate objects encountered during the process of fall, the position of the body when landing and individual factors such as age, body weight, pre-existing disease, and type of the person (child, adult, elderly). In India, fall from height is one of the common causes of severe blunt trauma. Fall from high places are frequently encountered in accidents, suicides & sometimes rarely in homicides. ^[2]

Aims and Objectives

To ascertain pattern of head injury due to varying etiology

Materials and Method

This cross-sectional study was conducted at the

Department of Forensic Medicine and Toxicology of Sri Ramachandra Medical College and Research Institute, Porur, Chennai between June 2017 and May 2018. The sample size was 42 that were found eligible and taken up however the cases with advanced stage of decomposition where interpretation of injuries were not possible were excluded from the study.

The dissection of scalp, skull and dura matter was done after which the brain dissection was done. The brain was subjected for 1cm thick coronal sections. Each slice was examined before the new slice was made. The brain-stem and cerebellum were sectioned in a horizontal plane.

The demographic data as regards to age, sex, socio economic status (based on modified Kuppusamy classification), manner of injury, and Post mortem findings with respect to Skull fractures types and sites, brain parenchymal injuries.

Data collected were analyzed using Statistical Package for Social Sciences version 15.0 software. The output of the Data was in frequencies and percentage. Then Charts and Tables were prepared based on the output data.

Results

Among the 42 cases, highest number of cases was between the age of 51-60 years with 12 cases (28.6%) and the lowest < 20 years with 4 cases (9.5%). The youngest victim was 18yrs old and the oldest was 80 years of age. On adding up total of 19 cases (45.3%) were present in the productive age group between 20yrs-50yrs (Ref Table 1). Mean age is 45.45years. In the study there were 39 (92.9%) male cases enlisted and female were 3 (7.1%) (Chart – 1).

The socio-economic status of the total cases were classified based on modified Kuppusamy classification with data collected on education, occupation and monthly income of a person. Based on this the highest number of cases were seen among the upper middle class with 19(45.2%) and the least was among the upper 1 (2.4%) and lower 1 (2.4%) economic category. Two cases were left behind as, one was a student and the other was a old female with no necessary credentials required (Chart – 2).

As per the history obtained from the relatives and through the Police Inquest, out of the total 42 cases,

there were 30 (71.4%) cases of road traffic accidents and the remaining 12 (28.6%) were case of fall (fall from height, fall of objects etc) (Table – 2).

Among the cases with skull fracture 23.8% (10) had linear fractures, 11.9% (5) had comminuted fracture, 2.4% (1) had diastatic fracture and others (61.9%) had no fractures (Chart – 3). Subdural hemorrhage was the commonest (n=34) intracranial injury observed among the total 42 cases of fatal head injuries next with subarachnoid hemorrhage in 28 cases closely followed by subscalpal hematoma in 28 cases, Ventricular hemorrhages were present in 9 cases, contusions present in 7 cases and epidural hemorrhage was elicited in 6 cases (Table – 3). Highest number of fractures were present in the middle cranial fossa (n=16) among them 11 was linear fractures and 5 were comminuted fractures, Posterior cranial fossa had 10 fractures of which linear and comminuted fractures were equally observed and 6 fractures were present in the anterior cranial fossa were linear and comminuted fractures are equal in number (Chart – 4).

Table 1: Age Distribution

Age (range)	Frequency (n)	Percent (%)
<20yrs	4	9.5
21-30yrs	6	14.3
31-40yrs	6	14.3
41-50yrs	7	16.7
51-60yrs	12	28.6
>60yrs	7	16.7
Total	42	100.0

Table 2 : Incidence

Type	Frequency (n)	Percent (%)
RTA	30	71.4
FALL	12	28.6
Total	42	100.0

Table 3: Types of Injury / hemorrhage in head injury

Types of Injury / Hemorrhage	No.of cases
Sub-Scalpal Hematoma	28
Epidural Hemorrhage	6
Sub-Dural Hemorrhage	34
Sub-Arachnoid Hemorrhage	29
Ventricular Hemorrhage	9
Contusion	7

Chart 1 : Gender Distribution

Chart 2: Socio Economic Status (modified Kuppusamy classification)

Chart 3 : Incidence of skull fractures

Chart 4 : Pattern of Base of Skull Fractures

Discussion

A total of 42 cases were taken up, for the study in which the highest incidence of fatal head injury cases was observed in the age groups 51-60years followed by the group between 41-50years and the mean age of the subjects was 45.45years. Dr. Priyadarshi et al’s study on pattern of fatal RTA found the vulnerable age group of fatal head injuries were among those in 40-59 yrs (54.3%) [3] which is the most productive age group in the community.

The data show male victims were more common than the female is in coherence to study by Selvaraj.T et al, in the southern city of Madurai in Tamilnadu with 84.9% of male and 15.1% of female victims of road traffic accidents. [4] Arvind Kumar et.al study was with highest male victims (88.22%) in his study on relating the fatal road traffic accidents and head injury. [5] The finding of the study that majority of victims of head injury fell in the category of upper middle class as per Modified Kupussamy classification of Socio-Economic Status, is almost referring the study by Dr. Priyadarshi et.al where the middle category (20%) was the highest involved group in fatal road traffic accidents followed by the upper middle category. [3]

The incidence of road traffic accident (71.4%) followed with fall (28.6) were found in study is similar to the observation of Prasanthi Puvanachandra in Asia in which majority of cases of traumatic brain injuries were of road traffic accidents (60%) followed by fall (20-30%) and the least violence (10%) [6], another study by Dr. Mukesh Kr Goyal et.al also shows similarity with cases of road traffic accidents (62.1%) followed by fall (30.7%) [7].

Linear fracture composed of 23.8% of the skull

fractures and next was the comminuted fracture. In a study on head injury by blunt force by Raja Rupani et al, fissure/diastatic fracture was seen in 50% followed by 30% of depressed fracture and 20% comminuted fracture^[10] showing a wide difference in the results. Manish K et al observes that a linear fracture (38.8%) was the commonest among the victims of road traffic accidents.^[9]

As found in the study it was the subdural hemorrhage predominating among all types of intracranial injuries followed by subarachnoid hemorrhage. These results were in coherence with the 5 years (2008-2012) retrospective study by Shivaramu MG et al; states that subdural hemorrhage (130) was the commonest intracranial injury, followed by Sub-Arachnoid hemorrhage (126) among a total of 310 fatal cases of road traffic accidents.^[10] Yet another similar study by Anand Menon et al also state that Sub-Dural hemorrhage was present among 52.63% of cases, followed by 27.27% cases with subarachnoid hemorrhage.^[11] Study of Arvind Kumar et al also gives subdural hemorrhage (89.11 %) as the commonest of the intracranial hemorrhages.^[7]

A Post-mortem Observational Study of Suspicious Deaths in Married Females Aged 30 Years or Less

J. P. Kachhadia¹, J. A. Tanna², V. R. Patil³

¹Tutor, Govt. Medical college, Baroda, ²Assistant Professor, GMERS Medical college, Junagadh,

³Professor & Head, Govt. Medical College, Baroda

Abstract

Introduction – Suspicious death in married female is always a sensitive case and needs our full attention. So, current study was undertaken at S.S.G. Hospital, Vadodara for a period of 1 year.

Material & Method –Of all cases coming for the postmortem examination, cases in which the victim is female and below 30 years of age were taken for the study when there was suspicion regarding the cause of death.

Results – Out of all the medico-legal autopsies 5.7 % autopsies were Unnatural deaths of married females less than 30 years old. Maximum number (40 %) of deaths were observed in the age group of 21-25 years. (86.65 %) of female deaths occurred within 0-7 years of marriage. 75.55 % of deaths were suicidal in nature followed by accidental (18.88 %).

Statistical Analysis –The data collected was analyzed using MS Excel worksheets for averages and percentage.

Conclusion – Many of the findings of current study were correlated with earlier studies, while others were found contradictory. Further detailed study with larger sample size is required.

Key-words –*Suspicious death, married female*

Introduction

In an autopsy whenever there is a case of married female for post-mortem examination, there is always suspicion raised by the family of the female. So, in every case of married female death we have to be extra cautious. And also, the chance of maternal death also should be kept in mind in married females. So, to identify profiles and patterns in suspicious deaths in married females, current study was designed. The current study was undertaken at P.M. room of S.S.G. Hospital, Vadodara

to study the profiles and patterns in suspicious deaths in married females of below 30 years age group. Out of total cases coming from post-mortem examination total 90 cases were selected based on inclusion, exclusion criteria.

Material & Method

An autopsy study of suspicious deaths in married females of below 30 years age was carried out in this Medical College from 1st August 2017 to 31st July 2018. A total 90 autopsy cases of unnatural deaths in married females with age less than 30 years were studied during the study period.

Inclusion Criteria:

The material for the present study consists of the cases of suspicious deaths of married female with age less than 30 years which have been brought for medico-legal autopsy.

Corresponding Author :

Dr. Jitendra A. Tanna

Assistant Professor,

Forensic Medicine Dept,

GMERS Medical College, Junagadh

E-mail – jitu_tanna1@yahoo.com

Exclusion Criteria:

1. Deaths due to mass casualties or road traffic accidents.
2. Deaths due to natural disease.
3. Unidentified and Decomposed female dead bodies.

Before performing autopsy, all these cases were studied in details from indoor case records, hospital records (where applicable), history obtained from relatives of deceased and police inquest. A standard proforma was used to collect information regarding age of deceased, duration since marriage, educational background of deceased and husband and types of

family. A careful and complete autopsy was performed in each case. The viscera and necessary samples were preserved in required cases. Statistical analysis of data was done and presented as result and observation in tabular form, graphs and charts.

Statistical Method

The data so collected was tabulated and required calculations were done using MS Excel 2010. No other statistical method was required.

Results

Out of total 1925 autopsies performed in 1-year study period, 90 cases were selected as per inclusion, exclusion criteria. The results are as per tables below.

Table No.1: Distribution of cases according to age.

No.	Age of Deceased	No. of Cases	Percentage
1.	Less or equal to 20	24	26.67 %
2.	21-25 years	36	40.00 %
3.	26-30 years	30	33.33 %
Total		90	100 %

Maximum number (40 %) of deaths were observed in the age group of 21-25 years followed by 26-30 years (33.33 %).

Table No.2: Distribution of cases according to religion

Sr. No.	Religion of Deceased	No. of Cases	Percentage
1.	Hindu	83	92.22 %
2.	Muslim	4	4.44 %
3.	Sikh	3	3.33 %
4.	Other	0	0 %
Total		90	100 %

Most of the deaths (92.22 %) were observed in Hindu religion followed by Muslims (4.44 %) followed by Sikh (3.33 %).

Table No.3: Distribution of cases according to duration of marriage

Sr. No.	Duration since Marriage	No. of Cases	Percentage	
1.	Below 1 year	20	22.22 %	86.65 %
2.	Between 1 to 3 years	33	36.66 %	
3.	Between 4 to 7 years	25	27.77 %	
4.	Above 7 years	12	13.35 %	
Total		90	100 %	

It was observed that significant number (86.65 %) of female deaths occurred within 0-7 years of marriage.

Table No. 4: Number of cases having children

No.	Deceased having children	No. of Cases	Percentage
1.	Yes	49	54.45 %
2.	No	41	45.55 %
Total			100 %

It was observed that 54.45 % of female victims had children while 45.55 % female victims had no child.

Table No. 5: Distribution of cases according to cause and manner of Death

No.	Cause of Death	Manner of death			No. of Cases
		Accidental	Suicidal	Homicidal	
1.	Burns & its complications	10 (11.11 %)	16 (17.77 %)	0 (0 %)	26 (28.88 %)
2.	Hanging	0 (0 %)	18 (20.00 %)	0 (0 %)	18 (20.00 %)
3.	Poisoning	2 (2.22 %)	30 (33.33 %)	0 (0 %)	32 (35.55 %)
4.	Drowning	1 (1.11 %)	4 (4.44 %)	0 (0 %)	5 (5.55 %)
5.	Physical Assault	0 (0 %)	0 (0 %)	5 (5.55 %)	5 (5.55 %)
6.	Electrocution	2 (2.22 %)	0 (0 %)	0 (0 %)	2 (2.22 %)
7.	Snake bite	2 (2.22 %)	0 (0 %)	0 (0 %)	2 (2.22 %)
Total		17 (18.88 %)	68 (75.55 %)	5 (5.55 %)	90 (100 %)

It was observed that 75.55% of deaths were suicidal in nature followed by accidental (18.88 %) and homicidal deaths (5.55%). Total 17.77 % of deaths were burns suicidal in nature, 11.11 % of deaths were accidental burns.

Discussion

An autopsy study of suspicious deaths in married females of below 30 years age was carried out in this Medical College from 1st August 2017 to 31st July 2018. During this one-year period a total of 1925 medico-legal autopsies were conducted, out of that 138 cases (7.16 %) were all age females with suspicious deaths. Out of which 90 cases (5.7%) were suspicious deaths of married female with age less than 30 years. Which is comparable to what was reported by Darji J.A.¹ et al (9.25%), Verma R.K.² et al (7.74%) and similar to Shrivastava A.K.³ et al (4.95%).

In the present study (Table No 1), it was observed that Maximum number (40 %) of deaths were observed in the age group of 21-25 years followed by 26-30 years (33.33 %) and less than 20 years 26.67 %. The findings in the present study are consistent with the study carried out by Zine K.U.⁴ et al (41.30%), Buchade D.⁵ et al (40.93%). Sharma B. R.⁶ et al noted that higher incidence (53.37%) of unnatural female deaths were in the age group of 21-23 years. The study conducted by Dere R.C.⁷ et al most common age group of unnatural death in females was 21-30 years (46.45%). This may be due to the fact that the common age of marriage in our region and many regions all over India is 18 to 23 years and deaths due to torture and mental harassment by husband and in-law's in relation to dowry in newly married females occurs in initial few years of married life. Also, this is the most active period of life where the females are expected to perform work related to cooking and allied work hence are more prone to accidents during kitchen related activities.

In the present study (Table No.2), it was observed that Most of the deaths (92.22 %) were observed in Hindu religion followed by Muslims (4.44 %) followed by Sikh (3.33 %). The study carried out by Darji J. A.¹ et al (94.18%), Pankaj Prajapati⁸ et al (92.04%) showed similar findings where most of the female victims were Hindu by religion. The Majority of the population from this region belongs to Hindu religion and dowry system is prevalent in this region resulting in a greater number of deaths in newly married females. The present

study also revealed that 4.35 % deceased females were Muslims and 2.90 % were Sikhs. These communities are comparatively in minority in this region hence death rate might be less in these communities.

From Table No.3, it was observed that 58.88 % of deaths of married females were within initial 3 years of their marriage which is highly significant followed by 4-7 years of marriage (27.77 %) It was observed that significant number (86.65 %) of female deaths occurred within 0-7 years of marriage. Similar findings were noted by Jaswinder Singh⁹ et al (44.97%), Darji J.A.¹ et al (57.28%), Verma R.K.² et al (57.47%), Praveen Arora¹⁰ et al (60.13%). This might be due to dowry demand, harassment, and physical / mental torture resulting in suicide or homicide of newly married females occurring more commonly in initial few years of married life.

In present study (Table No.4), It was observed that 54.45 % of female victims had children while 45.55 % female victims had no child. This might be due to after marriage there is a family and social pressure on the new couple for begetting child and one of the purposes of marriage is continuing the legacy of family.

From table No.5 it was observed that in accidental deaths in married female accidental burns was most common cause of death (58.82 %, 10 out of 17 accidental death cases). Quite similar findings were noted by Buchade D.⁵ et al (62.02%) and Chavan K.D.¹¹ et al (64.28%). Accidental burns can be explained by females spending most of the time in kitchen and thereby coming in contact with fire following inadequate precautions while cooking on cooking gas, kerosene stove and open unguarded chulha. Also, in rural areas kerosene lamp is still used during electricity failure which is very common. Wearing highly inflammable synthetic clothes, loose clothes like sari of the victims are highly susceptible to catch fire suddenly while cooking causing kitchen accidents. Also, the relatives of females might give the false history suggesting the incident to be accidental in nature for the settlement of property. In suicidal deaths, poisoning (44.11% - 30 out of 68 suicide cases) was most common followed by hanging (26.47 % - 18 out of 68 suicide cases) followed by burns (23.52 % - 16 out of 68 suicide cases) followed by Drowning (5.88 %). Similar findings were observed by Pankaj Prajapati¹² et al in his study on pattern of suicidal deaths in females (35.51% deaths by poisoning, 31.16% by hanging). Easy availability of household and pesticidal poisons in rural population might be cause for these preferences.

Likewise, easy availability of sari or dupatta, kerosene and matchstick might be responsible for such trends in suicidal deaths by hanging and burns.

Study of Various Osteometric Parameters of Human Mandible in Adult and Elderly Age Groups

Priyamvada Kurveti¹, Dheeraj Singh Verma², Jayanthi Yadav³, B.P. Dubey⁴

¹Assistant Professor, ²Demonstrator, Dept. of Forensic Medicine and Toxicology, Gandhi Medical College, Bhopal, ³Ex Professor and Head, Dept. of Forensic Medicine and Toxicology, Gandhi Medical College, Bhopal, Presently Additional Professor, Dept. of Forensic Medicine and Toxicology, AIIMS, Bhopal, ⁴Ex Professor and Head, Dept. of Forensic Medicine and Toxicology and Ex Dean, Gandhi Medical College, Bhopal., Presently Dean, L. N. Medical College, Bhopal

Abstract

The cardinal points of identity establishment can be met out with the help of mandibular anthropometry, when the bone is available for examination. A number of metric and non- metric parameters help in estimating the age from the mandible; which accurately differentiates various stages of life cycle

The main aim of this study is to study the various osteometric parameters of human mandible in adult and elderly age groups; and to determine their significance and utility for the purpose of identification in forensic sample.

For the purpose, 200 mandibles were measured anthropometrically. The data was collected in master chart and statistically analysed.

Height of the mandibular body, thickness of the mandibular body and maximum ramus height were found to be statistically significant parameters. Hence, these parameters could be used for allocation of a mandible to adult or elderly age group. It is also recommended to include other morphometric parameters of mandibles in the study to increase the accuracy and precision.

Key words: *osteometric, statistically significant, maximum ramus height*

Introduction

Estimation of age is extremely important in the identification of human remains. Chronological age assessment is an important part of medico- legal practice. The procedures for age estimation are complex and require the consideration of many factors. Bones undergo a series of changes from pre- natal to post- natal life; and changes in their composition and structure continue into old age and even after death. Hence, these form

a reliable source of information regarding growth and growth changes. Mandible is the largest and strongest bone of the face. Presence of a dense layer of compact bone makes it very durable and hence, remains well preserved than many other bones. In this study, age at the time of death was considered for study on mandible.

Mandibular dentition can help in estimating the age of an individual depending upon the eruption of mandibular teeth. This coupled with various subjective and morpho- metric parameters, help in arriving at the closest and accurate age range of the available forensic sample. A number of metric and non- metric parameters help in estimating the age from the mandible; which accurately differentiates various stages of life cycle

The main aim of this study is to study the various osteometric parameters of human mandible in adult and elderly age groups; and to determine their significance

and utility for the purpose of identification in forensic sample.

Material and Method

This prospective study was carried out on 200 mandible specimens in the Department of Forensic Medicine and Toxicology, Gandhi Medical College Bhopal. All the pathological, deformed and fractured mandibles were excluded from the study.

The criteria to decide the age of group of mandible were:

1. Dental examination and number of sockets present on the alveolar margin as it is known that age of eruption of third molar is 17 – 25 years.
2. Body – It is thick and elongated in adults and shallow and big in elderly.
3. Ramus – stunted and acute angled in adult and long and oblique in elderly.
4. Condylod process- open midway between the upper and lower border of body in adult and in elderly placed at near/ upper border of body.
5. Mental foramen – present midway between alveolar margin and inferior border of corpus of the body in adult and present near alveolar margin in elderly.

Mandibles were allocated to adult and elderly age group by forensic medicine experts and forensic anthropologists of the institute.

Osteometric parameters measured were as follows:

1. Height of the mandibular body was the direct distance from the alveolar process between 1st and 2nd molar to the inferior border of the mandible perpendicular to the base; measured with the help of sliding caliper.
2. Thickness of the mandibular body was measured at the level of 2nd molar perpendicular to the vertical axis of the body, using sliding caliper.
3. Maximum ramus height was measured between ^condyion superior and *gonion by Sliding caliper/mandibulometer.
4. Length of the mandibular body was the distance between #gnathion and gonion, measured using mandibulometer,

Landmarks

^Condylion superior-The most superior point of the mandibular angle.

***Gonion**-The most lateral and external point at the junction of the horizontal end of rami of the lower jaw.

#Gnathion-The middle point of the lower border of the mandible in the sagittal plane.

Fig-I: Measurement of height of mandibular body using sliding caliper

The data was collected in pre designed proforma and statistically analyzed using t test to find out the level of significance.

Findings

On statistical analysis, the results obtained were as follows:

LHEIGHT OF THE MANDIBULAR BODY:

Table – 1 Depicts mean and standard deviation of height of the mandibular body in male mandibles on both right and left side

Male			
Right		Left	
Adult	Elderly	Adult	Elderly

$P < 0.01$

Corici et al (2009)³ in his study carried out on 80 mandibles, also found this parameter to be significant.

Also, in a study conducted on OPGs of 113 edentulous patients aged 55-76 years, by Balwant Rai² in the year 2007, when the means +_ SDs are compared for each age groups in male and female subjects, the difference is not found to be significant.

II. THICKNESS OF THE MANDIBULAR BODY:

#67.7635	#64.6039	#67.7646	#64.6056
^3.8160	^8.5498	^3.8160	^8.5494

P<0.05

NOTE- Index for tables 1-6

*n= no of specimens

#M= mean

^ SD= standard deviation

Ionescu et al⁵ in his study in the year 2007 also described maximum ramus height as statistically significant. Dayal et al 2008⁴ found mandibular ramus height to be best parameter with an accuracy of 75.8 %. Similarly, Badiu et al (2010)¹ in their study found this parameter to be statistically significant (*p*< 0.05) . Saini et al⁸ in their study in the year 2011 on mandibular ramus flexure also found this parameter to have probability level of *p*< 0.001 and thus statistically significant.

IV. Length of the Mandibular Body

For this parameter, the mean +_ standard deviation for male on right side is 92.4818 +_5.6516 in adults &

92.2720 +_ 3.6925 in elderly and ; on left side, 91.4936+_ 5.4349 and 92.2738+_ 3.6928 for adult and elderly age group respectively; *P*=0.59 which is statistically insignificant. For females, on right side, the mean is 90.1219 with a standard deviation of 4.5758 for adult & for elderly it is 91.0450 with a SD of 3.6896 ; on left side, the mean and standard deviation are 90.1238and 4.5763 respectively for adult & for elderly, the mean is 90.6022 with a SD of 3.2550; *P*=0.85 making it statistically insignificant.

Comparison of means and standard deviations of elderly and adult samples is found to be statistically significant in case of height of the mandibular body, thickness of the mandibular body and maximum ramus height. Mandibular length was found to be statistically insignificant in this study.

Conclusion

In the study conducted on 142 adult and 58 elderly

mandible specimens, the level of significance was found to be high, in case of height of the mandibular body, thickness of the mandibular body and maximum ramus height. Hence, these parameters can be used for allocation of a mandible to adult or elderly age group.

Similar finding was obtained by Mohite et al⁶ in their study in the year 2011. They stated that, “A reduction in the height of the body of the mandible was observed with increase in age.” and ‘The width of cortex at the mental region (MI) and antegonial region (AI) shows a decrease in values with increasing age’; also, an increase in the size of the gonial angle was observed in this study.

Rai et al (2008)⁷ in his study on 120 lateral cephalograms found the maximum ramus height to be a significant parameter ($p < 0.05$) for this purpose.

It is recommended to evaluate the utility of other morphometric parameters of mandibles for the purpose of age estimation to increase the accuracy and precision.

Estimation of Stature from Footprint Length

Janarthanan. R¹ , Muthamizh Selvan P²

¹Assistant Professor, Department of Forensic Medicine and toxicology, Vinayaka mission's Medical College and Hospital, Karaikal, ²Assistant Professor, Department of Forensic Medicine & Toxicology, Mahathma Gandhi Medical College and Research Institute, Pondicherry

Abstract

The human foot is studied for various reasons in forensic departments, by anthropologists, anatomists etc. Footprints are of immense value in a crime scene in establishing the personal identity and in a potential link between the perpetrator and the scene of crime. Identification of a person is of prime and foremost importance in both civil and criminal cases. Time is a critical factor in crime scene investigation, so rapid identification of suspect is very important. Here, in our study, the aim is to estimate the stature of individuals based on their footprint lengths among the students (Both male and female students between the age group 18 to 22 years) 50 male and 50 female students, studying in Rajarajeswari Medical College and Hospital, Bengaluru.that the footprint length help us in estimating the stature of an unknown individual which will be helpful in investigation of various crimes. Also not much difference is statistically noted in the stature estimated by right and left footprint length in both the sexes.

Keywords: Stature; Foot print length; Identification.

Introduction

To establish the identity of a person if alive or expired is called identification of a person. The Latin word, 'idem' known as "the same"¹ is from which the word identification has its origination. Determination of identity of a person in case of emergency disasters like bomb blast, hurricane, train wreck, flight fall, earthquake etc. will not be an easy task for an autopsy surgeon to rectify the clarification of identity of a person from an amputated body part.² stature, in the pharmacological aspect is also important for to determine the nutritional range and for the estimation of pharmacokinetic measures of a person. The identification of a male or a female is made easier if the stature of a person is determined in any sort of investigation to determine the identity of a person.³

Aims and objectives of the study

To estimate the stature of individuals based on their footprint lengths

Material and methods

Materials used are as follows:

1. Printers black ink,
2. Non- breakable glass plate,
3. White sheets,
4. Roller,
5. Pencil,
6. Measuring scale,
7. Measuring tape,
6. Calculator and
7. Proforma.

Collection of Footprints

Both male and female students those who are

studying in Rajarajeswari Medical College and Hospital, Bengaluru -560074, between the age group 18 to 22 years will be included in the study. The consent of those students will be obtained in a pre-designed and pre-tested pro-forma consisting the objectives of the students after explaining them the aim and objective of the study.

A glass plate of 24x24 inches cleaned and smeared uniformly with painters ink will be kept on the floor.

The students after washing and drying their feet will be asked to stand on the smeared glass plate first and then, on two separate white sheets so that prints of right foot and left foot will be transferred on these white sheets separately. In this way footprints of all the individuals will be recorded. The footprint length will be measured from the heel to the tip of extension of longest toe.

Then all the students will be asked to stand bare foot and erect on the floor with their heel and occiput attached to the wall where markings for measuring height are already made. The students will be asked not to move the head. A thin plate is kept horizontally at the vertex of the head. Then the height will be measured from heel to the horizontal thin plate. Height of the individual will be measured in cm to the nearest mm.

The data collected is analyzed statistically by using descriptive statistics, namely percentage and standard deviation. The results will be predicted using SPSS version 20, if required, using linear regression equation for stature estimation and to assess the co-relation

between the footprint length and stature, Pearson’s correlation coefficient method will be adopted.

Place of Study: Rajarajeswari Medical College and Hospital, Bengaluru-560074.

Duration of Study: 1 year and one month.

Sample Size: 100 students (50 males and 50 females)

Inclusion Criteria

1. Both male and female students who are studying in Raja Rajeswari Medical College and Hospital, Bengaluru-560074 between the age group 18 and 22 years.
2. Students of both sexes.
3. Age group between 18 years to 22 years.

Exclusion Criteria:

1. Students other than the age group 18 to 22 years.
2. Students with any abnormality of foot/lower limb.
3. Students with any spinal abnormality.
4. Students with any endocrinal disorders.

Sampling Method:

Convenient sampling method.

Results

Table-1: Correlation between Right Foot Print Length, Left Foot Print Length and Stature in Male Students

Variable	N	Mean ± SD	Range	Cor. Coeff. r-value	Reg. Coeff. b-value	Reg. Equation
RFPL Actual Ht	50 50	24.7±1.25 173.5 ± 6.64	22.3–28.0 156 – 196	+ 0.659	3.49	Ht = 86.89+ 3.49 (RFPL)
LFPL Actual Ht	50 50	24.8±1.29 173.5±6.64	21.6–28.6 156 – 196	+ 0.0652	3.34	Ht =90.15 + 3.34 (LFPL)

RFPL = Right Footprint Length LFPL = Left Footprint Length

Ht = Height Comparing Right Footprint Length and Left Footprint Length P - 0.0

Table no.1 represents the height of 50 male students and the co-relation between the right and left foot print length.

The average of the right footprint is slightly larger than the left.

A relevant co-relation between the right footprint with stature ($r = 0.659$) and the left footprint length with stature ($r = 0.0652$). The difference in co-relation coefficient is statistically significant ($p < 0.000$). To determine the stature based on any given right or left

footprint length can be made with this significant co-relation.

When one such right footprint length is given, the stature can be estimated by the regression equation.

$$Ht = 86.89 + 3.49 (RFPL)$$

When one such left footprint length is given, the stature can be estimated by the regression equation.

$$Ht = 90.15 + 3.34 (LFPL)$$

Table-2: Correlation between Right Foot Print Length, Left Foot Print Length and Stature in Female Students

Variable	n	Mean ± SD	Range	Cor. Coeff. r-value	Reg. Coeff. b-value	Reg. Equation
RFPL	50	22.3±1.125	19.8-24.9	+0.761	4.426	Ht = 58.93+4.42 (RFPL)
Actual Ht	50	157.78±6.65	144-172			
LFPL	50	22.2±1.1	19.8-25	+0.747	4.438	Ht = 59.08+4.43 (LFPL)
Actual Ht	50	157.78±6.65	144-172			

RFPL = Right Footprint Length LFPL = Left Footprint Length

Ht = Height

Comparing Right Footprint Length and Left Footprint Length $P < 0.00$

Table no.6 represents the height of 50 female students and the co-relation between the right and left foot print length.

The average of the right footprint is slightly larger than the left.

A relevant co-relation between the right footprint with stature ($r = 0.761$) and the left footprint length with stature ($r = 0.747$). The difference in co-relation coefficient is statistically significant ($p < 0.000$). To determine the stature based on any given right or left footprint length can be made with this significant co-relation.

When one such right footprint length is given, the stature can be estimated by the regression equation.

$$Ht = 58.93 + 4.42 (RFPL)$$

When one such left footprint length is given, the stature can be estimated by the regression equation.

$$Ht = 59.08 + 4.43 (LFPL)$$

Figure 2. Right footprint of a student

Figure 03. Measuring height of a student

Discussion

Stature can be estimated from many parameters of the body parts, also the researches were made on them by many researchers. But very few researchers estimated stature from footprint length. Researchers did their work for foot length in both sexes but for the footprint length is rare. Our study is on both sexes of both right and left footprint length to estimate stature from it.

But in the study done by Devesh VO (2006)⁴, Danborn B (2008)⁵ and Vidya CS⁶, the footprint is lengthier in men than the women which is of same results as our study.

In our study, the footprints of both the foot in both sexes gives the height of an individual approximately for each foot and this is also seen the study made by Theodoros B Grivas⁷ (2008).

Our study gives the regression equations for both the footprint length by which the height can be determined whereas the stature from the known foot length only can be determined by a regression formula in the study made by Abraham Philip⁸.

In our study, only the length of the longest toe to the tip of the sole is taken to give the height of the student whereas in the work done by JaydeepSen (2008)⁹

The girls are less in height and they have length of their foot also little short than the boys. Also he stated that there is a good relationship which is significant between the height and the length and the breadth of the individuals foot. ($P < 0.01$).

Separate regressions equations were developed for both the footprints of both the genders in our study similarly, a study which was done only on males which had significance in the foot length and height with a $P < 0.001$ by Raju M¹⁰ (2009)

Also a similar research results were noted among the individuals of Uttarakhand region by Deopa Deep¹¹ (2010)

Assessment of Knowledge and Attitude of Adolescents Regarding Blood and Organ Donation in Selected Rural Areas of Shimla, Himachal Pradesh, India

Jinu.K.Rajan

Assistant Professor, Department of Nursing, College of Applied Medical Sciences, Majmaah University,, Kingdom of Saudi Arabia

Abstract

Objectives: The life force in all human beings, regardless of colour, race or belief, flows through their arteries and veins; it is red liquid which –depends on whether they are well or ill – bears good and bad tidings. Its various components form a highly developed defence and transport system which gives and saves life.

Method: The present study was aimed to assess the knowledge and attitude regarding blood and organ donation among adolescents in selected rural areas of Shimla, Himachal Pradesh, with a view to prepare a self instructional module. The research design used for this study was Non experimental descriptive design. Non probability purposive Sampling was used to select 100 samples for the study. The tool used for the study was structured interview schedule

Result: The findings of the study includes 33% of adolescents had inadequate knowledge and 77% of adolescents had favourable attitude regarding blood and organ donation. The study revealed that there was positive correlation ($r=0.268$) between the knowledge and attitude scores of blood and organ donation.

Conclusion: Distributing SIM regarding blood and organ donation helps the adolescents to have adequate knowledge, awareness and positive attitude regarding blood and organ donation.

Key words: *Knowledge, Attitude, Organ Donation, Adolescents*

Introduction

Blood is a whole world in itself, each component having a specific job – red blood cells transport oxygen throughout the body; plasma transport proteins, including antibodies and clotting factors, and nutrients like glucose for energy around the body; white blood cells constitute defence mechanism against disease, and platelets ensure that bleeding stops. Blood also carries waste products from all the organs to be evacuated from the body.¹ Eligibility criteria for blood donation are donor should be between 18 –55 years of age with a weight of 50 kg or above with normal pulse rate, normal body temperature and normal blood pressure. Both man and women can donate blood. There are only few conditions in which donors are permanently excluded. The donor with history of epilepsy, psychotic disorders, abnormal bleeding tendencies, severe asthma, cardiovascular

disorders, and malignancy is permanently unfit for blood donation. People who have undergone surgery may safely donate Blood after 6 – 12 months. For woman donors who are pregnant or lactating, blood is not taken as their iron reserves are already on the lower side.²

Method

In view of the nature of the problem under study and to accomplish the objectives of the study descriptive approach was found to be appropriate to assess the knowledge and attitude regarding Blood and organ donation among the adolescents In view of the nature of the problem under study and to accomplish the objectives, Non experimental descriptive survey design was adopted to assess the knowledge and attitude of adolescents regarding blood and organ donation.

The study was conducted in selected rural areas under Surathkal PHC. In the present study, the target population consists of adolescents residing in a selected rural area at Shimla, and accessible population consists of adolescents in the age group of 12-21 years residing in a selected rural area at Shimla.

The sample for the study consists of 100 Adolescents who met the inclusion criteria and are residing in a selected rural area at Shimla. Non probability purposive sampling was used to select the samples.

This study received ethical approval from the Institutional Review Board of the parent institution. Individual Informed consent was taken from the sample before the data collection.

Results

SECTION A: Description of demographic Variables.

While assessing the demographic data it showed that the majority of the adolescents 72 (72%) belonged to the age group of 18 – 21 years and about 71 (71) % were Males and 29 (29 %) were females. The data also showed that the highest number 87 (87%) of adolescents belonged to Hindu religion from nuclear families.

The majority of the adolescents 61 (61%) had health information from television programs, 8 (8%) of the adolescents had health information from radio programs, 31 (31%) of adolescents had health information from newspaper and magazines. The data also showed that most 93 (93%) of the adolescents were not registered, very few 7 (7%) of the adolescents were registered for blood & organ donation.

SECTION B: Frequency and percentage of knowledge scores of adolescents regarding blood and organ donation.

Table 1: Frequency and percentage of knowledge scores of adolescents regarding blood and organ donation

n=100

S.No	Level Of Knowledge	Frequency(F)	Percentage (%)
1.	Adequate Knowledge	10	10
2.	Moderately Adequate knowledge	57	57
3.	Inadequate Knowledge	33	33
	Total	100	100

Table 1 showed that 33 (33%) had inadequate knowledge 57 (57%) had moderately adequate knowledge and 10(10%) of adolescents had adequate knowledge regarding blood and organ donation.

SECTION-C Frequency and Percentage of Attitude

Table 2: Frequency and percentage of attitude scores regarding blood and organ donation among adolescents.

n=100

S.No	Level of Attitude	Frequency(F)	Percentage (%)
1.	Favourable attitude	77	77
2.	Moderately favourable attitude	23	23
3.	Unfavourable attitude	-	-
	Total	100	100

Table: 2 showed that 77 (77%) had favourable attitude, 23(23%) had moderately favourable attitude and 0(0%) had unfavourable regarding blood and organ donation.

SECTION – D Correlation of Knowledge Scores With attitude Scores Regarding Blood and organ Donation among Adolescents.

a) Table 3: Mean and standard deviation of adolescents regarding `blood and organ donation among adolescents.

n=100

S.No	Variable	Mean	Standard Deviation
1	Knowledge	17.81	5.69
2	Attitude	54.56	5.77

Table 3 Showed that mean score of knowledge and attitude regarding, blood and organ donation were 17.81(SD+ 5.69) and 54.56(SD+5.77) respectively.

b) Table 4: Correlation of knowledge and attitude scores among Adolescents regarding blood organ donation.

n=100

S.No	Variable	Mean	Co Efficient of	Table
1	Knowledge	17.81	0.268	0.195
2	Attitude	54.56		

(df: 98) (P< 0.05=0.195)

Table 4 showed that there was positive correlation (r = 0.268) of knowledge and attitude regarding blood and organ donation among adolescents at 0.05 level

($\chi^2=3.52$).

SECTION –E Association of knowledge scores regarding blood and organ donation among adolescents with their selected demographic variables.

When the Association of knowledge scores regarding blood and organ donation among adolescents with their selected demographic variables were assessed it showed that Chi Square values were calculated to find out the association between knowledge scores of adolescents with their demographic variables regarding blood and organ donation reveals that there is association between knowledge scores when compared to age ($\chi^2=13.58$) and there is no-association between knowledge scores when compared to sex ($\chi^2=1.43$), Religion ($\chi^2=2.067$), family type($\chi^2=0.056$), Education ($\chi^2=6.63$), Health Resources ($\chi^2=5.74$) and Registration

SECTION –F Association of attitude scores regarding blood and organ donation among adolescents with their selected demographic variables.

When the Association of attitude scores regarding blood and organ donation with with their selected demographic variable were assessed it showed that the Chi Square values were calculated to find out the association (table 7) between the attitude scores adolescents with their demographic variables regarding blood and organ donation reveals that there is association between attitude scores when compared to sex ($\chi^2=5.98$), Religion ($\chi^2=7.89$) and there is no association between attitude scores when compared to age ($\chi^2=3.55$), family type ($\chi^2=0.12$), Education ($\chi^2=2.26$), sources of Information ($\chi^2=0.02$) and Registration ($\chi^2=0.32$).

Discussion

First Objective: Assess the knowledge regarding blood and organ donation among adolescents.

The data analysis showed that, the assessment of knowledge regarding blood and organ donation among 100 adolescents revealed 33% had inadequate knowledge, 57% had moderately adequate knowledge and 10% had adequate knowledge. Area wise analysis shows that mean score of physiology of blood is 2.48(SD \pm 1.2), blood donation criteria 3.83(SD \pm 1.47), care following blood donation 0.83(SD \pm 0.67), safe blood donation 1.43(\pm SD0.53%), meaning of organ donation 1.37(SD \pm 0.70) type of organ donation 0.85(SD \pm 0.71), criteria for organ donation 4.97(SD \pm 2.21) ,timing for organ donation 1.92(SD \pm 1.6)and contraindications for organ donation 0.11(SD \pm 0.3). The overall mean knowledge scores of blood and organ donation among adolescents was 17.79(SD \pm 9.39). It revealed that there was a need for creating awareness regarding blood and organ donation. This finding is consistent with the study findings of Androulakiz et. al., (2005)³ where 53.2% had inadequate knowledge about blood donation, and also it is consistent with the study finding of Gallagher,B. (2000)⁴ where 67.9% had lack of awareness regarding organ donation.

Second Objective: Assess the attitude regarding blood and organ donation among adolescents.

The data analysis showed that in assessing the attitude regarding blood and organ donation among 100 adolescents 77% had favourable attitude, 23% had moderately favourable attitude.

This finding was supported by the study conducted by Suárez I, et al. (2004)⁵ on public attitudes regarding the blood donation and storage of specimens. The study results revealed 42% had favourable attitude regarding blood donation. Chernenko,S.M. et. al. (2005),⁶ conducted a study in Hong Kong to study attitudes of local medical students with regard to organ donation. A majority (85%) had a positive attitude but only a (23%) had signed the organ donation card.

Third Objective: Find the relationship between knowledge and attitude regarding blood & organ donation among adolescents.

The data analysis revealed that the relationship between knowledge and attitude score of blood & organ donation among adolescents showed that there

is a positive correlation ($r=0.268$) between knowledge score and attitude score of adolescents regarding blood & organ donation. Hence the research H1=There will be significant relationship between knowledge score and attitude score regarding blood and organ donation among adolescents was accepted.

This finding is consistent with the study findings of Singh, P. et. al. (2002)⁷ where the results revealed medical students had highly positive attitude towards organ donation (mean score 4.34, +0.46). This may be because the medical students had adequate knowledge regarding organ donation.

Fourth Objective: Find the association between the level of knowledge regarding blood and organ donation with their selected demographic variables.

The study showed that there was statistically significant association between the level of knowledge with age ($\chi^2=13.58$) at $p<0.05$ level. Therefore the research H2= There will be significant association between knowledge score regarding blood and organ donation among adolescents with their selected demographic variables was accepted except for sex , religion, family type ,education, health resources, registration.

This finding is consistent with the findings of Lowe, K. C. et. al. (2003)⁸ where the results revealed the study samples from different culture and language groups (German, French & Italian) showed difference in the knowledge related to organ donation.

Fifth Objective: Find the association between the level of attitudes regarding blood & organ donation with their selected demographic variables.

The study showed that there was statistically significant association between the level of Attitude with sex ($\chi^2=5.98$) and religion ($\chi^2=7.89$) at $P<0.05$ level. Therefore the research H3 = There will be significant association between attitude score regarding blood and organ donation among adolescents with their demographic variables was accepted except for age, type of family, education, health resources, registration.

This finding is consistent with the findings of Gillespie, T.W. et. al. (2002)⁹ where the study findings revealed the main reason for not agreeing organ donation was belief of inappropriateness related to religion (25.7%), and there was no significant difference based on gender.

Conclusion

This study finding concluded that the adolescents in the community had less knowledge regarding blood and organ donation. The SIM will play an important role in improving the knowledge and positive attitude of adolescents regarding blood and organ donation.

Abstract

Monitoring of blood glucose levels is clinically crucial in managing diseases affecting insulin secretion and resistance, most notably diabetes mellitus and cystic fibrosis. Blood glucose is used to monitor the amount of glucose in the blood, especially patients with symptoms with the abnormality of high or low blood glucose levels. Most recently, they enable diabetic patients to administer appropriate insulin doses to human health. The availability of in-house glucometers, as opposed to clinical-use equipment, has dramatically improved the quality of life of diabetic's patient. However, such monitors require a blood draw through finger pricks for each test, which causes pain and inconvenience. Each test also needs a new test-strip, contributing to the recurring cost of such a device. Typically the blood glucose monitoring is the non-invasive technique which may cause distress and discomfort, particularly in the pediatric patient. We introduce an architecture that uses Near Infrared (NIR) spectroscopy to determine blood glucose levels based on transmittance spectroscopy on the nose lobe. The Measurement of glucose in the respiratory fluid by a collection of exhaled breath in condensate and therefore, a potentially clinically useful method of estimating blood glucose levels identified and therefore it is the excellent agreement between these diabetics blood glucose level.

Keyword: *Insulin secretion, Diabetes mellitus Glucometer, Near-infrared spectroscopy, Diabetes mellitus.*

Introduction

Diabetes mellitus is a disease resulting from insufficiency of insulin in the body causing elevated blood-glucose levels known as hyperglycemia, or reduced glucose concentrations, known as hypoglycemia [1]. Insulin is the hormone secreted from the pancreas to mediate metabolic reactions from glucose level into the body. Initiates have taken to decrease blood glucose level in the body, and hence reduce the human risk to live a long life. Diabetes is associated with many medical conditions such as celiac disease, cystic fibrosis, tuberculosis and heart disease for all groups of peoples [2]. Such conditions result in retinopathy which leads to blindness, nephropathy rise to renal failure, and peripheral nerve affected with increased in the human risk of foot ulcer, cardiovascular diseases or final stage of cancer which leads to death. Diabetes mellitus is the manageable disorder in which the of blood glucose is monitored daily so that diabetics affected person won't get afraid because every time the affected person

feels the blood glucose level will rise faster, it leads to significant risk [3]. The diagnosis and monitoring of blood glucose in the human body currently used in medical studies such as pre-diabetes patients involves the use of blood tests before and after fasting in real time situation. Blood glucose level is done by drawing the blood samples from the patient using a typical glucometer to measure the reading in digital form. This glucometer measurement involves pricking a drop of blood from the human body and placing the drop of blood on a sensitive area of the strip which is inserted in an electronic reading instrument in digital form [4]. This method is very painful, invasive and it is unsafe for diabetic's patient. Therefore, it will not suit all people, especially where the patient wants several samples of a blood test each day. The emerging technique built on the advancement measurement technologies provides a non-invasive method for diabetic's disease and diagnosis of the disease in the early stage itself [5]. The application of acetone detection has potential attention which

rapidly distinguishes between healthy and unhealthy diabetic patients. These remarkable results are achieved to improve analytical techniques performed in the last ten years [6]. This method uses the single instrument and skilled operators for testing the blood glucose level both in fasting and after fasting with the duration of minimum two hours [7]. Furthermore, the technique includes low cost with high accuracy of result for all type of diabetics' patient, i.e., TYPES I, TYPE II diabetics [8]. The next section will briefly summaries about the materials and methods and findings which are used to identify the earlier stage of diabetics.

Material and Method

Envoy Kirchsteiger, Luca Zachariah, Eric Reynard, Luigi del has proposed the issue of online adjustment and recalibration for nonstop checking the blood glucose level to severe diabetics in the beginning time [9]. Two distinctive parametric relations among interstitial and blood glucose are examined, and valuable calculations to adaptively appraise the parameters inside those relations are proposed [10]. One trademark is the clear thought of estimation vulnerability of the gadget used to gather the alignment estimations. Another component is the programmer discovery of finger stick estimations that are not appropriate to be utilised for alignment. Since the techniques depend on the arrangement of straight grid imbalances bringing about arched improvement issues, the calculations are of moderate computational multifaceted nature and could be actualized on a CGM gadget. The strategies were surveyed on clinical information from 17 diabetic patients, and the enhancements as for the present best in class appear [11]. Yang Jin; Hong Wang, Hayman Cal, Zhenjiang Lv, Shiyuan Yang, Hayman Cai, Jun Feng Jiang and Tsinghua has proposed the electrochemical techniques which have been generally utilised in the concoction and pharmaceutical ventures, which require exact fixation estimations, substance response location and examination for people with diabetes quiet. The electrochemical potentiostat, the central component in electrochemical instruments, have been examined as an exciting issue tending to the trouble of applying high-accuracy consistent voltage and Pico ampere current estimations [12]. Then, dependable potentiometer is very favourite for convoluted mechanical situations with commotions just as prerequisites of remote screens. This paper portrays a potentiostat for automatic glucose estimation that isn't only exact yet also blame tolerant to ensure consistently high quality in modern conditions.

They showed adaptable pH sensor and glucose biosensor altered by attractive dabs and graphene was proposed. The ruthenium dioxide detecting films were kept by radio recurrence sputtering framework, and the screen printed system was utilised to build the silver directing wires and a protective layer of the cathodes. To improve execution of the pH sensor and glucose biosensor, the smaller scale fluidic gadget had been used and created [13]. In the estimation forms, the different pH and glucose arrangements were researched in different stream rates. As indicated by the test results, the natural affectability of the pH sensor was improved, and the natural affectability of the 2/grapheme/attractive dot GOx-Nafion glucose biosensor was upgraded from 10.628 to 13.541 mV/mm. Concerning the remote detecting estimations, the remote detecting framework which agreed the ZigBee standard was utilised to transmit the signs of the pH or glucose estimations in this examination. Xbee gadget, Arduino Mega 2560, a readout circuit, pH or glucose biosensor and PC. Without diabetes, your body tracks glucose levels throughout the day and night to guarantee the appropriate measure of insulin is discharged at the correct time with hazard free appraisal. To effectively oversee diabetes, an observing framework is expected to check your glucose levels in the body reliably. The breathing sensors incorporate transducers connected to the human body. For instance, customarily utilised strategy utilises two versatile groups implanted with sensors around the ribcage and stomach area to screen their developments. Data on the different movements of the ribcage and midriff give data about breath exertion. Albeit worthy for shorter timeframes, this strategy is inadmissible for long haul checking or observing of dozing patients. A fasting blood glucose test is the favoured strategy to analyse diabetes and guideline out different conditions. This test is done after an individual has had nothing to eat or drink except water for somewhere around 8 hours. It is for the most part begun medium-term so the test should be possible in the first part of the day. A self-observing test or blood glucose checking by finger prick is a quick and straightforward technique for distinguishing issues with glucose levels. The average blood glucose levels fluctuate contingent upon which test was performed, regardless of whether an individual was fasting before the test, and whether any exceptional dietary or glucose substances were given amid testing. Expanded dimensions of blood glucose, a condition known as hyperglycemia, might be brought about by the accompanying blood glucose level in a reasonable state.

Findings

The figure 1 shows the hardware circuit and to implemented to the patient for monitoring the blood glucose level with fast fasting. The net results can be achieved in digital a value which is the accurate measurement and it can vary from +20 to -20 variations in the blood sugar level. The figure 2 shows the hardware circuit and to implement to the patient health monitoring the blood glucose level without fasting. The

net results can be achieved in digital a value which is the accurate measurement and it can vary from +20 to -20 variations in the blood sugar level. Both the hardware circuit implemented for patient health monitoring is the non invasive method of testing the blood glucose level. The figure 3 and 4 shows the output interns of dyadic wavelet transformation and the time domain factor and probability distribution of signal analyzed with respect to discrete wavelet transform.

Figure 1 Before Fasting

Figure 2: After fasting

Figure 3: Simulated Output

Figure4: Probability distribution of a signal

Conclusion

There have been continuous advances in the field of glucose monitoring during the last four decades, which have led to the development of highly evolved blood glucose meters, non-invasive glucose monitoring (NGM) devices and continuous glucose monitoring systems (CGMS).Glucose monitoring is an integral part of diabetes management, and the maintenance of physiological blood glucose concentration is the only way for a diabetic to avoid life-threatening diabetic complications. This technique is highly useful for random test in the blood glucose level for monitoring the health condition in the early stage and probably when diagnosis is identified in the early stage the condition to

maintain blood sugar in Normal Mode.

Future Developments:

In future, the glucose level can be measured by using sweat, saliva and tears. Monitoring of blood glucose level can be measured by using noninvasive techniques. Noninvasive techniques are used than invasive technique which can create distress and discomfort such as finger prick method. Glucose monitoring is an integral part of diabetes management, and the maintenance of physiological blood glucose concentration is the only way for a diabetic to avoid life-threatening diabetic complications.

Abstract

Introduction: Medical negligence is the breach of legal duty to care which includes the damages, and establishing causation. Awareness towards medical negligence is increasing day by day among patients. Recent court rulings have also been in favour of the complainants where there is proven case of negligence which has encouraged others to take up their grievances. There is no special subject where dentists learn about legal aspects of medical negligence. Hence this study was done to assess their knowledge on legal aspects of medical negligence.

Materials and Method: An online questionnaire with 15 questions regarding legal aspects of medical negligence was sent to 100 dentists of a well reputed dental college. The completed forms were evaluated. The results were calculated as percentage and tabulated as graphs.

Result: The awareness was less among dentists for most of the questions. Majority of them knew the term medical negligence but terms least known were *res ipsa loquitur*, *bolam's test* and *Bolitho case*. The other questions had less than an average response.

Conclusion : The survey results showed that the knowledge of dentists regarding the legal aspects of medical negligence was poor. This survey assessed the knowledge of the dentists and also enlightened the respondents with answers pertaining to the questions. More awareness must be created so that doctors are more careful and hence patients benefitted.

Keywords: Medical negligence, law, knowledge.

Introduction

Medical negligence is the breach of legal duty to care which includes the damages, and establishing causation⁽¹⁾. After the Consumer Protection Act, 1986, numerous cases are reported against doctors due to

public awareness which is growing now in India. A breach of this duty gives a patient the right to initiate action against negligence⁽²⁾. Recent court rulings in favour of the complainants where there is proven case of negligence has encouraged others to take up their grievances⁽³⁾. Medical error is the third leading cause of death in the US, accounting for 2.5 lakh deaths every year. But no such data is available in India. Patients often allege that doctors try to save each other even when the case is re-referred to medical boards for investigation⁽³⁾. Cases of medical negligence are also heard of in the field of dentistry but no data is available on the percentage per year. Recently, in December 2018, there was a case which involved a private dental clinic in Ambattur, Chennai, where the court asked the dentist to pay back the patient the treatment cost along with a sum of Rs.15,000 for

mental agony caused during the process due to medical negligence. This study is important because there is no special subject where the dentists are exposed to law and medical negligence in their curriculum, hence assessing their knowledge and creating awareness will make the dentists more responsible towards their patients.

Materials and Method

An online questionnaire consisting of 15 questions regarding knowledge on legal aspects of medical negligence was sent to 100 dentists of a well reputed dental college in Chennai, South India. The survey was conducted between October 2018 to January 2019. The details regarding the age, gender and years of experience in dentistry was collected with each form. The respondents had to choose between options 'know' and 'don't know'. If the respondent knew the answer, he/she had to check it with the answers that were provided after the questionnaire section and then choose the option 'know' if it correlated or the option 'don't know,

if the answer was wrong or did not correlate with the right answers. The scores were given as good, fair and poor if the number of known responses were between 60-100%, 30-59% and 1-29% respectively.

Results

81% of the respondents were between 20-30 years of age, 75% were females and 60% had experience less than 5 years. The age distribution, gender and years of experience are represented in Fig 1-3. Among the 15 questions regarding law and medical negligence in India, knowledge was good regarding the terms and questions on medical negligence, consumer protection act, arrest of the doctor and punishment for medical negligence, knowledge was fair regarding the terms Burden of proof, Civil negligence, Criminal negligence, punishment for free services and the Standard to judge the negligence of the doctor and knowledge was poor for terms like Implied undertaking, *res Ipsa loquitur*, Bolam's test, Bolitho case and Vicarious liability. The results of the survey are tabulated in Table 1.

Table 1: The responses(in %)for the medicolegal terms and questions

S.No	Knowledge on	% Who knew	% Who didn't know
1	Medical negligence	91	9
2	The Standard to judge the negligence of the doctor	45	55
3	Implied undertaking	29	71
4	Res Ipsa loquitur	2	98
5	Bolam's test	2	98
6	Bolitho case	3	97
7	Civil negligence	51	49
8	Criminal negligence	60	40
9	Punishment for medical negligence	66	34
10	When can a doctor be arrested?	40	60
11	Are you punishable for free services?	39	61
12	When is the dr not punishable?	47	53
13	Vicarious liability	14	86
14	Burden of proof	24	76
15	Consumer protection act	69	31

Discussion

Doctors are expected to deliver good service at all times. But if there is a breach in the duty due to an act of commission or omission then they are said to be medically negligent. The consequences that follow when a patient takes this legally is of great importance to the doctor. Knowing the laws that govern medical negligence will help the doctors serve patients better and more cautiously .

A study by AIIMS forensic department has revealed wrong treatment is the most common reason for people to complain about medical negligence, followed by lack of care, no treatment and forced discharge⁽³⁾.

People are more educated now than before. They are aware of their rights. In the medical field, the public can procure their rights through Consumer protection act. 69% of them knew the term consumer protection act. Consumer protection act came out in 1986 which means any fault, imperfection, shortcoming, or inadequacy in the quality, nature, or manner of performance that is required to be maintained by or under any law for being in force at that given time⁽²⁾. This term has also been used for other services consumed including medical services.

Doctors must exercise an ordinary degree of skill ⁽⁴⁾. No doctor can give a warranty of the perfection of their skill or a guarantee of cure. If the doctor has adopted the right choice of treatment, if she/ he is skilled and has worked with a method best suited to the patient, she/ he cannot be blamed for negligence if the patient is not totally cured ⁽⁵⁾. Dr Abhishek Yadav, who led the study in AIIMS , told that allegations were found to be more in common in groups of children and adolescents (50%) with a declining trend with increase in age⁽³⁾.

Better characterizing these events can educate providers with the goal of improving patient care⁽¹⁾.

Among all the questions medical negligence which is breach of the said duty; and consequential damage that follows was the term maximum known. This may be due to frequency of hearing more than the other terms.

Its understood that any professional in their field (law, medical, engineering) acquires and has the skill that profession needs after graduating. A doctor need not possess the highest expert skill. The standard of the accused doctor is adjudged with an ordinary doctor of the same profession with ordinary skills⁽⁶⁾.

Majority of them did not know the term Implied undertaking which means that any person who offers medical advice and treatment implicitly state that they have the skill and knowledge to do so, that they have the skill to decide whether to take a case, to decide the treatment, and to administer that treatment⁽⁷⁾. Doctors said lack of communication between the doctors and patient is a major cause of discontent. “Doctors should refrain from making vague promises of complete recovery and should always explain the complication

or unforeseen danger associated with the treatment procedure,” said a doctor at AIIMS ⁽³⁾.

The questions with the least responses were Res ipsa loquitor, Bolam’s test and Bolitho case. The principle of res ipsa loquitor is ‘thing speaks for itself’. For e.g. prescription with the wrong medicine or a cotton swab/ instrument inside the lesion during surgery. With nearly 5,000,000 Indians dying due to medical negligence every year, experts claim that a specialised course for doctors and hospital staff focusing on how a critically ill or injured patient should be handled could bring down the figure by almost 50 per cent⁽⁸⁾. There are examples of few cases in Tamil Nadu recently which got medical negligence to limelight like 1) a case where HIV infected blood was transfused to a 8 month pregnant lady ,2) an accusation against a gynaecologist for leaving a sanitary napkin behind during the C-section.3) A lady was misdiagnosed as pregnancy positive but had a tumour instead. This is mainly due to medical negligence. In certain circumstances no proof of negligence is required beyond the accident itself⁽⁹⁾.

2)According to Bolam’s test, a doctor, who acts by a practice accepted as proper by a responsible body of medical men, is not negligent mainly because there is a body of opinion that takes a logical reasonable view. The typical rule for assessing the appropriate standard of reasonable care in negligence cases involving skilled professionals. The law imposes a duty of care between a doctor and his patient, but the standard of that care must be in accordance with the responsible body of opinion (medical board), then he is not considered negligent. This is known as Bolam test propounded by McNair J in Bolam v. Friern Hospital Management Committee (1957) 2 All ER 118 in the UK. It has been approved and followed by the courts in India⁽¹⁰⁾.

3)Bolitho case is causation must be proved to bring a claim in negligence and whether the doctor acted by a practice accepted as proper by an ordinarily competent doctor. In his opinion delivered in the Bolitho case, Lord Browne-Wilkinson indicated that experts should direct their minds to the question of comparative risks and benefits in order to reach a defensible conclusion on the matter in question. A clinical conclusion which does not have risk analysis at its heart is not likely to be deemed a responsible conclusion⁽¹¹⁾. Over time, the Bolam test evolved in the English courts and was made stricter by the Bolitho case. But the Indian courts still follow the

Bolam test.

More than half knew the term civil negligence which means the professional shows negligence but does not cause death of the patient. Less than half knew the term criminal negligence but the punishment given was known by greater number of them. Section 304A[10] of the Indian Penal Code of 1860 states that “ whoever causes the death of a person by a rash or negligent act not amounting to culpable homicide. The doctor shall be punished with imprisonment for a period of two years, or with a fine or with both. ” but this is used to deal with both cases of accidents caused due to rash and negligent motor vehicle driving and also medical negligence leading to the death of a patient.

Sections 80 and 88 of the IPC(Indian Penal Code) contain defences for doctors accused of criminal liability. Nothing is an offence that is done by accident or misfortune and without any criminal intention under Section 80. A private complaint of rashness or negligence against a doctor may not be entertained without prima facie evidence in the form of a credible opinion of another competent .In addition, an independent opinion should be received from an investigating officer, preferably of a government doctor. A doctor may be arrested only if the investigating officer believes that she/ he would not be available for prosecution unless arrested which was known by majority of them⁽¹²⁾. Negligence cannot be attributed to a doctor merely because the doctor chooses one procedure over other, he won’t be liable when done with proper care and caution.

Before, doctors were not liable for their services individually or vicariously if they do not charge fees. Now under the torts law or civil law, they can be punished even if the doctor provides free services. Less than a quarter knew that many a time the doctor will also be responsible vicariously, meaning thereby if his employee/servant rashly causes the death of a patient. In that case, the employee as well the doctor will be liable due to the principle of ‘Vicarious Liability’ under Tort law⁽¹³⁾.

Burden of proof is on the one who complains. Patient has to try and prove the doctor’s fault. If a patient alleges malpractice in medical field, the law will require a higher standard of evidence to support it. The best evidence available in medical science presented with expert opinion is required by the complainant to prove negligence by the doctor. It was held that negligence has

to be established and cannot be presumed⁽¹⁴⁾ and it must be proved by the onus as in *Kanhaiya Kumar Singh vs Park Medicare & Research Centre*. Informed consent, full details of the patient, details of investigations and the treatment provided must be maintained by the hospital as precautionary measures.

Conclusion

This survey is the first of its kind to assess the knowledge of dentists and make them familiar with terms regarding legal aspects of medical negligence in India. The survey results have shown that there is less awareness among dentists regarding law and medical negligence. Limitations of this study would be choosing the sample in a single institution. In future, research should be carried out on a larger sample to assess the knowledge of dentists, conduct education programmes for evolved dentists, and a subject on the basics of medical law which would include legal aspects of medical negligence must be added to the dental curriculum for evolving dentists since knowledge regarding this is important for both the doctors and patients since both their rights and dignity have to be maintained.

Nasal Height as a Parameter for Stature Estimation & Sex Differentiation in Dehradun Region

Jyoti Barwa¹, Rattan Singh²

¹Assistant Professor, Department of Forensic Medicine & Toxicology, Shri Guru Ram Rai Institute of Medical & Health Sciences, Patel Nagar, Dehradun, Uttarakhand, ²Assistant Professor, Himalayan Institute of Medical Sciences, SRHU, Jolly Grant, Dehradun, Uttarakhand

Abstract

Introduction: Stature is one of the most important parameters in the identification of an individual, living or dead. In intact bodies, stature estimation does not pose any problem but when dismembered human body parts are involved, it is of a challenge for the forensic pathologist as these parameters are highly sex, race and age dependent.

Materials & Method: The study was conducted in Shridev Suman Subharti Medical College, Dehradun among a total of 158 healthy subjects (17-25 years), comprising 79 males and 79 females. Those with cranio-facial defects were excluded from the study. Mean stature and nasal height were obtained by direct measurement; co-relation co-efficient were obtained and regression equation formulated for estimating stature.

Observations & Result: The study showed that in males mean values are significantly higher than females for both stature as well as nasal height; stature (males, 172.3435 ± 6.48442 ; females, 158.9430 ± 5.64269), nasal height (males, $5.0341 \pm .37075$; females, $4.6770 \pm .30431$). Nasal height in total subjects and individually in males is significantly ($p < 0.05$) and positively correlated with stature. However, in females it is found to be statistically insignificant. These values can be employed in estimation of stature using the linear regression equation $Y = 155.251 + 3.395$ (nasal height of Males), $Y = 151.170 + 1.662$ (nasal height of females). Also, accuracy in predicting sex when mean nasal height is taken as independent variable is more in females as compared to males (F=77.2%, M= 68.4%).

Conclusion: Nasal height can be used as a reliable tool in estimating stature, particularly in the males and in females it can be used for determination of sex with accuracy.

Keywords: Nasal height, stature, identification,

Introduction

The branch of physical anthropology that deals with measurements of different body parts is known as Anthropometry.¹ Various bones of the human skeleton have been employed for reconstruction of stature and

prediction of sex by many scientists with varying degree of accuracy.^{2,3,4,5} Although a wide variety of long bones have been employed for stature estimation, only few studies have utilized the cranio-facial dimensions in this regard.³ Hence, establishment of alternative methodologies for estimation of stature still requires elaborate studies.

Assistant Professor, Department of Forensic Medicine & Toxicology, Himalayan Institute of Medical Sciences, SRHU, Jolly Grant, Dehradun, Uttarakhand-248140

In archaeological procedures or in forensic examinations after mass disaster, estimation of height is done from rudiments or fragments of bones for the purpose of identification.² The body segments exhibit consistent ratios among themselves and also relative

to the total body height.⁶ Thus, in addition to the limb measurements, various cephalo-facial indices such as head circumference, facial length, facial width, nasal height, nasal width etc are amongst some of the clinical anthropometrical parameters that can be used for estimation of stature.³

Although, many formulae for stature estimation have been proposed, there is no universally applicable formulae as the ratios of the body segments and stature are dependent on age, sex and race.^{6,7} This study aims to estimate stature of the study population in Dehradun region using nasal height by regression equation and to predict reliability of nasal height in sex differentiation.

Materials & Method

The study was conducted in Shridev Suman Medical College, Dehradun among healthy students of the Institute, subjects varying in age from 17 to 22 years. A total of one hundred and fifty eight (158) subjects

were involved which comprised of 79 males and 79 females. Those having any cephalo-facial defects or spinal deformity (kyphosis, scoliosis) were excluded from the study. A written informed consent was duly obtained from all the willing participants; procedure and purpose of study was explained in detail. The stature was measured using an anthropometer as the vertical distance between vertex and heel touching the floor or ground surface, with the person standing erect and head in a Frankfort plane. A vernier calliper was used for measuring nasal height; the distance between nasion to nasopinale of the nose i.e from the point in midline where the frontonasal suture and the median plane intersect, taken on the frontal, to the lowest point at the start of the nasal floor. It was taken on both sides; to minimise subjective errors, all these measurements were taken twice and an average was duly noted. Mean of the stature and nasal height was obtained for both sexes, correlation co-efficient calculated and a regression equation was formulated using statistical software SPSS version 20.

Observations & Result

Parameter		Mean	Std. Deviation	Correlation value [r]	R2	P value
Total subjects (n= 158)	Mean stature	165.6433	9.04919	.437	.191	.000
	Mean Nasal Height	4.8555	.38259			
Females (n= 79)	Mean stature	158.9430	5.64269	.090	.008	.216
	Mean Nasal Height	4.6770	.30431			
Males (n= 79)	Mean stature	172.3435	6.48442	.194	.038	.043
	Mean Nasal Height	5.0341	.37075			

In the study, it was observed that mean stature and mean nasal height was significantly higher in males as compared to females i.e in Males stature was 172.34 ± 6.48 while in females it was 158.94 ± 5.64 ; nasal height in males was 5.03 ± 0.37 and in females it was 4.68 ± 0.30 . Also, in total subjects as well as individually in males and females, a weak positive co-relation was obtained with stature. Since P value is ≤ 0.05 in total subjects and in males, which means it is found to be statistically significant. However, in females, P value is found to be statistically insignificant. [Table 1]

Fig 1: correlation between stature and nasal height of total subjects

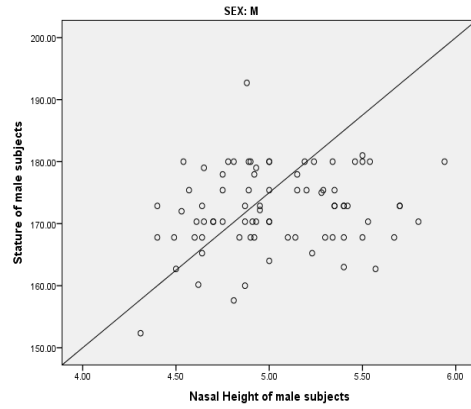

Fig 3: Correlation between stature and nasal height in males.

Fig 2: Correlation between stature and nasal height in females

Regression equation was formulated for total subjects as well as individually for males and females which can be used for calculating the estimated stature of that particular person once nasal height is known. [Table 2]

Table 2: Regression analysis for predicting stature (dependable variable) considering nasal height as independent variable	
Parameter	Regression equation for stature
Total subjects (n= 158)	$Y = 115.480 + 10.331 (\text{nasal height of subjects})$
Females (n= 79)	$Y = 151.170 + 1.662 (\text{nasal height of females})$
Males (n= 79)	$Y = 155.251 + 3.395 (\text{nasal height of Males})$

Considering nasal height of the subjects alone as an independent variable, sex can be differentiated as P value is ≤ 0.005 , which is statistically highly significant. This shows that statistically, sexual dimorphism exists

among the study population having a percentage of 8.5%. It was also observed that the findings are more accurate in females as compared to males i.e 77.2% and 68.4 % in females and males respectively [Table 3 & 4]

Table 3: Independent t test: for sex differentiation from Nasal Height						
Parameter	Sex	Mean ± SD	T value	P value	Significance level	% of sexual dimorphism
Nasal Height	M	172.3435 ± 6.48442	6.617	0.000	Statistically Highly significance	$\frac{X_m - X_f}{X_f} \times 100 = 8.5 \%$
	F	158.9430 ± 5.64269				
Xm = mean of male nasal heights, Xf = mean of female nasal height						

Table 4: % age accuracy to predict sex from nasal height using differential functional analysis	
Parameter	% age Accuracy
Total subjects	72.8%
Females	77.2%
Males	68.4%

Discussion

Various authors have estimated stature from cephalo-facial dimensions and found that it had partial positive correlation with total facial height, considering facial height as a better parameter.^{8,3,9,10,11} In this study, nasal height was used as a single parameter for estimation of stature. Except Shrestha RN et al¹² which has used solely, most of the authors^{13,14,15,16,17,18,19,20} have used nasal height in conjunction with other cephalo-facial parameters and similar findings of a positive correlation consistent with the present study have been obtained; the values being higher in males as compared to females. Though, few of the authors^{18,19,20} found nasal height to be un-reliable in stature estimation.

It is known that stature can be estimated either by multiplying the parameter with the derived multiplication factor or can be measured by employing regression equation, but most of the researchers considered that regression analysis is the best for stature estimation.^{3,13,14,21} However, in this study, the value of regression analysis is not found to be statistically significant in females but in males as well as when all the subjects are considered together, the value is significant. This disparity could be due to lesser number of subjects being studied and thereby research needs to be extended to a larger population.

In a study by Sagar S and Nath S²² nasal height is not considered to be a reliable parameter for sex differentiation but findings by E O Ewunonu²³ is consistent with the present study. The accuracy in predicting sex when mean nasal height is taken as independent variable is more in females as compared to males (F=77.2%,M= 68.4%) with percentage of sexual dimorphism being 8.5%; no author has commented in this regard.

Since, this study was conducted with intact soft tissue over the face, it is possible that the parameters may have insignificant correlation with bare bone measurements. These results can be of significance only in mutilated body with presence of some intact tissue or when isolated facial structure is brought for forensic examination. The regression equation thus obtained could prove to be beneficial in mass disasters as individuals that fall outside those limits can be easily excluded.

Conclusion

In circumstances where decomposed or mutilated body is brought for medico-legal examination, identification can be established by estimating stature by means of regression equation using nasal height. This produces a height range and individuals that fall outside

those limits can be subsequently excluded. Prediction of sex is also possible to a greater extent which can be used as an identification tool. This method is not only reliable, relatively easy and quick to apply without involvement of any sophisticated techniques but also the anatomical landmarks measured are standard, much easier to locate and does not require difficult instrumentation.

Study of Suspicious Deaths in Middle Aged Married Females

J. P. Kachhadia¹, S. B. Bhatt², V. R. Patil³

¹Tutor, ²Associate Professor, ³Professor & Head, Govt. Medical College, Baroda

Abstract

Introduction – Female deaths, especially young married females always arouse suspicions, but later age females who have crossed 30 years of age are not the cases which draws our attention. So, we conducted an observational study for a period of 1 year in autopsy of SSG Hospital, Baroda.

Material & Method – Of all cases coming for the postmortem examination, cases in which the victim is married female and above 30 years of age were taken for the study when there was suspicion regarding the cause of death.

Results – Victims having Illiterates (16.66 %), primary (45.83 %), secondary (33.33 %) school education were total 95.82 % of cases. It was observed that 72.91 % of deaths were suicidal in nature followed by accidental (22.91 %) and homicidal deaths (4.16 %).

Statistical analysis –The data collected was analyzed using MS Excel worksheets for averages and percentage.

Conclusion – Education holds a very pivotal role in the prevention of unnatural deaths in females.

Key-words – *Married females, suspicious death*

Introduction

In an autopsy whenever there is a case of married female for post-mortem examination, there is always suspicion raised by the family of the female. So, in every case of married female death we work extra cautious. Specifically, if the married female is young. But married females who are more than 30 years in age, these cases do not attract our great attention. So, to identify profiles and patterns in suspicious deaths in married females who are more than 30 years in age, current study was designed. The current study was undertaken at P.M. room of S.S.G. Hospital, Vadodara to study the profiles and patterns in suspicious deaths in married females of more than 30 years age group. Out of total cases coming from post-mortem examination total 48 cases were

selected based on inclusion, exclusion criteria.

Material & Method

An autopsy study of suspicious deaths in married females of above 30 years age was carried out in this Medical College from 1st August 2017 to 31st July 2018. A total 48 autopsy cases of unnatural deaths in married females with age more than 30 years were studied during the study period.

Inclusion Criteria:

The material for the present study consists of the cases of suspicious deaths of married female with age more than 30 years which have been brought for medico-legal autopsy.

Exclusion Criteria:

4. Deaths due to mass casualties or road traffic accidents.
5. Deaths due to natural disease.
6. Unidentified and Decomposed female dead

bodies.

Before performing autopsy, all these cases were studied in details from indoor case records, hospital records (where applicable), history obtained from relatives of deceased and police inquest. A standard proforma was used to collect information regarding age of deceased, duration since marriage, educational background of deceased and husband and types of family. A careful and complete autopsy was performed in each case. The viscera and necessary samples were preserved in required cases. Statistical analysis of data was done and presented as result and observation in tabular form, graphs and charts.

Statistical Method

The data so collected was tabulated and required calculations were done using MS Excel 2010. No other statistical method was required.

Results

Out of total 1925 autopsies performed in 1-year study period, 138 were females of all ages with suspicious deaths. From them 48 cases with age more than 30 years were selected as per inclusion, exclusion criteria. The results are as per tables below.

Table No.1: Distribution of cases according to age.

No.	Age of Deceased	No. of Cases	Percentage
1.	31-40 years	32	66.66 %
2.	40-50 years	12	25.00 %
3.	>50 years	4	8.33 %
Total		48	100 %

Maximum number (66.66 %) of deaths were observed in the age group of 31-40 years followed by 40-50 years (25 %).

Table No.2: Number of cases having children

No.	Deceased having children	No. of Cases	Percentage
1.	Yes	44	91.66 %
2.	No	4	8.33 %
Total		48	100 %

It was observed that 91.66 % of female victims had children while 8.33% female victims had no child.

Table No 3: Distribution of cases according to education of victim

No.	Education of Deceased	No. of Cases	Percentage
1.	Illiterate	8	16.66 %
2.	Primary	22	45.83 %
3.	Secondary	16	33.33 %
4.	Graduation	2	4.16 %
5.	Post-graduation	0	0 %
Total		48	100 %

Maximum number of married female deaths cases 45.83 % were observed in females having just primary or less education. Victims having Illiterates (16.66 %), primary (45.83 %), secondary (33.33 %) school education were total 95.82 % of cases.

Table No. 4: Distribution of cases according education of their husband

No.	Education of Husband	No. of Cases	Percentage
1.	Illiterate	10	20.83 %
2.	Primary	16	33.33 %
3.	Secondary	12	25 %
4.	Graduation	10	20.83 %
5.	Post-graduation	0	0 %
Total		48	100 %

Maximum number of suspicious deaths (79.83 %) in married females occurred where their husbands were poorly educated which include Illiterate (20.83%), primary (33.33 %), secondary (25 %).

Table No. 5: Distribution of cases according to cause and manner of Death

No.	Cause of Death	Manner of death			No. of Cases
		Accidental	Suicidal	Homicidal	
1.	Burns & its complications	6 (12.50 %)	10 (20.83 %)	0 (0 %)	16 (33.33 %)
2.	Hanging	0 (0 %)	10 (20.83 %)	0 (0 %)	10 (20.83 %)
3.	Poisoning	2 (4.16 %)	14 (29.17 %)	0 (0 %)	16 (33.33 %)
4.	Drowning	1 (2.08 %)	1 (2.08 %)	0 (0 %)	2 (4.16 %)
5.	Physical Assault	0 (0 %)	0 (0 %)	2 (4.16 %)	2 (4.16 %)
6.	Electrocution	1 (2.08 %)	0 (0 %)	0 (0 %)	1 (2.08 %)
7.	Snake bite	1 (2.08 %)	0 (0 %)	0 (0 %)	1 (2.08 %)
Total		11 (22.92 %)	35 (72.92 %)	2 (4.16 %)	48 (100 %)

It was observed that 72.92% of deaths were suicidal in nature followed by accidental (22.92%) and homicidal deaths (4.16 %). Total 20.83 % of deaths from burns were suicidal in nature, 12.50 % of burns were accidental.

Discussion –

An autopsy study of suspicious deaths in married females of above 30 years age was carried out in this Medical College from 1st August 2017 to 31st July 2018. A total 48 autopsy cases of unnatural deaths in married females with age more than 30 years were studied during the study period. During this one-year period a total of 1925 medico-legal autopsies were conducted, out of that 138 cases (7.16 %) were all age females with suspicious deaths. Which is comparable to what was reported by Shrivastava A.K.¹, Darji J.A.² et al (9.25%), Verma R.K.³ et al (7.74%) and similar to et al (4.95%). Out of which 48 cases (2.49%) were suspicious deaths of married female with age more than 30 years.

In the present study (Table No 1), Maximum number (66.66 %) of deaths were observed in the age group of 31-40 years followed by 40-50 years (25 %). The study conducted by Dere R.C.⁴ et al most common age group of unnatural death in females was 21-30 years (46.45%). Sharma B. R.⁵ et al noted that higher incidence (53.37%) of unnatural female deaths were in the age group of 21-23 years. The findings in the present study are consistent with the study carried out by Zine K.U.⁶ et al (41.30%). This may be due to the fact that the common age of marriage in our region and many regions all over India is 18 to 23 years and deaths due to torture and mental harassment by husband and in-law's in relation to dowry in newly married females occurs in initial few years of married life. Also, this is the most active period of life where the females are expected to perform work related to cooking and allied work hence are more prone to accidents during kitchen related activities.

In present study (Table No.2), It was observed that 91.66 % of female victims had children while 8.33% female victims had no child. As this study was in more than 30 years females & this might be due to after marriage there is a family and social pressure on the new couple for begetting child and one of the purposes of marriage is continuing the legacy of family.

In present study, (Table no. 3) Maximum number of married female deaths cases (45.83 %) were observed in females having just primary or less education. Victims having Illiterates (16.66 %), primary (45.83 %), secondary (33.33 %) school education were total 95.82 % of cases. It was clearly observed that as educational status rises in females, the death rate decreases. Present study is almost similar to Pankaj Prajapati⁷ et al Parmar V.N.⁸ et al, Zine K.U.⁶ et al and Darji J. A.² et al. This

might be due to the fact that female's professional is not dependent economically on their family members are less affected by violence and dowry death as compared to less educated females who are usually dependent on their family. Shrivastava A.K.¹ et al (37.76%) found that most of the females were educated up to primary school. Kulshreshtha P.¹ et al (50.42%) and Darji J.A.² et al (61.16%) found that most of the females were illiterate. This might due to change in lifestyle, socio-economic condition and population affected in that region and national capital. According to Zine K.U.⁶ et al. 72.3% victims were educated less than matriculation, reason for which may be dependence of less educated women on husbands and or in-laws and hence becoming victims.

In present study, (Table no. 4) Maximum number of suspicious deaths (79.83 %) in married females occurred where their husbands were poorly educated which include Illiterate (20.83 %), primary (33.33 %), secondary (25 %). It was observed that if the husband is educated then the deaths of married female deaths are less. The education of husband up to graduation level increases the chances of him becoming skilled worker and thereby increased chances of job opportunity. Also because of education, the person will be in position of taking proper decision with thinking rationally when conflict between family members arises.

From table No.5 it was observed that in accidental deaths in married female accidental burns was most common cause of death (37.50 %, 6 out of 16 accidental death cases). Quite different were noted by Buchade D.⁹ et al (62.02%). Accidental burns can be explained by females spending most of the time in kitchen and thereby coming in contact with fire following inadequate precautions while cooking on cooking gas, kerosene stove and open unguarded chulha. Wearing highly inflammable synthetic clothes, loose clothes like sari of the victims are highly susceptible to catch fire suddenly while cooking causing kitchen accidents. Also, the relatives of females might give the false history. In suicidal deaths, poisoning (40% - 14 out of 35 suicide cases) was most common followed by hanging (28.57 % - 10 out of 35 suicide cases) followed by burns (28.57 % - 10 out of 35 suicide cases) followed by Drowning (2.86 %). Similar findings were observed by Pankaj Prajapati¹⁰ et al in his study on pattern of suicidal deaths in females (35.51% deaths by poisoning, 31.16% by hanging). Easy availability of household and pesticidal poisons in rural population might be cause for these preferences. Likewise, easy availability of sari or dupatta, kerosene

and matchstick might be responsible for such trends in suicidal deaths by hanging and burns.

Quality of Life among Patients with Hypertension at Selected Tertiary Hospital In Kelambakkam, Kanchipuram District, Tamil Nadu, India

Lenin Ezhilarasu.J¹, Parasuraman. P¹, Sathiya priya.V²

¹B.Sc(N)student, IIIrdyear, ²Asst.Professor-Guide, Chettinad College of Nursing, Rajiv Gandhi Salai Kelambakkam, Kancheepuram ,District TamilNadu, India

Abstract

A descriptive study to assess the quality of life among patients with hypertension in a selected tertiary hospital at kelambakkam, kanchipuram District, Tamilnadu. The objectives were to assess the quality of life among patients with hypertension and to associate the quality of life of patients with hypertension and the selected demographic variables. 75 samples were participated in the study by using purposive sampling technique. WHO QOL - BREF tool was used to assess the quality of life among patients with hypertension. The study findings revealed that (52) 69.33% of the samples had low quality of life, (22) 29.33% of them had moderate quality of life and (1) 1.33% only had good quality of life. The results revealed that there is a statistical significance found between the Quality of life and selected demographic variables respectively age ($\chi^2=10.69$), weight ($\chi^2=4.34$), duration of hypertension ($\chi^2=3.79$) co-morbid condition ($\chi^2=0$). There is no statistical significant association found quality of life among patients with hypertension .

Keywords: *Quality of life, patients with hypertension.*

Introduction

Hypertension is a global public health issue and a leading cause of cardiovascular disease¹. Hypertension (HTN) exerts a substantial public health burden on cardiovascular health status and health care systems in India². HTN is directly responsible for 57% of all stroke deaths and 24% of all coronary heart disease (CHD) deaths in India³. One in three adults worldwide, according to the report, has raised blood pressure – a condition that causes around half of all deaths from stroke and heart disease⁴.

Global health report showed the prevalence of hypertension as 22% in the year 2014⁵. American Society of Hypertension and International Society of Hypertension 2013 reported that about 1/3 rd of

adults have hypertension in developed and developing countries⁶.

Quality of life (QOL) is the subjectively determined personal satisfaction with daily life, as influenced by the individual's evaluation of his/her physical, psychological, social, and spiritual wellbeing⁷. World Health Organization defines QOL as “an individual's perception of their position in life in the context of the culture and value systems in which they live, and in relation to their goals, expectations, standards and concerns”^{8,9}

In different studies conducted to assess the relation between QOL and hypertension, most of the studies reported lower scores in most dimensions as physical capacity, social functioning, mental health, psychological functioning, vitality as compared to general population^{10,11}.

From the above statistics it indicates that hypertension is an burning issue, for chronic diseases like hypertension assessing the quality of life can help in evaluating physical and psychosocial impact of the

disease on affected individuals.

Materials and Method

A Quantitative approach with descriptive design was used in the study. The study was conducted in medical ward in a selected Hospitals. A purposive sampling technique was used to select 75 samples with the following inclusion criteria viz. Patients with hypertension who are willing to participate in the study, who all are available during the time of the study and patients who can understand Tamil or English language.

Patients who are critically ill. Patients who have pregnancy induced hypertension were excluded from the study. Self-structured administered questionnaire was used to elicit the demographic variables and WHO-QOL BREF tool was used to assess the quality of life among

patients with hypertension and the score was interpreted as follows 0 - 50 - Low quality of life, 51 - 75 - Moderate quality life, 76 - 100 - Good quality of life.

Findings and Discussion

Frequency and percentage distribution of demographic variables of patients with hypertension.

Majority 42 (56%) were in the age group of 30 – 40 years, 39(52%) were females, 60(80%) of them were married, 26(34.66%) were having high school education, 27(36%) were moderate workers, 30(40%) were having normal weight, 39(52%) of them having hypertension since 1 – 3 years, 45(60%) were having co morbidities and 36(48%) were taking 1- 2 antihypertensive drugs to control hypertension .

Table.1 - Assessment of quality of life among patients with hypertension

Domains	Low quality of life		Moderate quality of life		Good quality of life	
	No	%	No	%	No	%
Domain – I physical	42	56	33	44	0	0
Domain – II psychological	43	57.33	32	42.66	0	0
Domain – III social relationship	53	70.6	19	25.33	3	4
Domain – IV environmental	48	64	27	36	0	0
Overall quality of life score	52	69.33	22	29.33	1	1.33

The above table reveals that, majority of the patients 52(69.33%) had low quality of life, 22 (29.33%) of them had moderate quality of life, 1 (1.33%) of them had good quality of life.

Table.2 - Mean and Standard deviation of quality of life of patients with hypertension.χ

S.No	Level of Quality of life	Frequency	Percentage	Mean	Standard Deviation
1.	Good quality of life	01	1.33%	44	10.67
2.	Moderate quality of life	22	29.33%		
3.	Low quality of life	52	69.33%		

Association of quality of life of patients with hypertension with demographic variables.

The Chi-square association revealed there was significant association between quality of life with selected demographic variables like Age ($\chi^2 = 10.69$), Weight ($\chi^2 = 04.34$), Duration of hypertension ($\chi^2 = 03.79$) and Co-morbidities ($\chi^2 = 0.7949$). Considering the other demographic variables like Gender ($\chi^2 = 33.08$), Marital status ($\chi^2 = 50.25$), Education ($\chi^2 = 15.23$), Occupation ($\chi^2 = 25.23$) and Number of anti hypertensive drugs ($\chi^2 = 13.32$) doesn't show any significant association.

Conclusion

Quality of life is important to everyone. The results of the study confirmed that the quality of life of patients with hypertension is impaired by assessing the four domains (Physical, Psychological, Social relationship, Environmental). So the health care professionals can create awareness regarding health promotion among hypertensive patients to prevent further cardiac diseases in patients with hypertension. Further studies can focus on the intervention that will improve the QOL of hypertensive patients.

Ethical Clearance - Ethical clearance was Obtained from Institutional Human Ethical Committee Chettinad Academy of Research and Education. Formal written permission obtained from the hospital authorities. Consent was obtained from each participants after explaining the procedure.

Effectiveness of Information Booklet on Knowledge, Practices and Willingness Regarding Recycling of Solid Household Waste Management among Residents

Seeta Devi¹, Roya Nemati², Petronella Natah², Rehu Rajan², Sumit Rane²

¹Asst. Professor, Symbiosis College of Nursing, Symbiosis International Deemed University, Pune,

²4th Year BSc Nursing, Symbiosis College of Nursing, Symbiosis International Deemed University, Pune

Abstract

Background: Pune is the 8th largest city in India and the 2nd largest in the state of Maharashtra. Population is about 4 million and the households are nearly 1 million.

Objective: To assess the effectiveness of information booklet on knowledge, practice and willingness of residents regarding recycling of household waste management.

Methodology: The research design was quasi experimental: pre-test post-test research design with the sample size 100 and used systematic random sampling technique. The structured questionnaire was administered. In order to establish the reliability of the tool inter rater method was used. The scores were calculated and reliability was established by Kappa method which was 0.80. The phases of data collection were informed consent was taken followed by the pretest and distribution of information booklet on recycling of solid household waste management to the residents and posttest was administered after 15 to 20 days of pretest and processed the data for analysis.

Results: t-test was used to check the effectiveness of the informational booklet on knowledge regarding recycling of solid household waste management among residents. t-value for this test was 27.4 with 99 degrees of freedom, corresponding p-value was of the order of 0.000, which is small (less than 0.05), the null hypothesis is rejected.

Conclusion: It was concluded that, the intervention which was provided to the residents was very effective in improving their knowledge, attitude and willingness towards the good practices of waste management at home.

Keywords: *information booklet, knowledge, practices, willingness, recycling, solid household waste management*

Introduction

The importance of cleanliness in our lives cannot be denied. A bad environment is solely responsible for spoiling the health of the people in the community around. Commonly used techniques of waste management are dumping, sanitary landfill, incineration, recycling, and composting etc.

Recycling is a process serves to transform the wastes into products of their own genre through industrial processing. Paper glass, aluminum, and plastics are commonly recycled. It is environmentally friendly to reuse the wastes instead of adding them to nature.

Waste is any substance that is considered not useful in the environment and can be harmful to human health .We have two types of waste which are solid and liquid waste, the solid waste consist of used plastic bags, damage home appliance, etc. whiles liquid waste consist of used water from bath, washing, decompose fecal matter and oil ¹

Pune is the 8th largest city in India and the 2nd largest in the state of Maharashtra with population about 4 million and the households are nearly 1 million. The area of Pune city is 250 sq. kms. There are 4 zones, 15 administrative ward offices and 76 Prabhags. Pune

generates about 1600 tons of solid waste per day. 160 trucks collect the waste door-to-door, collecting an average of 198 tons per day. 847 containers and 116 compactor buckets dispersed around the Pune. ²

Solid waste management plans by Authorities are Expansion of door step collection and sources segregation to entire city and for different waste streams, strengthen transport system (feeder, community, bin pick), create visible improvement in street cleanliness levels, ensure timely commissioning of waste processing and recovery capacity, stock holder participation and communication and establish robust complaint tracking and resolution system. ³

Working Nature of PMC Swachmodel a follows,

- A pair services door-to-door waste collections for 300-400 households.
- Segregated wastes expected but not always received from generators.
- Waste pickers further segregate waste and sell recyclables.
- Non-recyclables waste delivered to feeder point.
- Also provide compost services. ⁴

Besides the excellent services and efforts made by the PMC, many residents of our setting do not have adequate knowledge and practices of recycling of waste at the home. For instance, the PMC has given two dust bins to collect the dry and wet waste, but they are not used for waste collection by many residents, they are using them to keep provisions in the kitchen and residents were given muck to convert the household waste in manure for plants but there was no proper demonstration. It was surveyed in our previous descriptive studies. Now the investigators decided to educate the residents of our setting of the study in regard to recycling and waste management at home. ⁵

Title of the study

Effectiveness of information booklet on knowledge, practices and willingness regarding recycling of solid household waste management among residents

Objectives of the study

- To assess the knowledge, practice and

willingness of residents regarding recycling of household waste management

- To assess the effectiveness of information booklet on knowledge, practice and willingness of residents regarding recycling of household waste management

Methodology

In the present study, quantitative and evaluative approach was used. Research design was quasi experimental: pre-test post-test research design. Study was conducted in urban areas of Pune district. The sample size was 100 and systematic random sampling technique was used. The data was collected from the participants who were willing to participate in the study, and who were able to understand the English and Marathi. The structured questionnaire was administered. Questionnaire had four sections; Section I had demographic data of the residents with 5 items, Section II had assessment of knowledge regarding solid household waste management with 10 items, Section III had assessment of practice on solid household waste management with 19 items and section IV had, assessment of willingness of residents regarding solid household waste management with 10 items. In order to establish the reliability of the tool inter rater method was used. The score were then calculated and reliability was established by Kappa method which was 0.80. 11 experts in the field of specialty did validation of the tool. The data was collected in two months duration. The phases of data collection were, informed consent was taken from participants followed by the pretest and distribution of information booklet on solid waste management to the residents and posttest was administered after 15 to 20 days pre test and processed the data for analysis.

Results

Distribution participants based on demographic variables:

23% of the citizens had age 21-30 years, 41% of them had age 31-40 years, 21% of them had age 41-50 years and 15% of them had age 51-60 years. 54% of them were females and 46% of them were males. 46% of them were illiterate, 36% of them had primary education, 5% of them were graduates and 13% of them were post-graduates. 37% of them were employed, 33% of them were not employed, 13% of them were student and 17% of them were retired. 22% of them had income

less than Rs. 5000, 28% of them had income Rs. 5001-10000, 30% of them had income Rs. 10001-15000 and 20% of them had income more than Rs. 15000.

Table No 1: Effectiveness of the informational booklet on knowledge regarding recycling of solid household waste management

N=100

Knowledge	Pretest		Posttest	
	Freq	%	Freq	%
Poor (score 0-3)	53	53%	0	0%
Average (score 4-6)	34	34%	0	0%
Good (score 7-10)	13	13%	100	100%

In pretest, 53% of the citizens had poor knowledge (score 0-3), 34% of them had average knowledge (score 4-6) and 13% of them had good knowledge (score 7-10) regarding recycling of solid household waste management. In posttest, all of them had good knowledge (score 7-10) regarding recycling of solid

household waste management. This indicates that the knowledge of the citizens regarding recycling of solid household waste management improved remarkably after information booklet.

Table No 2: Paired t-test for the effectiveness of the informational booklet on knowledge regarding recycling of solid household waste management among residents N=100

	Mean	SD	t	Df	p-value
Pretest	3.8	1.9	27.4	99	0.000
Posttest	9.0	0.2			

Researcher applied paired t-test for the effectiveness of the informational booklet on knowledge regarding recycling of solid household waste management among residents. Average pretest knowledge score was 3.8 which increased to 9 in posttest. T-value for this test was 27.4 with 99 degrees of freedom, corresponding p-value was of the order of 0.000, which is small (less than 0.05), the null hypothesis is rejected. Knowledge of the citizens regarding recycling of solid household waste management improved significantly after information booklet.

Table No 3 : Effectiveness of the informational booklet on practices regarding recycling of solid household waste management among residents n=100

Practice item		Pretest	Posttest
Do you compost	Yes	41	35
	No	59	65
How many bags do you compost at home on your land with no cost to municipality	None	29	5
	1 bag per week	30	26
	2 bags per week	25	21
	3 bags or more per week	16	43
How do you manage dry waste? (Paper, plastic, etc.)	Burning	26	7
	Open ground	15	10
	Scraping	19	16
	Burn	40	19

	Dust bin	42	19
	Feed Animals	12	13
	Burn	25	42
How do you dispose sanitary waste	Burning	26	19
	Dustbin	74	81

Cont... Table No 3 : Effectiveness of the informational booklet on practices regarding recycling of solid household waste management among residents n=100

How do you dispose Electronic waste or E- waste	Dustbin	26	4
	Re-use	31	19
	Scarp	12	15
	Open	31	59
Which method do you use to segregate your waste	Dustbin	38	21
	Plastic bags	62	79
How often do you wash your dustbins	Daily	38	53
	Twice a week	34	20
	Thrice a week	21	10
	Weekly	7	17
Do you use recycling service	Yes	45	32
	No	55	68
If yes, how often do you use the services of recycling	Never	27	61
	Weekly	20	14
	Once a month	34	14
	Twice a month	19	11

Discussion

In the 2016, the researchers have conducted a similar study and it was discovered that due to lack of knowledge regarding house hold waste management, about 95.3% household waste was not collected systematically and reused it, which has developed to cause the insects and household infections, such as cholera ,pest bite infection, diarrhea, etc . It is also evident that some of this waste was dumped on the streets, gutters, holes and in nearby bushes causing environmental pollution.⁶

Even in our study, it was noticed that 53% of residents had poor knowledge regarding household waste management and after the intervention, their knowledge levels had been increased to an extent. It was also noticed that, the collection of the waste at home reduced about 45 % , which has proved that , the intervention which was provided to the residents was very effective in improving their knowledge, attitude and willingness towards the good practices of waste management at home.

Conclusion

Waste management activity is crucial to keep the environment clean and people healthy. As per the study results, it is provethe residents of urban community rated

PMC's waste collection and disposal services as good. The waste management technique adapted by PMC is commendable. It was noted that in urban community, waste lifters insisted on waste separation. The descriptive analysis also pointed out that the residents of urban community were satisfied with services of PMC. However, with the application of sustainable environmental education greater success ratio can be achieved.

A Study “To Assess the Level of Knowledge on Swine Flu Among Adults in Selected Area at Poonchery, Kanchipuram District, Tamilnadu

N.William Raj¹, R.Bhuvaneshwari¹, Shenbagaprabha.N²

¹III Year Student B.Sc Nursing, ²Assistant Professor, Department of Community Health Nursing, Chettiand College of Nursing, Chettinad Academy of Research and Education, Kelambakkam, Kanchipuram District, Tamilnadu, India

Abstract

The swine flu is a viral disease that is transmitted to humans, the swine flu is also known as pork flu virus belonging to the family Orthomyxoviridae which is endemic in population of pigs. A study to assess the knowledge on swine flu among adults in Poonchery, Kanchipuram District, Tamilnadu, India. The study was conducted with the aim to assess the knowledge on swine flu among the adults and to associate knowledge on swine flu with selected demographic variables between the age group of (18 years to 60 years). A study was conducted and the sample was consisted of a total of 50 adults. The tool used for this study was structured questionnaire. It results that 52% of them having Inadequate knowledge, 30% of them having moderate knowledge and 18% of them having Inadequate knowledge. The chi square value is 20.9862 ($P > 0.05$) S*, There is significant association between demographic variables. We have found that there is inadequate knowledge of adult population.

Key words : Assess ,knowledge, swine flu, adult.

Introduction

The current influenza outbreak of swine flu is a result of an influenza virus species that infected pigs, then re-assort (swap genes) and the new virus emerging. Currently there are four main influenza type A virus sub types, but the most recent influenza virus from pigs causing the outbreak have been H1N1 viruses. This new virus that has emerged is a mixture of swine, human and avian influenza viruses.¹

The swine flu is a viral disease that is transmitted to humans, the swine flu is also known as pork flu (any) virus belonging to the family Orthomyxoviridae which is endemic in population of pigs². These strain of viruses are known as swine influenza virus of SIV (the acronym in English of swine influenza virus have been classified into influenza virus C or are the subtypes of the genus influenza virus A (being the best known strain H1N1 isolated in Japan and Europe). Such genetic restructuring occurs regularly in nature and, at times, provides the virus with the capability of causing widespread disease in immunologic-ally populations. The virus can move swiftly across geographical borders to cause pandemics¹.

Statement of the Problem:

A study to assess the level of knowledge on swine flu among adults in selected areas at Poonchery, Kanchipuram District, Tamilnadu.

Objective of the Study:

1. To assess the knowledge on swine flu among the adults.
2. To associate knowledge on swine flu with selected demographic variables.

Research Methodology

- **Research Approach** : Non experimental approach.
- **Research Design** : Descriptive research design
- **Research Setting** : The study was conducted in the selected Community area Poonchery at Kanchipuram District, Tamilnadu

- **Population** : The population for this study in all adults who are residing at Poonchery village at Kanchipuram District.
- **Sample Size** : 50 adults.
- **Sampling Technique** : Simple Random Technique.

Results

SECTION-A: Frequency and percentage distribution of demographic variables of adults in assess the level of knowledge on swine flu among adults in Poonchery.

Age(years)in which majority (38%) were belongs to the age between 39-48 years.(18%) were in the age group of 49-60years.

Sex, in which majority (60%) of the samples were female and (40%) of samples were Male

Marital status, in which majority (58%) of the samples were unmarried.(3%) samples were divorced.

Educational status, in which majority(34%) of the samples belongs to the high school (10%)were in the graduate

Income, in which majority(60%) of the samples were Rs.5,000-10,000l (2%)were in the >15,000rupees

Types of family, in which majority(54%) of the samples werejoint family(46%)were in the nuclear family

Source of Information in which majority (36) of the samples belongs to the sources of knowledge from media. (14%)were in the television.

SECTION-B: Distribution of knowledge on the Swine Flu among adults in selected Village Poonchery.

The study finding revealed that the frequency distribution in the study shows that majority 52% of them having Inadequate knowledge,30% of them having moderate knowledge and 18% of them having Adequate knowledge on Swine Flu among adults.

SECTION-C: Association on knowledge on Swine Flu among adults with demographic variables:

Regarding association there is significant association of factors influencing knowledge on Swine Flu among adults with demographic variables like age, Sex,Marital Status,Education status,Income,Type of family and sources of information.

Summary

The finding of the study indicated that the knowledge plays an important role in the health of the community. It is a suitable method of instruction for the community health nurses for disseminating health information regarding swine flu, management and prevention of the pandemic swine flu. Educational interventions are

necessary to improve the knowledge. An improvement in the knowledge will lead to better practices, early identification of danger sign, initiation of appropriate treatment and prevention of the pandemic swine flu.

The Effectiveness of Video Assisted Teaching on Fire Safety among School Children at Selected School, Kanchipuram District, Tamilnadu

Moses Rathnakumar¹, Shruthi P¹, L.Lakshmi²

¹III Year B.Sc (Nursing) Students, ²Principal, Chettinad College of Nursing, Chettinad Academy of Research & Education, Kelambakkam, Kanchipuram district, Tamilnadu, India

Abstract

“A Quasi Experimental study to assess the effectiveness of video assisted teaching on fire safety among school children at selected school”. The objectives of the study were to determine the effectiveness of video assisted teaching on fire safety among school children at selected school and to find out the association between post-test knowledge score and selected demographic variables like Gender of students, Educational qualification of family, occupation, monthly income of family. The sampling technique used was simple random sampling technique with the samples of 100 school children. A validated questionnaire was used to assess the knowledge of the samples before and after administration of video assisted teaching programme on fire safety. An extensive review of literature with the guidance of experts formed the foundation to the development of questionnaires. The investigators used demographic variable Performa. The data collection tool was validated and reliability was established, the collected data was tabulated and analyzed. Descriptive and inferential statistics were used. The posttest mean value is 16.43 and the standard deviation 3.1 showed that the school children with adequate knowledge were 33%, with moderate knowledge 58% and with inadequate knowledge 9%. Hence health education for the school children was implemented to improve the children’s knowledge.

Key words: video assisted teaching, fire safety, fire safety among school children.

Introduction

Fire safety is a set of practices intended to reduce the destruction caused by fire. Fire safety measures include those that are intended to prevent ignition of an uncontrolled fire, and those that are used to limit the development and the effects of a fire after it^[1].

Fire safety measures include those that are planned during the construction of a building or implanted in structures that are already standing, and those that are taught to occupants of the building.

Threats to fire safety are commonly referred to as fire hazards. A fire hazard may include a situation that increases the likelihood of a fire or may impede escape in the event a fire occurs. Fire safety is often a component a building safety ^[2].

Those who inspect buildings for violations of the fire code and going to schools to educate children fire safety topics are fire department members known as fire prevention officers ^[3].

The chief fire prevention officer or chief or fire prevention will normally train new comers to the fire prevention division and may also conduct inspections or make presentations^[4]. Fire safety in schools is often a neglected element in many Indian schools and there are no rules that are set in place for checking this aspect.

The government does not enforce fire safety and most of the schools still function without even the basic safety amenities ^[5]. This has come to light recently in the fire disaster that was happened in Tamil Nadu.

Objective of the Study

To assess the pre-test and post-test knowledge level on fire safety among school children.

To find out the association between post-test knowledge score and selected demographic variables like gender of student, educational qualification of family, occupation, monthly income of family.

Hypothesis:

H1: There will be a significant difference between pre test score and post –test score knowledge secure prevention of fire safety.

H2: There will be a significant association between post-test knowledge of women regarding fire safety and selected demographic variables like gender of student, educational qualification of family, occupation, monthly income of family.

Research Methodology:

- Research approach: Quasi experimental research approach
- Research Design: Quasi-Experimental-Interventional research design
- Population: The Accessible Population of the present study is School children from 6thstd to 12thstd at selected schools at Kanchipuram District.
- The Sample size of 100 school children will be selected
- Research setting: The study will be collected in the Selected Schools at Kanchipuram District, Tamilnadu.
- Sampling Technique: Simple random sampling

Data Collection Procedure:

Permission to conduct the study was obtained from UG and ETHICAL committee.

Prior permission from the institution was obtained.

Informed consent was obtained from each sample.

The samples were given a questionnaire before administering the video assisted teaching programme

Video assisted teaching programme was conducted for 8 minutes

Post test knowledge level was assessed by readministering the questionnaire.

Results

The finding of the study was discussed under the following.

1. Assess the pre test of knowledge on practice of fire safety among school children.

The study result shows the level of knowledge of school children regarding fire safety that was assessed by structured questionnaire, analyzed using descriptive statics. It indicates that mean pre test knowledge score was 14.51 and standard deviation was 2.87.

2. Evaluate the video assisted teaching knowledge on practice of fire safety among

School children.

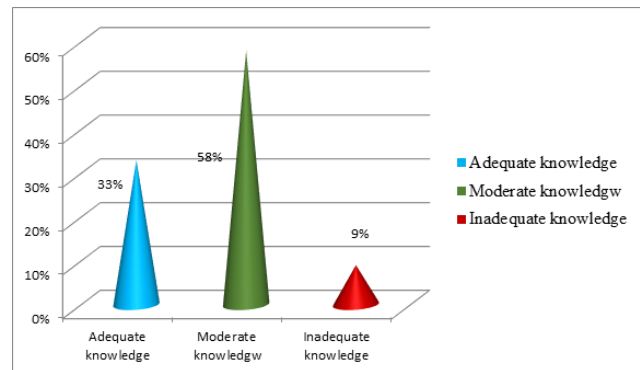

Figure:1 Distribution of post-test knowledge of video assisted teaching on fire safety.

Figure 1: shows the post test knowledge were having adequate knowledge 33%, moderate knowledge 58%, inadequate knowledge 9%, regarding the practice on fire safety.

3. Association of the post test level of knowledge on fire safety among school children with selected demographic variable.

As there was no significance association of post test knowledge score with selected demographic variable such as gender of student and occupation. In conclusion, the discussion of the study finding obtained by the researcher shows that there was a significant difference in the knowledge level on practice of fire safety after administration of video assisted teaching among school children.

Conclusion

This result from this study shows that the level of knowledge on practice of fire safety among school

children was moderate and adequate. This has to be taken into consideration. There may be some justifiable reasons for inadequate knowledge on fire safety among school children which can be improved upon.

Video assisted teaching is one of the effective methods in increasing the knowledge regarding practice of fire safety among school children. The findings of the shows a significantly increased post test level of knowledge scores after administration of video assisted teaching.

Lilliputian Neglected Happenings Call For Snafu: “Theory of Broken Windows”

Shyamantak Misra¹, Prabir Kumar Pattnaik²

¹Assistant Professor, ²Dean, Faculty of Legal Studies, Siksha ‘O’ Anusandhan University, Bhubaneswar, Odisha, India

Abstract

This article named “Lilliputian neglected happenings call for snafu” is a work focusing on the small things that are usually neglected and avoided during policing which further leads to hampering of peace and harmony in the neglected society or community thus giving a chance to the delinquents and offenders to foul up and create a chaotic situation. This work is inspired from the “Theory of Broken Windows” which was introduced by James Q Wilson and George L. Kelling in March 1982 in an article named “Broken Windows: The Police & neighborhood safety” in The Atlantic, retrieved 2007-09-03. This article first starts explaining the definition and origin of theory in general then how it reached its targeted audience and got popularized. The influencing power of the theory has been elaborately discussed, its theoretical tendency to revamp the policing methods have been stated and then the practical adoption of the theory by the New York police department and the consequences of the same have been enunciated. Finally the observation after through research works whether the theory is practically persistent or not has been deduced along with the concluding remarks.

Key words: *crime rate, social disorder, petty offences, environmental attitude, offenders*

Introduction

According to William J. Bratton, the former Police Chief of Los Angeles and New York City said that “If you take care of the little things, then you can prevent a lot of the big things.” In March 1982 James Q Wilson and George L. Kelling came up with the “Broken Windows Theory” in their article titled “Broken Windows” in the Atlantic Monthly.^[1] This theory dealt with the secret of persistent good management and maintenance through immediate replacement of the broken windows or other signs of disorder in order to prevent the criminals from assuming those signs as signs of weak social control, thus preventing omnishambles or a chaotic situation.

The theory was majorly targeted towards the policing trends and it tried to incorporate the methods

of immediate peeling of the onion, disposal hydra-headed instruments and other problems that usually goes unattended in a given environment and affects the peoples attitude towards the environment and leads to further aggravation of the matter but as a corollary to this theory if the problems are well tended as soon as they arise and swiped out from the roots using successful policing strategies thus restoring order in the society and reducing crime in our communities because April showers bring the May flowers .

However it is majorly a criminological theory that states the eye catchy signs of civil disorderliness, anti-social behavior or other criminal activities that gives scope to further create disorders including serious crimes.

Reaching the Targeted Audience and Getting Popularised:

Being one of the most cited articles the Broken Windows theory creates records in the history of Criminology. Since huge number of cities throughout the world has used Wilson and Kellings ideas under the

broken windows theory of policing as motivation for zero balance therefore it is also referred to as the Bible of policing wherein even the pettiest crimes are severely punished for.^[2]

Influencing Power of the Theory:

The broken windows theory has influenced the creation of Ontario's Safe Streets Act^[3] generated legal response to panhandlers, noisy neighbors and other forms of anti social behavior. Even By laws have been enacted through this act in order to curb the social and physical disorders. This theory of broken windows and its influence on policy and policing needs to be reformed due to the contentious approach that it has created and incorporated within marginalized neighborhoods. If it tries to strictly focus on solving the problems by engaging directly in dialogue with the communities then this broken windows theory would prove to be more effective on policies and policing.

Adoption of the Theory by The New York Police Department:

Closely following the Wilson and Kellings 1982 model^[4] the agencies first applied the broken windows theory of policing in several ways. However the most prominent way of adoption of this theory occurred in the New York City as an approach to crime and disorder. New York Mayor Rudolph Giuliani in 1990s enacted a policy whereby small crimes were targeted aggressively by the police and this message was channelized properly due to which a strong social signal was spread that "Crime isn't acceptable", thus, resulting in a significant fall of crime across the city.

Measuring The Broken Windows Treatment:

The best indicator of broken windows policing has been misdemeanor arrests since the data's are readily available and along with it the officers must also decide whether an arrest is appropriate or not. Therefore whether the New York Police Department was able to adopt this model successfully or not still remains open for discussion but it is very clear that its intervention is complex and evaluation would prove to be difficult. There has been much discussions on the impact of the adopted policing theory and the tactics on reducing crime and disorder. It has been stated by Eck & Maguire in 2000^[5] that the broken windows policing alone did not bring down the crime rates but it's also likely that police played some role.

Concequences of Applying The Theory:

Throughout the 1990s the broken window theory had an enormous impact on Policing and remained till the 21st century. It took a leap when the New York City applied the theory under the direction of William Bratton, police commissioner who believed in the theory and was convinced that the aggressive social order maintenance practices in the New York City Police Department were responsible for the drastic fall in the crime rates. William Bratton also translated the theory into practice as the Chief of New York City Police from 1990 -1992. Officers were assigned to catch hold of the social order breakers in squads wearing plainclothes without uniform which proved to decrease all kinds of crimes drastically.

Observational Deduction Whether the Theory is Persistent or Not? :

It is believed by most of the researchers on the broken windows theory that this theory has always worked better as an idea than as a description of the real world or when applied or adopted practically. The major problem in the theory is the inclusion of the perception that "disorders have more to do with the racial composition of a neighborhood than with the number of broken windows". Therefore we can deduce that it was persistent for a specific period only when it took a leap because of its practical adoption in New York City but when researches were made on the theory's practicability it was proved that it individually wasn't responsible for lowering the crime rates but along with it many factors worked simultaneously.

Indian Perspective:

Since the rate of petty offences is in diminishing order in India and the heinous crimes are increasing day by day so this theory won't be considered for practical application in India. Only when the situation demands for times when social disorder is at its peak and affecting the crime rate accordingly, necessary steps may be taken in order to apply the same theory if the rules, regulations and laws permit to do so. However the present situation demands stringent laws relating to heinous crimes in India and not the petty ones.

Conclusion

In brief the validity of the above theory is yet to be known, therefore it would be safe on my part to conclude that the broken windows theory even if valid does not state the explanation of all the components

that it involves. Further it is to be noted that it requires companion theories to explain the type of crimes and criminals that it would deal with. Unless more cities tend to adopt and experiment on the theory, the lacunas as well as the practicability cannot be precisely stated.

Ethical Clearance: Not required, as the research article is based on the relation between environmental attitude and petty offenders behavior. The research is doctrinally undertaken.

Self Determination and Indigenous People: The Fight For ‘Commons’

Swati Mohapatra

Assistant Professor, School of Law, K.I.I.T, Deemed to be University

Abstract

History has always seen the less-privileged as the one suffering the alienation of their rights, entitlements. It is equally true that these communities have fought back to claim what is rightfully theirs. The principle of Self determination or the right to decide how to be governed can be traced back to World War-1 and the principles laid down by Woodrow Wilson. This right to Self determination exists for each one of us. This becomes even more imminent when it belongs to a community which has its own preserved culture to protect, it has its own resources of which it is the foremost protector. Here the paper emphasizes how the tribals in India have now been reduced to a mere dependant and beggary. The paper traces the various changes of the Indian legal system governing the relationship between the ‘Commons’ and the Tribal Communities. But ‘the history of Forests is the history of conflicts’. The researcher has taken two case studies- the struggles of the Dongria-Kondhs of Odisha and the Sentinelese from Andaman, to show how these communities have in their own unparalleled ways protect their Commons from the never-ending appetite of the industrialization and human greed. Lastly, the researcher has analysed various provisions from the Corpus of Indian laws, to find out where is the State missing out. Along with it, the researcher has also suggested potential reforms to those laws, so as to guarantee the Tribals their “Right of Self Determination” in wholesome.

Keywords: *Commons, Self-Determination, Tribals, Indigenous People, Conflicts, Tribal Advisory Councils, Constitution.*

Introduction

“*A thing that we share and enjoy jointly*”(here after ‘Commons’), the significance of which has been taken from the way a mutual land was utilized among a commune in medieval Europe, i.e. ‘it was “held in common’.⁶ Absence of exclusive property rights except a right to enjoy the benefits out of it which is to be enjoyed by all in the community. This defies the conventional rules under the Transfer of Property Act, 1882 (Criteria for ownership is the mentioned Act which requires Right, Title and Interest over the property).

A community who is dependant on the forest resources, have a single forest shared by all. Also, the term ‘*khirkai/gaathan*’ brings forth the importance of this dependence⁷. The water bodies, resources (lac, resin, tendu patta), cremation grounds, connecting roads and other government created community assets are of utmost importance. The sharing and caring behaviour of such community people is important in the current times especially when the resources are depleting at an exponential rate, human beings are becoming greedier

day by day.

For the adivasis who make 8.6% of the total population” according to the “Census 2011 report”, secluded from the mainstream, consider these forests ‘safe haven’. Tribal communities have been enduring gradual disappearance of their original habitats and annihilation of their cultures through predatory involvement. Making them mere wage earners with uncertain and non-existent futures from self-sufficient owners of resources. There is one more dimension to it. A Senior Forest Officer of West Bengal mentioned in an interview that “the participation of the locals is one of the reasons for the increase in the forest cover.”⁸ It is important to highlight that the participation at the grass root level is essential for the environmental well-being and for the realization of tribal rights. The paper shall review the recent events which reflect how in the current times for the sake of economic growth the State has transformed itself protector has itself turned into ravisher of indigenous communities.

State's Rough-and-Tumble with Forest Community's 'Right To Exist' (Findings and Discussions)

Various propounders, starting from the great E.P Thompson⁹ to the Karl Marx¹⁰, have portrayed in their writings the hostility between the state players and the forest communities.

In India like most of its counterparts, the forest communities owned and shared their natural resources. 3rd of August 1865 brought an upheaval when the report of the then-in-charge of forests in Burma culled away rights of forest dwellers (tribal).¹¹ This initiated assertion of state monopoly rights over jungles. A law was enacted putting an end to the exclusive right of the indigenous people on the surrounding resources. Forests were now differentiated under The Scheduled Tribes and Other Traditional Forest Dwellers (Recognition of Forest Rights) Act, 2006 into: Reserved forests, protected forests. Baden Powell stressed here that "In olden days, native rulers used often to set aside considerable areas of forest land as hunting grounds." Colonial bureaucracy intentionally misused this practice from yesteryear turning those lands and its resources into the property of the Colonist through the rule of succession."¹²

The modern India carried forward its "British inheritance" by creating a department for Forests and keeping "The Indian forest act, 1927". The diminutive transition of such right from being an 'exclusive right' to mere concessions conferred by the 'state' has caused destructive displacement of unimaginable forest dwellers resulting in the destruction of the symbiotic relationship between nature and its people/protectors. The vices of getting benefited from the rich flora and fauna of the forest have substantially jeopardized the very existence of forest dwellers. They are in present deemed as trespassers to the forest and categorized as torch bearers of extremism. It is not a new concept but a hobby of the tyrannical government since time immemorial. Not only the centre, but the various state laws have been implementing amendments to antique laws constraining the rights of the tribals, in favour of industries and real-estates.¹³ The new law has widened the nature of the cultivable lands allowing use of land for suitable for the capitalists. Also by placing the said Law/s in the 9th Schedule of the Constitution, the Government has successfully tried to avoid judicial review.

In 2016, in a collusive bid between the Odisha Mining Corporation (hereafter, OMC) and the state

government (hereafter, Government), 1400 acres of forest area was to be diverted for iron ore mine.¹⁴ The state government successfully obtained a permission from the MoEF by including in the diversion proposition seven (exact) repetitive gram sabha resolutions. These proposals reflected a presumed free consent of the seven villages, and also expressing that they are not using the said lands for the purposes of agriculture, in-habitation, or any other sustenance. It was later found that all the seven proposals were actually so designed by a coterie of OMC and the Government.

DONGRIA KONDHS, ODISHA, INDIA

The Dongria Kondhs are one of the particularly vulnerable tribal groups of the State of Odisha. They consider the Niyama Hills as 'sanctum sanctorum', which defines their cultural, economic and social realities. These people proudly refer these hills as Niyam Raja as their God. "It is unthinkable to detach links between the tribes and forest"¹⁵. "The Government of Odisha agitated the lives of the indigenous people when it began to disport over 660 hectares of 'forest land' for mining by the a Mining Company in the districts which are one of the most resource enriched area of the State. What resulted next was nothing less than history. The battle was raised in forms of not-so-silent marches and rallies, the sounds of which reached from a tiny community in Kalahandi and Rayagada to the Wall Street and Madison Square. Their story was considered similar to that of the Na'vi Tribe of the Oscar winning movie Avatar. It is a matter of deep concern that the conventionally educated are still lagging behind to understand what Dongria Kondhs have realised and are much ahead in working on it by playing their own part in the larger scheme- Of saving biodiversity-rich forests of Niyamgiri. Thirty-eight water resources have their source-point from Niyamgiri hills and forests like this are a defence against climate change. No argument can be stronger when it is said that our Mother Nature is truly safer in the hands of the local people and that's the message they have sent out to the world. Dongrias are unaware about private ownership of resources because for them their community is everything. Here the Apex Court of India in the case of *Odisha Mining Corporation Limited v. Ministry of Environmental Forest Supreme Court of India, (Writ Petition (Civil) No. 180 of 2011)*, came upheld the customary and cultural rights of tribal community over Niyamgiri and right of self determination of the Indigenous People in accordance with the Forest Rights Act, Panchayat

(Extension to Scheduled Areas) Act, and provisions of the Constitution thus instilled the authority of the gram sabhas to protect customary habitats and cultural rights. The mining corporation has still built a refinery in the northern Part of the Niyamgiri hills. This has displaced a large number of indigenous. The land grants are limited to the people actually displaced. Not only this, the operation of the refinery has started affecting the surrounding. What would be very much welcome here is just and equitable rehabilitation package keeping in consideration the inflation indexed economic sustenance a land or house which must be market-price indexed. The Indian Law on Rehabilitation which is still in limbo could be brought into enforcement on a mission mode. Also, It is very much true that Maoist insurgency has established itself within the state of Odisha and the insurgents are looking for innocent residents of under developed areas for recruitment. So if State uses violence, then the tribal will not hesitate to retaliate.

Sentinelese, Andaman and Nicobar Islands, India

Best described as the world's last stone age tribe, the Sentinelese tribe of North Sentinel island of the Andaman and Nicobar Island, India. The country gained the recent limelight when an American national was killed when he tried to contact the said tribe. It has been alleged that he supposedly went with an object to preach the word of Jesus among the unapproachable part of the human community. The Sentinelese tribe, unlike its other counterparts, are devoid of any outside contact, except a few instances.¹⁶ "*The Andaman and Nicobar (Protection of Aboriginal Tribes) Regulation, 1956*" expressly "prohibits any kind of taking photograph/videos of aboriginal tribes; encroaching, hunting and poaching in reserve area and imposes an imprisonment of 3 years and fine". Any person who wants to enter into a reserved area can do so with a pass under the authority of the Chief Commissioner, following certain restrictions and conditions as provided under Section 7, The Andaman and Nicobar (Protection of Aboriginal Tribes) Regulation, 1956. This was brought in to force to maintain the pristine environment from the rapid pace of economic growth and the greed of the human race. The Andaman islands stands near to the world famous strait of Malacca which enjoys the distinction of being second busiest trade and tourism routes. This seemed to be a great opportunity for widening the tourism industry in the islands.

The government which has exercised the policy of non-intervention till 1991 by not even carrying the census survey, has now suddenly opened the closed doors of such a pristine tribe to the outsiders. Thus the Indian government removed the restrictions in 29 islands where the Restricted Area Permit mandatory under the Foreigners (Protected Areas) Order 1958.¹⁷ It is also important to stress here that the Indian citizens/tourist require no such permission. The Andaman Authorities have pursued to establish the direct sea path instead of reaching the islands through the Jarawa creek.¹⁸ The famous 'Jarawa creek' is a lonely planet in itself. It is the residing place of the primitive tribes, the population of whose have reduced to two-digit. Detached from rest of the planet, they are the marvel of the modern international. The Sentinelese have been categorized as one of the most untouched tribe, leading to their diminished immunity against external pathogen. The curiosity of few many so called new world inhabitants has led them to tread in to the dreadful. Not only the tribes, but the Island itself is so pristine surrounded by lucid waters, magnificent coral reefs and one of the most peculiar wetland of the world which is considered as a hot spot of wildlife inhabitants. It is essential to reiterate and stress upon the symbiotic relationship between the tribes and the environment in which they have sustained themselves.

The Stopping Point (Suggestions and Conclusion)

The current government has successfully ensured that the role of the adivasis are limited to tongueless stamps.

Hobbes in his book "*The Leviathan*" has explained that to escape from the harsh, brutish and unforgiving natural condition of the human beings, a central authority is imminent. It will aid the men to exist with other human beings in harmony as men by nature are war-mongering. But it should not be ignored that the Hobbes has missed out the wellfarist nature of the state, when he portrayed State only as a Brute Police Force. The state cannot limit its welfare policies to the dead-letters of Law. *The Panchayats (Extension to Scheduled Areas) Act 1996* entitles the people with a right of self rule, self determination. The principle of self rule was defied when the 'Restricted Area Permit' was removed with out any discussion or consultations with the inhabitants. It is also saddening enough to see that it was the State Government (the 'so-called protector') brought the plunderers (The Mining Corporation) to the

doorsteps of NiyamGiri Hills. Starting from Hobbes to the current day luminaries, all of them have stressed upon the idea of an individual bestowed with the control to decide any matter affecting him/her. This right being partially restricted under the Social Contract Theory (by Marsilius of Padua) does not devoid him of self determination. It is not arguable that the state believes in the concept of *Parens Patriae*. But the 'Parent' has to keep in consideration 'the best interests of the child' while taking any decision with respect to the child.

The Article 244 of the Constitution of India has instilled in the Governor and the Tribal advisory councils (TAC) with the duty to administer (control) the 5th Schedule areas. Now this may seem to be an epitome of a successful grass root level governance. But examining colonial acts of 1919 and 1935', the current provisions in Constitution are nothing but an old wine in a new steel (nearly unbreakable) bottle.¹⁹ The new law is more restrictive and control-centrist. The TACs are filled with systemic deficits: it is devoid of legislative or financial powers, 1/4th of the composition of the TAC are not characterized, a complete diminution of the role of the Governor from a constitutional authority to a mere annual-report writing body, plus the powers of the Governor are blurry. Here it is necessary to make these two bodies as strong and accountable in favour of the tribals. In the Memorandum to President Pranab Kumar Mukherjee, submitted by Adivasi Samanvay Manch, Bharat it was found that in most of the states, the Chief Minister's of the state are holding the chair of TACs and in many other areas, the Chairperson is a Non-ST. The decisions taken for the governance by these TACs and scheduled areas has to wait for the assent of the President, thus defeating the very objective of the grass root level governance. The Governor has to take decisions regarding the scheduled areas on the basis of the consultation with the TACs and not the Council of Ministers. Finally, the PESA Act, 1996, which granted autonomy in self governance to such areas, have been repeatedly non-implemented, and this has led to forceful implementation of the two-tier system of governance.

In light of the above whims and fancies of the Government, it is commendable to consider that the two tribes: the Dongria Kondhs and the Sentinelese, have in their own established incomparable ways have let the world know that they are not modern day colonies of the 'State', that they will do what they are required to do save their existence, their commons, their sanctorum. But at the end of the day, these groups do not fall on

the powerful side of the system. How long can they fight for their commons, with the limited resources they possess? The United Nation's 'Declaration on the Rights of Indigenous Peoples' stresses on the right of self determination, right of free, prior informed consent as a cardinal rule of Right to exist of the the Indigenous People. It is very essential to empower them, their agencies of governance by working in the following directions:

- i. Funding should be localized.
- ii. Giving clarity to the discretion of the Governors,.
- iii. The Governor of scheduled areas must rein their regulatory role and dispose it successfully in the favour of the deprived.
- iv. The TACs should have a better say and control on the funding and the implementation
- v. The Chairperson of the TACs must be a ST, who can better understand the problems of the tribals.
- vi. A strong political push to work out the enforcement in the favour of the communities on a mission mode

The indigenous are the essence of our motherland. We trace our culture, customs, existence from them. It is a matter of great shock that the fore-moving engine of growth and development is failing to carry on within it the greatest stakeholder. The Government, the civil society and the communities themselves have to come together to make this symbiotic functioning of governance, growth and successful human existence a reality.

A Descriptive Study to Assess the Knowledge on Fast Food Eating among Adults in Selected Urban Community Kanchipuram District Tamil Nadu

T. Yaazhini¹, K.Vishwanathan¹, N.S Shakthivel¹, M.Yagajyanthi²

¹B.Sc(N) III year, ²Associate Professor, Chettinad Academy of Research and Education, Chettinad College of Nursing, Kelambakkam, Kanchipuram district, Tamil Nadu

Abstract

The fast food industry had its beginning around the mid-twentieth centuries and it grew tremendously during the last three decades of the twentieth century. The fast-food eating cause heart disease high blood pressure and diabetes mellitus and high risk of health problem such as obesity. The objectives of the study is to assess the knowledge level on fast food eating among adults and to find out the association between the knowledge and demographic variables of adults. A purposive sampling technique is used to collect data from the sample. The samples size was 50 adults at selected urban community. The knowledge level was assisted by self structured questionnaire. The result shows 1(2%) of sample had inadequate knowledge, 18(36%) of sample had moderately adequate knowledge 31(62%) of sample had adequate knowledge regarding fast food eating. There was a significant association between the knowledge and age of adult and there is no significant association between the other demographic variables like gender, income, education, resident and number of times eating fast food per week.

Key Words: Assess, Knowledge, Fast food , Adult.

Introduction

Fast food has appeared in the world during ancient Rome age, Indian introduced dahi vad, vadapav, and panipuri. Fast food is which is easily processed food served in snack bars and restaurant as a quick meal or to be taken away. Fast food are characterized as quickly easily accessible and cheap alternatives to home cooked and meals they also tend to be in high in Saturated fat sugar salt and calories. Fast food outlets a number of which offers drive through service fulfill a need for today's often over-scheduled society. The fast food industry had its beginning around the mid-twentieth century, and it grew tremendously during the last three decades of the twentieth century.³

The fast food eating causes heart disease high blood pressure and diabetes mellitus. You elevate your risk of health problem such as obesity whenever you eat fast food meals according to a 2007 article in "The New York Time Health Guide "People find it convenient to eat such as food items which please the taste buds more than regular food. They contain no nutritional value and are extremely unhealthy but still fast food items are popular as people find fast food items are popular as people find it hassle free to prepare and consume. Adults and children nowadays eat fast food without its effects on the body and general health, therefore we shall realize the nutritional value of what we eat in order to understand whether we need it or not.⁴

About junk food discussing of its, reasons of rapid spread all around the world, its harmful effects, and the possible solution for that problem. There are many examples of junk food such as pizza, French Fries, Burgers, Hotdogs, Fried food, candy, ice cream, and soda pop. Others kinds of junk food are just like the imitation juice that you find nowadays in most of the markets, and so little of the pure natural juice.⁷

Advantages of fast food is that it can save money, save time and when it comes to disadvantages he quality of fast food is low, more fattening. When fast food enters our body it will lead to fatigue, constipation, bloating, increase in obesity risk but you will be starving, and increase in cancer, heart and liver diseases risk, your memory and cognitive functions will decline, skin will start deteriorate, kidneys and stomach will suffer more, Teeth will start decaying, blood sugar and cholesterol increases, mental health may be affected. ⁶

Need for the Study

Fast food is an affordable and convenient way to fill stomach when on the urge. Although people won't feel guilty for an occasional indulgence, regularly eating fast food can seriously damage health. Coupled with low nutritional value, the high fat, calorie and sodium content of these foods can lead to a variety of health problems. With statistical associations to weight gain, obesity, diabetes, cardiovascular conditions and all-cause mortality.¹

A study was conducted in Srinagar, Jammu & Kashmir aimed to enhance the knowledge of adolescents regarding effects of junk foods on health and in turn to reduce the incidence of consumption of junk foods by adopting healthier eating habits. A pre-experimental study was conducted using one group pre-test post-test design. The findings of the study revealed that knowledge level of adolescents regarding effects of junk foods is inadequate and there is a great need to improve this knowledge. In pre-test knowledge score 47(59%), were having inadequate knowledge, 33(41%) were having moderately adequate knowledge and no one was reported to have highly adequate knowledge about effects of junk foods on health. ²

Women who are more fast food and less fresh fruits took longer to conceive. Fast food may affect fertility because of its high saturated fat content. Women who eat more fast food spend longer trying to get pregnant, while those who eat more fruit conceive more quickly, It's one more finding adding to evidence that a healthy diet can help make people more fertile.⁵

Methodology

Research Approach

Quantitative descriptive approach was used for the study. The present study was conducted to assess the

knowledge on fast food eating among adult at selected urban community, Kanchipuram District, Tamil Nadu .

Research Design

Non-experimental descriptive research design was used.

Research Setting

The study was conducted in a urban community, karapakkam

Population

The populations of the study to assess the knowledge on fast food eating among adults

25-50 years of age residing in selected community area, Kanchipuram district, Tamil Nadu

Sample Size

The sample size used was 50 adults residing at karapakkam.

Sampling Technique

Non randomized purposive sampling technique was used for the present study.

Sampling Criteria

A) Inclusion criteria

- o Adult age between 25-50 year of age
- o Adult who are present at the time of data collection
- o Adult who can understand Tamil or English

B) Exclusion criteria

Adult who are not present at the time of data collection

Development and Description of the Tool

The tool was developed by the researchers on reviewing literature and in consultations with medical and nursing experts in the field of community medicine and nursing.

Description of the Tool

The tool consist of two sections

Section-A: Demographic variables like age, gender, occupation, income, education, residence and number of times eating fast food.

Section-B: Modified questionnaire to assess the level of knowledge of fast food eating among adults

Tools consist of 15 questions with choices regarding fast food eating where correct answer is given 1 score and the others are given 0 score

Method of Data Collection:

The data was collected by using self-structured questionnaire a method.

Statistical Analysis

The descriptive statistics mean, percentage is used to assess the knowledge on fast food eating among adults. Chi square was used to find out the association between the adults knowledge and demographic variables.

Results and Discussion

Fig 1:Percentage Distribution of population based on level of knowledge.

According to the level of knowledge on fast-food eating 1(2%) of population were having inadequate knowledge 18(36%) of population were having moderate knowledge and 31(62%) of population were having adequate knowledge.

The study finding revealed that the

- **Age:** majority (56%) were in the age between 25-33 years, (30%) of them between 34-44 years and (14%) of them between 45-50 years.
- **Gender:** majority of 27(54%) were belongs to male and 23(46%) of the female.
- **Monthly income:** majority (46%) were earning above Rs.10,000, (40%) of them were earning

Rs.5000-10,000 (15%) of them were earning below Rs.5000

- **Educational qualification:** majority (36%) were graduates, (28%) have completed their higher education (20%) of them have completed secondary education (8%) have completed their primary education education and (8%) of them are illiterate.
- **Resident:** majority 84% of them stay in house,12% stay in hostel and other 4% stay as paying guest
- **No of times eating fast food per month:** majority 50% eat 3-4 times,24% 1-2 times and 18% eat more than 5 times and 8% never eat.

Conclusion

We have conducted a research topic on a Descriptive Study to Assess the knowledge on fast food eating among adults in a selected urban community , Kelambakkam, Kanchipuram district, Tamil Nadu, India.

A Three Year Study of Skull Fracture Patterns in Fatal Road Traffic Accidents in a Tertiary Care Hospital Mortuary in Imphal From 2015-2018

Th. Meera Devi¹, Memchoubi Ph.², Haobijam Rita Devi³

¹Professor and Head; ²Associate Professor; ³PGT; Dept of Forensic Medicine and Toxicology, Regional Institute of Medical Sciences, Imphal

Abstract

Fatal road traffic accident cases with skull fractures were studied for three years from July 2015 to June 2018 from the medicolegal autopsy cases coming to the Mortuary of the Regional Institute of Medical Sciences, Imphal. The patterns of skull fractures in various types of victims involved in accidents with different types of vehicles were analyzed in detail. It was observed that skull fractures were encountered most commonly in pedestrian victims. Of the various types of skull fractures, comminuted fracture was observed in maximum number of cases (31.5%). Preventive and interventional measures in the form of wearing helmets by two wheeler riders, strict implementation of traffic rules and prompt emergency services especially neurosurgery facilities which can help in reducing the incidence of road traffic accident fatalities are suggested.

Key words: Road traffic accidents, incidence of victims, skull fracture patterns

Introduction

Road traffic accident (RTA) is a collision between vehicles; between vehicles and pedestrians; between vehicles and animals; or between vehicles and geographical or architectural obstacles. Road traffic accidents are human tragedy. They involve high human suffering and socioeconomic costs in terms of premature deaths, injuries, loss of productivity, and so on.¹

According to Ministry of Road Transport and Highways Transport Research Wing, Govt. of India, New Delhi, the total number of road accidents increased by 2.5 per cent from 4,89,400 in 2014 to 5,01,423 in 2015. The total number of persons killed in road accidents increased by 4.6 per cent from 1,39,671 in 2014 to 1,46,133 in 2015. Road accident injuries have also increased by 1.4 percent from 4,93,474 in 2014 to 5,00,279 in 2015. The severity of road accidents, measured in terms of number of persons killed per 100 accidents has increased from 28.5 in 2014 to 29.1 in

2015. The analysis of road accident data 2015 reveals that about 1,374 accidents and 400 deaths take place every day on Indian roads which further translates into 57 accidents and loss of 17 lives on an average every hour in our country.³ Road traffic injuries are currently estimated to be the ninth leading cause of death across all age groups globally, and are predicted to become the seventh leading cause of death by 2030.

Cranio-cerebral injuries are responsible for more than one-fourth of all traumatic deaths and nearly two-third of road traffic accidents. Incidence of head injury is steadily rising all over the world. The burden is serious as majority of head injury victims belong to young and productive age group.⁴

The present study has been undertaken at the department of Forensic Medicine of a tertiary care teaching hospital in northeast India, to assess the pattern of skull fractures in relation to the type of victim to help in evaluating the method of prevention of head injuries in road traffic accidents.

Materials and Method

After obtaining approval from the Institutional ethics Board of the institute, a retrospective study was

undertaken in the Department of Forensic Medicine tertiary care teaching hospital in northeast India, from July 2015 to June 2018. Only cases of head injuries due to vehicular accidents were included in the study. Cases where fatal head injury is associated with fatal injuries on other parts of the body, both of which having jointly contributed towards the death were also included in the study. Decomposed bodies were excluded from the study. Details of the victim, type of vehicle involved, nature of the accident and time of occurrence were obtained from the post mortem report and the inquest papers. Statistical analysis was done at the end of the study to evaluate the findings in term of percentages, to determine the difference in the pattern of craniocerebral injuries between the type of victims and vehicles involved.

Results

During the period of July 2015 and June 2018, medico legal post-mortem examinations of 667 cases were conducted in the mortuary of Forensic Medicine department of Regional Institute of Medical sciences, Imphal. Out of these 667 cases, 236 (35.38%) were cases of fatal road traffic accidents. In these 236 cases of the fatal road traffic accidents (RTA), head injuries were observed in 133 (56.35%) cases and 103(11.29%) cases had no head injuries, as shown Table 1.

From the various types of road users in this series, the maximum victims of fatal RTAs having head injuries were pedestrians (30%) followed by motorcyclists (24%) and drivers of 3 or 4 wheelers and occupants of 3 or 4 wheelers with (15% each). The detailed findings are shown in Table 2.

Out of those 133cases, 94 (70.67%) cases had fractures of skull either in vault or base or in both. Vault and base fracture combined was seen in 57 (42.85%) cases had vault and base fracture and 26 (19.54%)

cases had only vault fracture and 11 (8.27%) cases had only base fracture. In 39 (29.32%) cases the skull was found to be intact. Table 3 show the details. All these cases had scalp injuries in forms of abrasion, contusion, laceration, or haematoma singly or in combination with other injuries.

Of the various types of skull fractures, comminuted fracture was observed in maximum number of cases in this series constituting 42 (31.5%) cases followed by fissured fracture seen in 26 (19.54%)cases, crushed fracture in 9 (6.76%) cases, depressed and depressed comminuted fracture in 7 (5.26%) cases each and sutural fracture in only 5 (3.75%) case. Table 4 illustrates the different types of skull fractures.

Most of the pedestrians sustained fissured fracture of the skull (33.3%) followed by comminuted fracture (26.7%) and crushed fracture (6.7%). On the other hand, majority of the motorcyclists (41.7%) sustained comminuted fracture of skull followed by fissured fracture (25%). Interestingly, pillion riders of two wheelers commonly sustained comminuted fracture (44.4%). Comminuted fracture was also observed in 33.3% each of the drivers of 3 or 4 wheeler and occupants of 3 or 4 wheelers. This is illustrated in Table 5.

Table 6 illustrates the site of skull fracture in relation to the type of victims. In the skull fracture sustained by pedestrians, maximum bone to be involved singly was temporal bone (13.3%). It was followed by frontal, temporal + occipital bone seen in 4(13.3%) cases. Motor cyclists and occupants of 3 or 4 wheelers had skull fractures with involvement of all the skull bones i.e. 20.8% 13.3% respectively. Drivers of 3 or 4 wheelers and pillion riders had maximum involvement of fronto temporal bone as seen in 3 (20%) cases and 2 (22.2%) cases respectively. While cyclists had maximum involvement of parietotemporal bone (20.8%).

Table 1: Showing incidence of victims with and without head injuries in 236 fatal RTA cases

Category of victims	No. of cases	Percentage
Cases with head injuries	133	56.35%
Cases without head injuries	103	11.29%

Table 2: Showing the types of victims.

Types of victim	No. of cases	Percentage
Pedestrians	37	27.81%
Cyclists	9	6.7%
Motorcyclists	30	22.55%
Pillion riders	13	9.77%
Drivers of 3 or 4 wheelers	22	16.54%
Occupants of 3 or 4 wheelers	22	16.54%
Total	133	100%

Table No.3: Showing incidence of fracture of vault, base and combined

Fracture site	No. of cases	Percentage
Vault only	26	19.54%
Base only	11	8.27%
Vault and Base	57	42.85%
Intact	39	29.32%
Total	133	100%

Table 4: Showing different types of skull fractures

Types of fractures	No. of cases	Percentage
Fissured #	26	19.54%
Comminuted #	42	31.57%
Depressed#	7	5.26%
Depressed comminuted #	7	5.26%
Sutural #	5	3.75%
Crushed #	9	6.76%
Intact	36	27.06%
Total	133	100%

Table 5: Showing types of skull fractures in relation to types of victims

Types of victim	Types of skull fracture							
	Fissured # (%)	Comminuted # (%)	Depressed # (%)	Depressed Comminuted # (%)	Sutural # (%)	Crushed # (%)	Intact (%)	P.C (%)

Drivers of 3 or 4 wheelers (22)	4 (26.6%)	3 (20%)	1 (6.7%)	0	0	7 (46.7%)
Occupants of 3 or 4 wheelers (22)	3 (20.1%)	0	0	0	2 (13.3%)	3 66.6%

Discussion

In this present study, out of 667 medico legal autopsy, 236 were of fatal road traffic accidents accounting to 35.38 %. These findings are similar to the studies done by Chavali K H et al⁶, Das D K,² and Sharma B R et al⁵, which showed that vehicular accidents comprised less than 36% of the total medico-legal autopsies.

Out of 236 fatal road traffic accident (RTA) victims, 56.35 % of victims (133 cases) died due to head injuries. This findings is almost similar with the findings of Arora S et al¹⁵, Gouda SH et al⁷, Rahman MA et al¹², and Emara AM et al¹⁰. They also reported incidences of head injuries in fatal RTAs as above 50%.

Pedestrians (27.81%) followed by motorcyclists, (22.55%) constituted the majority of the victims. Similar findings were found by Sharma BR et al⁵, Chavali KH et al⁶, Gupta S et al⁹, and Kumar S et al¹³ in their studies. This may be due to the fact that in our set up majority of the road users are pedestrians and two wheelers. Their lack of traffic sense, ignorance of traffic rules, craze for speed, lack of proper footpath and presence of vendors and other commercial installations by the side

of the roads, etc. make pedestrians and motorcyclists prone to RTA. However Kadam SS et al¹⁴ found drivers, Gouda HS et al⁷ found motorcyclists and Rahman MA et al¹² found occupants of vehicle to be the common victims involved in RTA.

Literature says that in one of four fatal head injuries, skull escapes fracture.¹⁶ The presence of skull fracture is an indication of the severity of force applied. In contrast to the vault, the base of the skull presents many jagged areas. The relative movement of the brain against the skull results in more damage to its inferior surface or base. In the present study, 94 (70.67%) cases had skull fractures. 57 (42.85%) cases had vault and base fracture and 26 (19.54%) cases had only vault fracture and 11 (8.27%) cases had only base fracture. In 39 (29.32%) cases the skull was found to be intact. Gouda HS et al⁷ and Nair SS et al¹⁵ also found that vault and base combined fracture was more than vault and base fracture alone, whereas many authors Arora S et al¹¹, Rahman MA et al¹², Gupta S et al⁹ found vault fracture to be more common than base and vault-base combined fracture.

In this study, of the various types of skull fractures, comminuted fracture was observed in maximum number of cases in this series constituting 42 (31.5%) cases followed by fissured fracture seen in 26 (19.54%) cases, crushed fracture in 9 (6.76%) cases, depressed and depressed comminuted fracture in 7 (5.26%) cases each and sutural fracture in only 5 (3.75%) case. However, Modi A D et al⁴, Gupta S et al⁹ and Kumar S et al¹³ found fissured fracture to be the commonest of all the skull fractures. It may be because this type of fracture is more common in cases where the head strikes by forcible contact with a broad resisting surface, as in road traffic accidents.

In the present study, majority of the motorcyclists (41.7%) sustained comminuted fracture of skull followed by fissured fracture (25%). Interestingly, pillion riders of two wheelers commonly sustained comminuted fracture (44.4%). But several authors viz. Shivakumar BC et al¹⁷, Ravikumar R et al⁸, Kumar S et al⁵ found linear fracture the commonest amongst the motorcyclists and pillion riders.

In the skull fracture sustained by pedestrians, the bone most commonly involved singly were temporal and frontal bones (46.6%). Maximum workers viz. Arora S et al¹¹, Modi AD et al⁴ and Gupta S et al⁹ found that temporal bone was the most commonly fractured single bone of the skull in RTAs. Motor cyclists had skull fractures with involvement of the frontal bone (29.1%) cases. Cyclists had maximum involvement of parieto-temporal bone (57.2%), which is consistent with the findings of Arora S et al¹¹ who found parieto-temporal to be the most commonly fractured bone in combined form.

Conclusion

Head injury due to road traffic accidents often leads to fatal outcomes. In the present study, fatal head injuries in road traffic accidents are relatively high in pedestrian victims compared to the other road users. This emphasizes the need for measures to ensure the safety of pedestrian road users. Wearing helmets by two wheeler riders, strict implementation of traffic rules and prompt emergency services especially neurosurgery facilities can help in reducing the incidence of road traffic accident fatalities.

Intracranial Meningioma Aggressivity Image and Level of Malignancy in Head Magnetic Resonance Imaging (MRI)

Vony Tjandra¹, Sri Andreani Utomo², Ulinta Purwanti³, Dyah Fauziah⁴, Hari Basuki⁵

¹Department of Radiology, Faculty of Medicine - Dr. Soetomo General Hospital, Universitas Airlangga, Surabaya 60285, Indonesia, ²Neuroradiology Division, Department of Radiology, ³Department of Radiotherapy, ⁴Department of Anatomical Pathology, Faculty of Medicine, Universitas Airlangga - Dr. Soetomo General Hospital, Surabaya, ⁵Department of Biostatistics and Population, Faculty of Public Health, Universitas Airlangga

Abstract

Background: Meningioma is the second most common central nervous system neoplasm in adults, usually benign that originally from arachnoid cap cells. Meningioma is categorized by WHO classification as benign (grade I), atypical (grade II), and anaplastic (grade III). **Objectives:** This study to know strong correlation between the image of intracranial meningioma aggressiveness and malignancy. **Method:** Restrictively, forty-intracranial meningiomas of new cases who had undergone surgery from January 2014 to June 2015, preoperative MRI head examination and Anatomy Pathology at Dr. Soetomo Surabaya, observed signs of aggressiveness of meningioma and malignancy rate that analyzed by contingency coefficient and Spearman correlation coefficient. **Results:** Based on age 30-65 years; 82.5% of women and 17.5% of men was got a strong correlation between bone destruction ($C = 0.533$); weak association of intratumoral cystic changes ($C = 0.230$), hyperostosis ($C = 0.327$), vascular encasement ($C = 0.327$); a very weak correlation of extracranial tumor extension ($C = 0.139$), cerebral peritoneal edema ($C = 0.104$); with a malignant degree in meningioma. **Conclusion:** There was a strong correlation between bone destruction and malignancy rates in meningioma.

Keywords: Intracranial meningioma, malignancy, MRI, nervous system

Introduction

Meningiomas are the second most common central nervous neoplasm in adults and most are usually benign, while, slow-growing tumors derived from arachnoid cap cells. Atypical and malignant meningiomas are more common in men. They are rarely present in patients under 40 years old and increase in suspicion of type 2 neurofibromatosis (NF2) in young adults 1–3. NF2 tumor suppressor genes have been found to mutate in large portions of meningioma 4.

The incidence of meningioma every year was 2.3 for each 100,000, increased by age, and peak in the 7th decade 5. In the United States from 2002 to 2006 the meningioma frequency reached 33.8% of all primary tumors in the brain and central nervous system 6. Two

studies indicated that the incidence of meningioma in Asian races was lower than in European, however other study reported there was no significant incidence of race-based incidence, with 20.8%, 18.5%, and China 16.6% 7.

There are many subtypes of histologic meningiomas differ in levels of malignant behavior. The most commonly used that WHO classifies are three classes, which have different prognostic properties 8. Meningiomas were categorized by WHO classification as benign (grade I), atypical (grade II), and anaplastic (grade III), 80%, 15-20%, and 1-3% of all meningioma 5. respectively. Grade I tumors that do not meet the criteria for higher grade lesions, grade II tumors with increased mitotic activity (≥ 4 mitosis per high power field), Grade III tumors with ≥ 20 mitosis for each high power field and/or malignant characteristics that resembling carcinomas and sarcoma 9,10.

Previous studies reported that retrospective studies in 75 patients undergoing intracranial meningioma resection were performed to determine the correlation

between aggressive imaging features and histopathologic classes in meningioma¹¹. Six aggressive imaging were evaluated: intratumoral cystic changes, adjacent cranial hyperostosis, bone destruction, extracranial tumor extension through skull base foramina, vascular encasement and peritumoral cerebral edema. Fifty-nine tumors were classified as benign, according to WHO classification and 16 as atypical/malignant. Only intratumoral cystic changes and extracranial tumor extension through the skull base foramina are more prevalent in atypical/malignant meningiomas^{11,12}.

Most meningiomas have a good prognosis, frequent surgery, and curative adjuvant radiotherapy. Although, total resection is not always possible because meningiomas might enclose vascular and neural structures, and radiation therapy is limited by neurotoxicity and tumor size. Until now, chemotherapy regimens have minimal effectiveness in the treatment of meningioma¹². The prognosis worsens with worse differentiation of the tumor^{13,14}. MRI can be used as classification process according to type of brain disease such as Glioma, Alzheimer's, and Carcinoma¹⁵. In cases with intracranial pathology, MRI is an examination option for diagnosis and characteristic of meningioma. When the picture and location are typical, the diagnosis is made to a higher degree¹⁴. Advances in identifying alternative forms of therapy for these patients have been limited by poor understanding of the molecular pathogenesis of meningiomas and molecular critical changes encouraging tumor growth, and by the lack of meningioma cell lines and tumor models for preclinical studies¹⁶. Therefore, this study aims to look at the picture of intracranial meningioma aggressiveness in head MRI with malignancy rate.

Method

The cross-sectional study was used with the samples all patients of intracranial meningioma of new cases that have been operated and performed MRI preoperative head examination and Anatomy Pathology in Dr. Soetomo General Hospital Surabaya from January 2014 to June

2015. Data were taken from head MRI examination data that using GE Optima 360 1.5 Tesla engine and Anatomy Pathology examination data (MIRSA) from patients with intracranial meningioma of new cases that have been operated in Dr. Soetomo General Hospital Surabaya. The head MRI examination was re-read by 2 neuroradiologists using the Osirinx system to saw signs of aggressiveness of meningioma and then associated with the results of Anatomical Pathology. Data from MRI preoperative head examination and Anatomy Pathology examination result (MIRSA) were collected for observation, and data were analyzed with contingency coefficient and Spearman correlation coefficient using SPSS 21 (SPSS, Inc., Chicago, IL.).

Results

The sample was 40 people, drawn from the total sample size of patients diagnosed with intracranial meningioma of newly operated cases and performed preoperative head MRI examination also anatomical pathology examination at Dr. Soetomo General Hospital Surabaya.

Frequency of Malignancy Rate

Table 1. Frequency of meningioma malignancy

Grade Meningioma (WHO)	Frequency	Percentase
Grade 1	34	85.0
Grade 2	5	12.5
Grade 3	1	2.5
Total	40	100.0

From the results, Table 1 showed WHO grade 1 meningioma was 34 patients (85%), WHO grade 2 was 5 patients (5.5%) and WHO grade 3 was 1 patient (2.5%).

*Patient Characteristics***Table 2. Distribution of patient age according to malignancy rate of meningioma.**

Age	Grade Meningioma (WHO)						Total
	1		2		3		
30-<40	6	(85.7%)	1	(14.3%)	0	(0.0%)	7
40-<50	17	(85.0%)	3	(15.0%)	0	(0.0%)	20
50-<60	10	(90.9%)	1	(9.1%)	0	(0.0%)	11
>60	1	(50.0%)	0	(0.0%)	1	(50.0%)	2
Total	34	(85.0%)	5	(12.5%)	1	(2.5%)	40

The patient's age has a mean of 47.05 ± 7.21 years. The youngest patient was 30 years old while the oldest was 65. The highest prevalence was in the 40 to 49-year-old group. Table 2 showed the age distribution of patients according to meningioma malignancy. From the study, it was found that at the age of 30-60 years old, the incidence of WHO grade 1 meningioma was more commonly obtained. While at the age of 60 years was a tendency of WHO grade 3 meningiomas.

Table 3. Sex distribution of patients according to meningioma malignancy level.

Sex	Grade Meningioma (WHO)						Total
	1		2		3		
Male	4	(57.1 %)	2	(28.6 %)	1	(14.3%)	7
Female	30	(90.9%)	3	(9.1%)	0	(0.0%)	33
Total	34	(85.0%)	5	(12.5%)	1	(2.5%)	40

The sex of patients women were 33 patients (82.5%) more than men 7 (17.5%). It was also found that in female patients had a tendency to meningioma WHO grade 1, while grade 3 occurred in men

Overview of Meningioma Aggressiveness on Preoperative MRI Examination that Correlated with Anatomical Pathology Results

The data was taken when one of the observer/assessor express positive, hence the picture of aggressiveness meningioma considered as positive.

Table 4. Meningioma aggressiveness on preoperative MRI examination that correlated with anatomical pathology

Correlation	Diagnostics Grade 1		Grade meningioma (WHO)			Total
			Grade 2	Grade 3		
Correlation of intratumoral cystic changes with meningioma aggressiveness level	Intratumoral cyclic changes	-	21 (61.8%)	2 (40.0%)	0 (0.0%)	23 (57.5%)
		+	13 (38.2%)	3 (60.2%)	1 (100%)	17 (42.5%)

Cont... Table 4. Meningioma aggressiveness on preoperative MRI examination that correlated with anatomical pathology

Total			34	5	1	40 (100%)
Correlation of hyperostosis with aggressiveness of meningioma	hyperostosis	-	28 (82.4%)	2 (40.0%)	1 (100%)	31 (77.5%)
		+	6 (17.6%)	3 (60.0%)	0 (0.0%)	9 (22.5%)
Total			31	5	1	40 (100%)
Correlation of bone destruction with aggressiveness of meningioma	Bone Destruction	-	33 (97.1%)	3 (60.0%)	0 (0.0%)	36 (90.%)
		+	1 (2.9%)	2 (40.0%)	1 (100%)	4 (10%)
Total			34	5	1	40 (100%)
Correlation of extracranial tumor extension with aggressiveness of meningioma	Extracranial tumor extension	-	30 (88.2%)	5 (100%)	1 (100%)	36 (90%)
		+	4 (11.8%)	0 (0.0%)	0 (0.0%)	4 (10%)
Total			34	5	1	40 (100%)
Correlation of vascular encasement with level of aggressiveness meningioma	Vascular encasement	-	23 (67.6%)	5 (100%)	1 (100%)	29 (72.5%)
		+	11 (32.4%)	0 (0.0%)	0 (0.0%)	11 (27.5%)
Total			34	5	1	40 (100%)
Correlation of peritumoral cerebral edema with aggressiveness of meningioma	Peritumoral cerebral edema	-	9 (26.5%)	1 (20.0%)	0 (0.0%)	10 (25%)
		+	25 (73.5%)	4 (80.0%)	1 (100%)	30 (75%)
Total			34	5	1	40 (100%)

Based on Table 4, there was a weak correlation between the presence of intratumoral cysts with meningioma malignancy ($C = 0.230$). A weak correlation between the presence of hyperostosis with meningioma malignancy ($C = 0.327$). Strong relationship between the existence of bone destruction with meningioma malignancy ($C = 0.533$). There was a very weak correlation between extension of extracranial tumor and malignancy rate of meningioma ($C = 0.139$). Weak relationship between the vascular encasement with malignancy rates meningioma ($C = 0.327$). There was a very weak correlation between peritumoral brain edema with malignancy rate meningioma ($C = 0.104$).

Total Aggressiveness Score

Table 5. Total aggressive image score of meningioma with malignancy level

Grade Meningioma (WHO)	n	Aggressive score			rs
		Median	Minimum	Maximum	
Grade 1	34	2	0	5	0.130
Grade 2	5	1	1	3	
Grade 3	1	3	3	3	

Table 5 showed that the results were a very weak correlation between the image of aggressiveness meningioma with malignancy rate meningioma ($r_s = 0.130$). In meningioma WHO grade 1 was 0-5 features (average 2 features) description of aggressiveness meningioma, WHO grade 2 was 1-3 features (average 1 feature) and WHO grade 3 was 3 features.

Discussion

Forty-patients diagnosed intracranial meningioma that performed surgery and examination of head MRI pre-operative and Anatomy Pathology examination. The patients have a mean of 47.05 ± 7.21 years. The youngest patient was 30 years old and the oldest was 65 years old. The highest prevalence in the age group 40-49 years was 20 patients (50%), whereas in the age group 30-39 years was 7 patients (17.5%), age group 50-59 years was 11 patients (27.5%) and age group over 60-year-old was 2 people (0.05%). In this study obtained female patients was 33 patients (82.5%) more than men by 7 patients (17.5%).

Meningiomas were categorized by WHO classification as benign (grade I), atypical (grade II), and anaplastic (grade III), 80%, 15-20%, and 1-3% of all meningiomas^{5,17}. From this research, there was 34 men (85%) of WHO grade 1 meningioma, WHO grade 2 was 5 (12.5%) and WHO grade 3 was 1 (2.5%). Based on age obtained there were; at age 30-59 years was 33 patients with WHO grade 1 intracranial meningioma and 5 patients with WHO grade 2 intracranial meningioma, also in the age group over 60 years old was 1 person with WHO grade 1 and 1 men intracranial meningioma with WHO grade 3 intracranial meningiomas.

Meningiomas are generally more common in women, with the dominance of 2-3 to 1, but this trend is reduced in atypical and anaplastic meningiomas in children and radiation-induced meningioma¹⁷. Based on sex, women were more likely to suffer from WHO grade 1 intracranial meningioma by 30 patients (90.9%) and 3 (9.1%) with WHO grade 2 meningiomas. In men, 4 (57.1%) patients were WHO grade 1, 2 (28.6%) intracranial meningioma with WHO grade 2 while 1 men (14.3%) intracranial meningioma with WHO grade 3 intracranial meningiomas. In this study, there was 1 men's meningioma of WHO grade 3 intrauterine with male sex and in the age group over 60 years old.

A retrospective study of 75 patients undergoing intracranial meningioma resection was performed to

determine the correlation between aggressive imaging features and histopathologic classes in meningioma¹¹. Six aggressive imaging features were evaluated: intratumoral cystic changes, adjacent cranial hyperostosis, bone destruction, extracranial tumor extension through skull base foramina, vascular encasement and peritumoral cerebral edema. Fifty-nine tumors were classified as benign, according to WHO classification, and 16 as atypical/malignant. Only intratumoral cystic changes and extracranial tumor extension through the skull base foramina are more common in atypical/malignant¹¹. From the analysis, there was a strong correlation between bone destruction and meningioma malignancy ($C = 0.533$). While on other features have a weak correlation between the picture of aggressiveness meningioma with meningioma malignancy levels, cystic intratumoral changes ($C = 0.230$), hyperostosis ($C = 0.327$) and vascular encasement ($C = 0.250$). And there is a very weak association between the aggressive picture of meningioma and meningioma malignancy, extension of extracranial tumor ($C = 0.139$) and peritumoral cerebral edema ($C = 0.104$).

The presence of an overview of intratumoral cystic changes was in 13 patients from 34 individuals (38.2%) with WHO meningioma grade 1, 3 patients from 5 (60%) with WHO grade 2 meningiomas and 1 patient from 1 (100%) with WHO meningioma grade 3. From the results, there was a weak correlation between the existence of intratumoral cystic changes with meningioma malignancy.

The presence of hyperostotic features was in 6 of 34 patients (17.6%) with WHO meningioma grade 1, 3 patients of 5 (60%) with WHO grade 2 meningioma and 0 patients of 1 (0%) with WHO grade 3 meningiomas. The results, there was a weak correlation between the presence of hyperostosis with meningioma malignancy.

Bone destruction was present in 1 out of 34 patients (2.9%) with WHO meningioma grade 1, 2 of 5 patients (40%) with WHO grade 2 meningiomas and 1 of 1 patients (100%) with WHO grade meningioma 3. From the results, there was a strong correlation between the existence of bone destruction with meningioma malignancy. Extracranial tumor extension features were present in 4 of 34 patients (11.8%) with WHO meningioma grade 1, 0 of 5 patients (0%) with WHO grade 2 meningiomas and 0 of 1 patients (0%) with WHO meningioma grade 3. From the results, that there was a very weak correlation between the extension of the

extracranial tumor with malignancy rate meningioma.

Vascular encasement was present in 11 of 34 patients (32.4%) with WHO grade meningioma 1, 0 of 5 patients (0%) with WHO grade 2 meningiomas and none of 1 patients (0%) with WHO grade meningioma 3. From the results, there was a weak correlation between the vascular encasement with the malignancy rate of meningioma ($C = 0.327$). Peritumoral brain edema was present in 25 of 34 patients (73.5%) with WHO meningioma grade 1, 4 of 5 patients (80%) with WHO grade 2 meningiomas and 1 of 1 patients (100%) with WHO meningioma grade 3. From the results, there was a very weak correlation between peritumoral brain edema with malignancy rate meningioma ($C = 0.104$). From the total score of aggressive images of meningioma was a very weak correlation between the picture of aggressiveness meningioma with meningioma malignancy ($r_s = 0.130$). Meningioma WHO grade 1 has 0-5 features (average 2 features) meningioma aggressiveness picture, WHO grade 2 meningioma has 1-3 features (average 1 feature) description of aggressiveness meningioma, and meningioma WHO grade 3 has 3 features aggressiveness picture meningioma.

Conclusion

There was a strong correlation between bone destruction and malignancy rates in meningioma. The presence of a weak association of the aggressive features of meningioma was intratumoral cystic changes, hyperostosis, and vascular encasement with malignant levels in meningioma. The presence of a very weak correlation from the image of aggressive meningioma extension of extracranial tumor and peritumoral brain edema with malignancy levels in meningioma. From the total score of aggressive images of meningioma, there was a very weak correlation between the picture of aggressiveness meningioma with meningioma malignancy.

Practice and Perceived Barriers among Health Care Workers to Control Infection in Dialysis Unit

Jackline Prathibha¹, Daisy Josphine Lobo², Shalini G Nayak³, Vandana KE⁴

¹Lecturer, MSc Nursing, ²Associate Professor, MPhil Nursing, Medical Surgical Nursing, ³Assistant Professor, MPhil Nursing, Medical Surgical Nursing, Manipal College of Nursing Manipal, Manipal Academy of Higher Education, Karnataka, India, ⁴Professor, Department of Microbiology, Kasturba Medical College, Manipal Academy of Higher Education, Karnataka, India

Abstract

Aim: Study investigated the practices and perceived barriers towards infection control measures among healthcare workers in the dialysis unit.

Method: Descriptive survey design was adopted. Data was collected by administering checklist on barriers towards infection control measures in dialysis unit among 50 healthcare workers and 602 events on infection control measures in dialysis unit was observed using observation checklist.

Findings: The study findings revealed that majority of healthcare workers perceived that wash basin for hand washing is away from patient area, lack of appropriate staffing, high work load, washing agents cause irritation to my hands, nobody checks, too busy, not following infection control measures in dialysis unit as the barrier and healthcare workers were not following all the infection control measures in dialysis unit.

Conclusions: This study indicates that majority healthcare workers did not follow infection control measures in dialysis unit. It is alarming and mandates the need for reinforcing the healthcare workers to follow the infection control measures which can prevented healthcare associated infections in the unit. Healthcare associated infection are the most common cause preventable infections in patients undergoing dialysis.

Key words: Infection Control nursing, dialysis, practice, barriers, healthcare workers, hand hygiene, hospital infection management, reuse.

Introduction

Patients on dialysis treatment has an increased risk for acquiring an infection because of the nature of complex dialysis process requiring frequent use of vascular access. Dialysis patients have weakened immune system which increases their risk for infection¹. Approximately 2,250,000 patients worldwide are on maintenance dialysis². In 2013, there were 9,09,000 Asians on dialysis³. Total admission rate in dialysis

patient among Asians is 1,248. Mortality rate by primary cause of mortality in Asians septicemia is 6.5%, viral infections is 0.1% and 1.0% are other infections⁴. Dialysis patient and Healthcare Workers in the dialysis unit are at greater risk of blood borne pathogens such as Hepatitis C, hepatitis B and human immunodeficiency virus. As the disease is not a curative but life sustaining patients undergoes dialysis in same centre for years repeatedly and also patients usually may have to be dialysed in three or four shifts everyday were in the unit of healthcare workers also go through the periods of extreme activity during which after termination of one shift of patients the next shift have their treatment would be initiated. In most of the dialysis unit the dialysis machine and patient bed are placed in proximity to each other along the walls and also the hand washing basins are usually located at a distance in the facility hence the

risk of transmission of these blood borne pathogens is more outpatient dialysis centres⁵. Therefore, the present study was conducted to assess the practices and barriers regarding infection control measures among healthcare workers in dialysis unit which in turn helps to reduce the transmission of infections by enhancing their awareness regarding infection control measures to be followed in dialysis unit which will also help to bring down the infection rate.

Material and Method

After approval from Institutional ethics committee with informed consent, 602 events of practice towards infection control measures in dialysis unit were observed and the barriers were assessed among all the health care workers available during data collection. The total number of events required for the observation of practice was calculated using estimation of proportion formula. The study was registered with the clinical trials registry - India (CTRI) No CTRI/2017/03/008109. The inclusion criteria were healthcare workers working in dialysis unit during period of data collection and willing to participate in the study. The checklist was validated and tested for reliability. The reliability obtained for observation checklist (0.97), resource checklist (0.93) and perceived barriers checklist was (0.96) thus the tools were reliable.

The researcher observed the practices among healthcare workers of dialysis unit regarding infection control measures using an observation checklist and resources necessary to practice infection control measures in the dialysis unit using resource checklist. Self-administered checklist was used to assess the barriers on infection control measures in dialysis unit after obtaining the informed consent. To interpret the collected data descriptive statistics were used. The data were analysed using Statistical Package for the Social Sciences (SPSS) version 16.

Findings

Barriers to infection control measures among healthcare workers were assessed (Table 1). Among 50 healthcare workers, majority of healthcare workers 32 (64%) perceived that wash basin for hand washing is away from patient area was the one of the barrier towards infection control measures in dialysis unit, 30 (60%) perceived that lack of appropriate staffing as the barrier, 29 (58%) perceived that there was high work load, 19 (38%) Washing agents cause irritation to hands, 16 (32%) nobody checks whether I follow infection

control measures or not, 5 (10%) I am too busy, I can't follow infection control measures in dialysis unit as the barriers. Other barriers expressed by the participants were staff shortage, no separate eating room for patients, lack of organisation, more number of patients, less dialysis machines, sometimes forget guidelines and protocols, busy in the night duty, busy due to increased workload, feel uncomfortable to wear goggles during the procedure, adhesive plasters and ointments are not designated to each patients, lack of appropriate staffing due to continuous ward change for senior staff, inadequate slippers, there is no sphygmomanometer for each block, no separate isolation room, no regular classes for newly joined staffs, no needle puncture resistance container for each block.

Practice towards infection control measures in dialysis units were: Out of 92 events of setting dialysis machine, priming of dialyser and tubing, majority 92 (100%) events they did not remove the gloves after setting the machine, 91 (99%) times did not perform hand hygiene after setting machine, 81 (88%) events had put on new, clean gloves before setting the machine, 88 (96%) mask was worn properly and 70 (76%) performed hand hygiene before setting the machine and 67 (72%) performed hand hygiene after priming.

During 92 events of arteriovenous fistula/ graft cannulation and dialysis tubing connection, most 89 (97%) connects cannula to arterio venous tubing aseptically, 65 (71%) contaminated fistula/ graft site after antisepsis and 54 (59%) did not perform hand hygiene before arteriovenous fistula / graft cannulation, and 33 (36%) did not perform hand hygiene after arteriovenous fistula / graft cannulation and dialysis tubing connection.

Out of 92 injectable medication preparation events majority 92 (100%) of the events, medication preparation in bedside medication trolley with sterile tray and medication was not prepared aseptically instead the medication was prepared on the same dressing set which was used for cannulation and decannulation which was placed on the bedside multipurpose cardiac board, 84 (91%) hand hygiene was not performed before injectable medication preparation.

In total of 92 events, majority 72 (78%) disconnects from blood lines aseptically, 66 (72%) do not performs hand hygiene before arteriovenous fistula / graft decannulation, 38 (41%) dressing were not applied aseptically as they did not use sterile gloves and touched

unsterile equipment's before applying dressing with sterile gloves and 41 (45%) did not perform hand hygiene after the arteriovenous fistula / graft decannulation and dialysis catheter disconnection, 15 (16%) of the events they did not put on new, sterile gloves as per the technique instead used the same gloves which was used for arteriovenous fistula / graft cannulation and connection, 15 (16%) times needles were not removed aseptically because they did not use the sterile gloves while removing the needle during arteriovenous fistula / graft decannulation and dialysis catheter disconnection and after removing needles were placed on the bed of the patient which was carried with the gloved hand and disposed in the resistance puncture container in the dialysis unit after the procedure.

During 92 events of termination of dialysis, majority 86 (93%) times priming bucket has not been emptied and the same bucket was used for another patient and 70 (76%) of the events the tubing and dialyzers were not placed in a leak-proof container instead it was carried to reprocessing area with the gloved hand and 44 (48%) hand hygiene were not performed after termination of dialysis.

During 92 events of reprocessing dialyser and tubings, majority 92 (100%) times health care workers wore personal protective gear like gloves and plastic aprons but goggles and mask were not used all the time, 92 (100%) tubings and dialyser was stored in sealed polythene bag and 82 (89%) times dialyser was backwashed for 15 minutes direction of flow reversed in 5 minutes was not done after reprocessing dialyser and tubings, removal of glove and hand washing need to be done after reprocessing of dialyser and tubing of each patient but 77 (84%) times hand hygiene after reprocessing of each dialyser and also tubings was not done instead gloves was removed after each shift and hand hygiene was done and the reprocessing operator as

per hospital policy and guidelines is dialysis technician but reprocessing was done by class four workers and all the tubings and dialyser of different patients which was supposed to be reprocessed separately was not reprocessed separately instead were dumped in the same base and reprocessed.

Out of 25 events of cleaning and disinfection, most 25 (100%) dialysis bed was not disinfected after each patient with 1% hypochlorite, 25 (100%) disinfection of the reusable jugs for sodium bicarbonate using 1:100 dilution bleach at least weekly and priming bucket disinfection with 1:100 bleach were not done, 23 (92%) monitors were not disinfected with virkon 1% 4 times a day, 21 (84%) all high touch surfaces were not cleaned.

Resources present in the dialysis unit were observed (Table 2).In dialysis unit hand rub solutions were available at every patients bed side, disinfectants gluteraldehyde solution, hypochlorite solution, virkon solutions, hydrogen peroxide were available all the time 25 (100%), wash basins to wash hands available near the entrance of dialysis unit with two wash basins and are adequate as they was no overcrowding found near wash basins for washing hands, sufficient supply of hand washing solutions as hand washing solutions were present all the time 25 (100%), sterile gloves supplied adequately, mask, cap, gown, goggle for eye protection, disposable syringes, hand rub available in the medication trolley sufficient sterile dressing packs adequately supplied 25 (100%), 13 (52%) times hand rub was not present in all medication trolley, 23 (92%) times povidin iodine was not present in all medication trolley, 20 (80%) AHD solution not present in all medication trolley, 7 (28%) times spirit solution present in all medication trolley biomedical waste bins were in every cubical but puncture resistant container to dispose fistula cannula was not present in all cubicles.

Conclusion

The study found that majority healthcare workers did not follow infection control measures in dialysis unit though they had good knowledge. Hence, it is essential and necessitates the need for reinforcing the healthcare workers to follow the infection control measures to prevent healthcare associated infections in the unit as healthcare associated infection which are the biggest cause of avoidable harm and unnecessary death in the health system. The policy for infection control measures need to be strictly followed in the dialysis unit. All the facilities and equipment that are required for applying infection control measures should be available in the setting. It is very much essential to assess the barriers which hinders the healthcare workers in practicing infection control measures which in turn helps in reducing the practice of care and prevent the healthcare associated infections in the dialysis unit.

Abstract

Background: The profile of medico legal autopsy cases is important in order to know the death statistics in a region due to unnatural causes and also help to address the demographic needs according to the mortality statistics specific to that region.

Materials and Methods: The present study is a retrospective study of autopsies performed at KAHER'S tertiary care centre K.L.E Hospital, Belagavi, Karnataka India in the year 2017. During this period a total of 159 autopsy cases were conducted. Relevant information and subjective data like age, sex, marital status & manner of death have been collected from medicolegal autopsy register from January 2017 to December 2017.

Results: Out of 159 cases analyzed, maximum number of autopsies were in the age group of 21-30 years with 55 cases(34.6%). Majority of victims were males 118(74.2%). Hindus were majority in number with 147 cases(92.6%), married were 122(76.7%) & unmarried were 37 cases(23.3%). In our study 67.9% were rural residents & only 32.1% were urban. Accident, Suicide and Homicide deaths were 110(69.2%), 37(23.3%)& 1(0.6%) cases respectively. Natural deaths were seen in 6.9% cases. Maximum number of deaths were due to road traffic accidents with 92 cases (57.9%) followed by poisoning with 27 cases (17%). Out of total 159 cases maximum number of autopsy cases 60(37.7%) were conducted in the month of April to June.

Conclusion: In our present study it is observed that maximum cases were in 3rd decade of life, Males outnumbered females, rural residents were more in number. Hindus being majority formed bulk of cases. RTA, Poisoning & burns were seen as leading cause of death & maximum deaths were in the second quarter of the year (April, May & June).

Keywords: Medicolegal Autopsy, Road traffic accidents, Poisoning

Introduction

Worldwide 55.3 million people die each year^[1]. About 5.8 million people die each year as a result of injuries. This accounts for 10 % of the total deaths.

Deaths due to unnatural causes includes road traffic accidents, railway accidents, mechanical asphyxia, drowning, accidental fire, electrocution, air crash, stampede, mines disaster, deaths during pregnancy, killed by animals, illicit liquor, snake bites and food poisoning.^[2]

Corresponding Author-

Dr. Somashekhar S Pujar,

Associate Professor, Department of Forensic Medicine and Toxicology, KAHER'S J.N Medical College, Belagavi-590010

The rate of unnatural death in India is 39.2 per 1000 live birth per year, while the rate of unnatural deaths in Karnataka is 32.2 per 1000 live birth per year.^[3] As per UN report Crude death rate (CDR) between 2015-2020 is 8.1.^[4]

The profile of medico legal autopsy cases is important in order to know the death statistics in a region due to unnatural causes and also help to address the demographic needs according to the mortality statistics specific to that region. It is also necessary in order to prevent the preventable casualties in future and to study the genuine crime rate in the area.

This study aims to set up a profile of deaths owing to unnatural causes, so that we can direct rigorous efforts to curb their incidence. The finding of this study will create awareness among the people and it will also be helpful for law enforcement agencies to make the strategies for prevention of such incidences.

Material and Method

The present study is a retrospective study of medico legal autopsies conducted at KAHER'S Jawaharlal Nehru Medical College & KLE Hospital, Belagavi, Karnataka, India from January 2017 to December 2017. Detailed information regarding the circumstances of death was collected from inquest panchanama, hospital records

and post-mortem report. During the study period 159 medico legal autopsies were conducted in the mortuary of KLE Hospital. Data like age, sex, marital status, religion, calendar month, residence, causes of death & manner of death was compiled and analysed. Causes of death were grossly classified as trauma, thermal injuries, violent asphyxia, poisoning and other natural causes.

Results

A total of 159 medico legal autopsies were conducted during the period of 1 year from January 2017 to December 2017. During this period maximum number of cases were in the second quarter of the year i.e April to June (37.7%) and minimum number of cases were in the last quarter of the year i.e October to December (22%). Males outnumbered females (74.2%) with male to female ratio of 3:1. It was observed in the study that the maximum number of autopsy cases i.e. 55(34.6%) in both sexes were in the age group of 21-30 years followed by the age group of 31-40 years and 41-50 years [**Table 1**]

Table 1: Age and Sex wise distribution of cases

Age (years)	Male	Female	Total	Percentage
0-10	1	0	1	0.6
11-20	9	3	12	7.6
21-30	43	12	55	34.6
31-40	17	9	26	16.3
41-50	19	7	26	16.3
51-60	18	4	22	13.9
61-70	6	5	11	6.9
71-80	4	1	5	3.2
>80	1	0	1	0.6
Total	118	41	159	100

Hindus were majority in number with 147 cases (92.6%) followed by muslims with 12(7.4%), married were 122(76.7%) & unmarried were 37 cases (23.3%).

Table no-2 depicts that majority of the cases were from rural background i.e, 108 cases (67.9%) .

Table. 2: Distribution of Cases according to regions of living

Region	No.of Cases	Percentage
Urban	51	32.1
Rural	108	67.9
Total	159	100

Table no-3 depicts various manners of death. Accidental deaths were 110(69.2%), Suicidal 37(23.3%) and Homicidal deaths were 1(0.6%).

Table 3: Distribution of cause and manner of death cases.

Cause of death	Accidental	Suicidal	Homicidal	Natural	Total	Percentage
RTA	92	--	--	--	92	57.9
Poisoning	05	18	--	--	23	14.5
Burns	06	05	--	--	11	6.9
Electrocution	06	--	--	--	06	3.8
Fall from height	06	--	--	--	06	3.8
Snake bite	04	--	--	--	04	2.5
Hanging	--	02	--	--	02	1.3
Drowning	--	01	--	--	01	0.6
Lightening	01	--	--	--	01	0.6
Assault	--	--	01	--	01	0.6
Others	01	--	--	11	12	7.5
Total	110	37	01	11	159	100

From Table 4- Maximum number of RTA deaths were due to 2 wheeler vehicular accident (69.6%), followed by 4 wheeler vehicles (23.9%) & Pedestrian (4.3%)

Table 4: Distribution of cases according to Type of RTA cases

No. of Cases	Percentage	Type of RTA cases
04	4.3	Pedestrian
64	69.6	2 Wheeler
22	23.9	4 Wheeler
02	2.2	Heavy Vehicle
92	100	Total

In our study, RTA was most common cause of death (n=92, 57.9%), followed by poisoning including snake bite (n=27, 17%) & burns including electrocution and lightning (n= 18, 11.3%). Regarding age groups pattern among RTA cases majority of victims were in 21-30 years age group (n=27). The age group in which poisoning were common was between 21-30 years(n=11,

40.7%) followed by 41-50 years(n=4, 14.8%). Chemical poisoning was the most commonest (n=23, 85.2%) followed by snake bite(n=4, 14.8%). In thermal injuries 21-30 years (n=5, 27.8%)were common. There were 18 cases (11.3%) from thermal injuries of which commonest cause was burns (n= 11, 61.1%) followed by electrocution (n= 6, 33.3%) and only one case of lightning was autopsied. [Table 5]

Table 5: Distribution of cause of deaths according to Age

Cause of death	Age (Years) 0-10	11-20	21-30	31-40	41-50	51-60	61-70	71-80	>80
RTA	01	09	27	12	17	12	09	03	02
Poisoning	--	02	11	03	04	03	--	--	--
Burns	--	--	06	05	--	--	--	--	--
Electrocution	--	--	--	06	--	--	--	--	--
Fall from height	--	--	02	--	--	02	01	01	--
Snake bite	--	--	02	--	01	--	--	01	--
Hanging	--	--	--	01	--	01	--	--	--
Drowning	--	01	--	--	--	--	--	--	--
Lightening	--	--	--	01	--	--	--	--	--
Assault	--	--	--	01	--	--	--	--	--
Natural	--	--	05	02	03	02	--	--	--
Total	01	12	53	31	25	20	10	05	02

Deaths due to RTA was most common among males (n=73, 45.9%) compared to females(n=19, 11.9%) Thermal deaths were common in females(n=12, 66.7 %) as compared to males(n=6,33.3%). Most of the thermal deaths were suicidal (n=11, 61.1 %) followed by accidental(38.9%).Chemical poisoning was most commonly seen in males(n= 14, 60.9%) as compared to females(n=9,39.1%). Maximum number of deaths due to poisoning were suicidal(n=23, 85.2%) followed by accidental(n=4, 14.8%)

Discussion

During the study period a total of 159 cases of medico legal autopsies were performed at KAHER'S J.N Medical College and KLE hospital mortuary. Out of 159 cases maximum number of autopsy cases were in the age group of 21-30 years which is the most productive year in one's life. These findings are in consistency with findings of Kannan K^[5], Mathiharan K^[5], Curran WJ^[6] &

ME Bansude^[7].

In our study majority of victims were males(74.2%). Similar findings are seen in studies done by Murthy et al^[8] who studied 150 cases out of which 123(82%) were males & 27(18%) females. Mugadlimath et al ^[9]studied 64 cases out of which 39(61%)were males &25(39%) females.

The reason being that as males are bread earners and females usually doing household work, which makes the males more vulnerable to accidents, violence and stress & also males predisposed for risk taking behaviour.

In our study 92.6% were Hindus, and 7.4% were Muslims. Similar findings are observed in studies by Kannan K^[5], Mathiharan K^[5] and Curran WJ^[6]. Rural residents were 67.9% and only 32.1% were from Urban. This finding is contradicting to results of other studies done by Radhakrishna KV^[13] et al and Patel JB^[14] et al in which Urban residents were in majority. This difference

is due to our centre serves more rural population.

Deaths due to road traffic accidents & its complications constituted majority of cases 57.9% followed by poisoning 17% and burns 11.3%. Similar findings are observed in studies done by K Awdesh et al^[15] and ME Bansude.^[7] The reason being that our centre being tertiary care hospital, most of the accident cases are referred to our hospital including from rural areas.

According to month wise distribution of cases, findings of our study showed more number of cases between April to June. Similar findings are seen in studies by Patel et al^[14] and Awdesh et al^[15].

Conclusion

Study conducted at KAHER'S Jawaharlal Nehru Medical College & KLE Hospital Belagavi, to know the profile of medico legal autopsies during a period of one year from January 2017 to December 2017 comprising a total of 159 medicolegal autopsies. In our study we found that majority of cases were in 3rd decade of life, males outnumbered females, rural residents were more in number, Hindus being majority in number formed bulk of cases, RTA, Poisoning and burns were seen as leading cause of death, among road traffic accidents 2 wheeler accidents were more in number. Maximum number of cases were seen in the period between April-June. This study helps to interpret different types of medico legal autopsy cases, thereby providing an insight to the policy makers, law custodians, and the community to look into the specific aspects of the cases and then to take proper measures to reduce mortality.

Accuracy of Demirjian Age Estimation Method in South India Kadapa [A.P] Population-A Cross Sectional Study

Prem Kumar Moode¹, L Ananda Kumar², Ramesh Mittapelly³

¹BDS,MSc.(F.O) JSS Dental College and Hospital, JSSAHER Mysuru, ²Assistant Professor & I/C HOD Department of Forensic Medicine Govt Medical College(RIMS) KADAPA-516002. A.P, ³BDS, MSc(F.O) JSS Dental College and Hospital, Mysuru

Abstract

Background:Demirjian's technique of age assessment based on tooth development stages has been extensively investigated in different populations of the world. **Aim:** The present study is to assess the applicability of Demirjian's modified 8-teeth technique in age estimation of population of south India (Kadapa) **Materials and Method:** Two hundred pre-treatment orthodontic radiographs of patients in an age group of 10-20 years with representation from both genders were assessed for eight left mandibular teeth and scored as per the Demirjian's criteria. Statistical analysis was performed to compare the estimated and actual age. **Results:** The results revealed that the mean value in age estimation of the entire sample was 1.39years. The Mean value in males and females (10–20years) was 1.33and 1.46 respectively.**Conclusion:** significant positive correlation with estimating dental age in which chronological age is higher compared to dental age.

Keywords: Age estimation, Demirjian's method, forensic odontology, Indian-specific formulas.

Introduction

Age estimation has a particular medico legal significance. Estimation of age is one of the major components towards establishment of one's identity¹. Age estimation of the individuals play a vital role in many dental forensic as well as anthropology and archaeology disciplines. Age estimation is essential for the purpose of absolute identification in the living individual in civil cases like attainment of majority, voting rights, marriage, pension payments, inheritance, passport, driving license, insurance claims, disputed sex, missing persons, consent for operations, organ donation and criminal cases like persons accused of assault, forced prostitution, murder, rape, impersonation, kidnapping and juvenile offenders etc².

The method most frequently used in forensic dentistry was described by Demirjian et al^{3,4}. Their method described the use of tooth development stages

to calculate the dental age by using statistical equations. Further the classic Demirjian Method had divided the tooth development into 8 stages (A to H stages) of development, whereas the researchers have studied and added two more development stages between these 8 stages and have modified to give numbers to the ten developmental stages i.e. from 0 stage to 9 stages, to bring about more accuracy in the dental age estimation using Demirjian Method^{3,4}. Also these modifications in Demirjian Method studied in Indian samples have shown promising results^{5,6}.

The present study is to assess the applicability of Demirjian's modified 8-teeth technique in age estimation of population of south India (Kadapa). In this study shall be to correlate the developmental stages of all the 8 teeth Present on the lower left quadrant with chronological age evaluated on orthopantomograms [OPGs].

Materials and Method

OPGs of 200 patients of Andhra Pradesh [Kadapa] origin with known age proof between the age Group of 10-20 years were selected. The sample consisted of 100 boys and 100 girls and procured from the private diagnostics institution and clinics in Kadapa. It is a cross-

Email: drlak9@gmail.com.

sectional study. Approval from Ethical committee of JSS Academy of higher education and research, Mysore was obtained. Indian Formulas for Age^{7,8,9}. Estimation (developed on a sample of 165 males and 296 females aged 7 to 25 years):

1. For males, Age = $27.4351 - (0.0097 \times S2) + (0.000089 \times S3)$

2. For females, Age = $23.7288 - (0.0088 \times S2) + (0.000085 \times S3)$

All the data were analyzed using Microsoft Excel and statistical package SPSS version 20.0. Paired 't' test for mean chronological and dental ages of the selected sample was done. The date was sorted with respect to sex. Means are calculated for males and females separately. Linear correlation coefficient was calculated between each pair of chronologic age and the dental age

Inclusion Criteria

- 1) Subjects with both parents from Andhra Pradesh
- 2) Having no medical history and no obvious dental pathology on the panoramic radiograph related to mandibular left teeth
- 3) Patients between the age of 10 and 20 years at the time the OPG was taken.

Exclusion Criteria

- 1) Subjects without proper age proof.
- 2) Any teeth missing in the left mandibular arch
- 3) Image deformity affecting area of study.
- 4) Impacted/malformed teeth
- 5) Orthopantomogram showing obvious dental pathology.

Results

The radiographic evaluation of the tooth developmental stages was determined according to the 10 stage criteria given by Modified Demerjans Method. The results showed significant correlation between the chronological age and the estimated dental age.

Table 1: Age wise distribution of subjects used for the study

Age group	Boys	Girls	total
10-11	12	14	26
11-12	12	18	30
12-13	11	6	17
13-14	10	10	20
14-15	9	6	15
15-16	11	8	19
16-17	16	19	35
17-18	2	7	9
18-19	17	12	29
Total	100	100	200

Table 2: T-Test: Overall table

Mean Chronological And Dental Ages Of The Entire Sample					
		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	dental age	12.5802	200	2.04465	.14458
	chron_age	13.9794	200	2.69597	.19063

[Table 03] Results of paired 't' test for mean chronologiactal and dental ages of the entire sample						
Mean		Paired Differences		T	Df	Sig. (2-tailed)
		Std. Deviation				
Pair 1	dental_age - chron_age	-1.39925	1.91603	-10.328	199	.000

The mean dental age was 12.5802 years with the standard deviation of 2.04465, where as the mean chronological age was 13.9794 with the S.D value of 2.69597. When Independent samples 't' test was applied for the mean difference of 1.39925, t value of 10.328 was found to be significant at .000 level. From the mean values it is clear that chronological age was significantly higher than the dental age.

		Std. Deviation				
Pair 1	dental_age - chron_age	-1.33040	2.07253	-6.419	99	.000

The mean dental age was 12.7312 years with the standard deviation of 1.89189, where as the mean chronological age was 14.0616 with the S.D value of 2.70011. When Independent samples 't' test was applied for the mean difference of 1.33040, t value of 6.419 was found to be significant at .000 level. From the mean values it is clear that chronological age was significantly higher than the dental age.

Table 6 : T –Test [Females]

Mean chronologiactal and dental ages of the female sample					
		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	dental_age	12.4291	100	2.18588	.21859
	chron_age	13.8972	100	2.70290	.27029

Summary

The determination of dental age is of great importance in the field of dentistry, forensic medicine, anthropology etc. Many researchers have studied and analyzed dental age using the classic Demirjian method which had originally been formulated on French-Canadian population^{12,13}. Later on modifications were done in this method like addition of two extra teeth developmental stages making it to total 10 stages in place of 8 stages. Similarly due to effects of many external factors like different population groups, caste, culture, gender, environments etc, the area specific studies were conducted by many scholars. The present study has used the India specific Formula for the south Indian study group to know its reliability. The easy availability of panoramic radiographs in dental disciplines for various Clinical purposes can also help in age estimation through assessment of the different stages of tooth development are considered the best way to estimate the age in individuals^{14,15}.

This shall also indicate the skeletal maturity in the subjects under test, thereby reducing the radiation exposure towards obtaining multiple hand-wrist radiographs. More over the estimation of dental age using the Modified 10 Scale Demirjian's Method gives the reliable results¹⁶.

Thus, the present study indicates that this population specific age estimation method can have valid clinical as well as forensic applications for south Indian KADAPA population. The results of our study have concluded that the Demirjian method showed high accuracy when applied to Andhrapradesh Kadapa population. The results demonstrated that Demirjian method produced significant differences between dental age and chronological age in the study group. Significant positive correlation with estimated dental age in which chronological age is higher compared to dental age.

Ethics committee approval: Taken

Conflict of Interest: None declared

Iatrogenic Factors and Oral Health

Asma Usmani¹, Chavi Bhati¹, Mayur Kaushik², Afzal Ahmad³

¹BDS, Final Year PG, ² Prof. and Head Department of Periodontology, Subharti Dental College and Hospital, Meerut, ³BDS, MDS (Prosthodontics), Aligarh Muslim University, Aligarh

Abstract

The periodontium must be in a state of health for the effective functioning of normal dentition. Etiology of diseases related to periodontium may be iatrogenic i.e. those diseases that result from careless procedure done by a physician or a dentist. This article discusses iatrogenic factors affecting oral health.

Keywords: *Iatrogenic, Periodontics, Non-surgical Periodontal Therapy, Surgical Periodontal Therapy*

Introduction

“To err is human”

“**Iatrogenic**” is derived from Greek Language where “**Iatros**” means Doctor/Healer “**Gennan**” means “**as a Result**”.¹A tradition of conservatism in medical practice has understandably grown up in the centuries since Hippocrates told his disciples “Primum non nocere” i.e. do no harm. Man has always been aware of the hazards of the doctor-patient relationship, as well as the benefits. Napoleon, when advised to consult his physician said, “I do not want two diseases - one nature-made, one doctor made”.² Iatrogenic disease is defined as those diseases induced by physicians’ activity, manner, or therapy³and this term is usually used for an infection or other complications of treatment while iatrogenic factors in dentistry is defined as inadequate or inappropriate dental procedures that contribute to deterioration of teeth or periodontal tissues.It can be due to careless therapeutic procedures, injudicious use of instruments and chemicals, improper treatment planning and negligence which cause traumatic injuries to the periodontium.⁴

The etiology of periodontal disease can be iatrogenic in nature. If the procedure is not performed properly diagnostic procedures, restorations, endodontic therapy, fixed and removable prosthesis, orthodontic therapy and oral and maxillofacial surgical procedures have the potential to become iatrogenic.⁵

Iatrogenic factors related to periodontics:

1. Iatrogenic Problems due to Non-surgical Periodontal Therapy

- a) Reaction to any medication /local anesthesia.
- b) Post-operative bleeding.
- c) Post-operative pain.
- d) Post-operative swelling and bruising.
- e) Post-operative infection.
- f) Increased sensitivity to temperature
- g) Apparent changes in appearance of teeth due to gum recession as result of decreased inflammation.
- h) Tooth mobility/loss.

Pocket debridement in periodontal therapy by handinstrumentation (scaling and root planing, SRP) or ultrasonics is necessary for the treatment of periodontal disease. But it can cause many side effects. It can cause gingival recession resulting in exposure of root surface, inadvertently remove rootcementum and sometimes superficial parts of dentin also. Hence, a number of dentinal tubules will be exposed to the oral environment as treated root surfaces are normally left unprotected.⁶

Bergenholtz and Lindhe⁷ found that the incidence of pulpal lesions did not increase when teeth were subjected to scaling and root planing as compared to untreated teeth subjected to periodontal breakdown.

Patients who have received pocket/root debridement in periodontal therapy frequently experience sensitivity of the treated teeth to evaporative, tactile, thermal, and osmotic stimuli.⁸ Usually, the symptoms develop and peak during the first week, and then they

may subside or disappear within the subsequent weeks they are although uncomfortable.⁹

It has been observed that tissue trauma occurs during non-surgical periodontal therapy¹⁰ which triggers local mechanoreceptors and nociceptors that gets activated and release chemicals such as prostaglandins, bradykinin, and histamine leading to perception of pain in the central nervous system. Pihlstrom et al¹¹ reported that patients experienced pain of significant duration and magnitude after scaling and root planning.

2. Iatrogenic Problems Caused By Surgical Periodontal Therapy

An iatrogenic problem related to periodontics is formation of periodontal abscess which is of 3 types :

a) Post-therapy periodontal abscess: When small fragments of calculus is forced into the deep- periodontal tissues.¹²

b) Post-surgery periodontal abscess: When there is inadequate removal of subgingival calculus or there is presence of foreign bodies in periodontal tissues.¹³

c) Post-antibiotic periodontal abscess: When systemic antibiotics are prescribed without subgingival debridement in patients with advanced periodontitis which causes formation of abscess.¹⁴

Another iatrogenic problem is gingival recession which may result due to periodontal therapy. Since it occurs primarily as an outcome of resolution of the inflammation in the periodontal tissues, it is seen both following non-surgical and surgical therapy.¹⁵

Iatrogenic factors related to Endodontics:

1. **Sodium hypochlorite extrusion:** Sodium hypochlorite (NaOCl) is the most widely used irrigant, with a concentration ranging from 0.5–5.25%.¹⁶ It is bacteriocidal and has capacity to dissolve organic matter, dislodge debris from the root canal system and provide a degree of lubrication whilst shaping the canals during RCT.¹⁷ Although, there is a risk that NaOCl can get extruded into the periradicular and soft tissues leading to an intense inflammatory response and extensive damage of tissue.¹⁸ Sodium hypochlorite extrusion occurs when there is over preparation of apical foramen, pre-existing open apex, poor working length control and absence of dedicated endodontic irrigation needle and syringe.

Prevention:

a) Irritating syringes are not jammed into the apical part of canal.

b) Irrigation should always be performed relatively passively without excessive hydraulic pressure.

c) Side vented needles should be used.

2. **Instrument separation:** It is during non-surgical root canal therapy an instrument will separate in a canal system, blocking access to the canal terminus. This instrument is usually some type of file or reamer.

Causes:

- Improper use
- Too much apical pressure during instrumentation
- Inadequate access cavity preparation
- Excessive or unnecessary force is applied to instrument
- Overused instrument

Prevention:

- Flaws such as shiny areas or unwinding, are detected on the flutes.
- Excessive use had caused instrument bending or crimping.
- Excessive bending occurs during file usage.
- The file knicks instead of curving.
- Corrosion is noted on the instrument.¹⁹

3. **Aspiration of instruments:** Foreign body aspiration is a possible complication of dental treatment that may result in a life-threatening situation. The foreign body is often spontaneously ejected from the airway, but in other cases, surgical intervention is needed. Items that are more commonly accidentally inspired or swallowed include teeth, restorations and restorative materials, implant parts, rubber dam retains, impression materials etc. It is important for the clinician to employ all the correct techniques to reduce the risk.

Prevention:

- Using rubber dam

- Tie floss with stainless steel crown
- Floss is tied to endodontic file to prevent aspiration

Management:

Aspiration is managed by performing Heimlich manoeuvre which is a first aid procedure used to treat upper airway obstructions (or choking) by foreign objects and X-ray films should be taken to confirm the location of foreign objects in the respiratory tract.²⁰

4. **Iatrogenic pulp exposure:** Vital tooth is asymptomatic with sound dentin at the periphery. It may be due to small mechanical or traumatic exposure of pulp.

Prevention: By taking proper radiograph.

Management: In direct pulp capping, the protective dressing is placed directly over an exposed pulp;

For root canal treatment the inflamed or infected pulp is removed and the inside of the tooth is carefully cleaned and disinfected, then filled and sealed with a rubber-like material called **gutta-percha**.²¹

Iatrogenic factors related to Oral & Maxillofacial surgery:

1. **Inadvertent removal of Wrong Tooth^{22:}**

Causes:

- Use of different tooth numbering systems
- Differences in mounting of radiographs

Prevention:

- Focus attention on procedure.
- Check with the patient and the assistant to ensure that the correct tooth is being removed.
- Check, then recheck, images and records to confirm the correct tooth.

Management:

- The tooth should be replaced quickly into the tooth socket.
- Splinting is done.
- Endodontic treatment after successful

reattachment.

2. **Mandibular angle fractures during third molar removal^{23:}**

The magnitude of tooth impaction, deep vertical and horizontal impaction of third molars is considered to be a risk factor for iatrogenic mandibular fracture.

Causes:

- Type of tooth angulation, in cases of horizontal and distal 3rd molar angulation there are more chances of fracture.
- Length of roots,,
- Presence of a cyst or tumor around an impacted third molar,
- Systemic disease or medications that may impair bone strength,

Prevention: Can be prevented by taking proper history of the patient and taking radiograph.

3. **Luxation of an Adjacent Tooth during extraction^{24:}**

Causes:

- Due to Inappropriate use of extraction instruments.

Prevention:

- Judicious use of force with elevators and forceps
- Other teeth should not be used as fulcrum for an elevator.
- Narrow forceps may be useful for the extraction of tooth that is crowded and has overlapping adjacent teeth (eg. Mandibular anterior crowding)

Management:

- I. If an adjacent tooth is significantly luxated or partially avulsed
 - Reposition in the tooth socket and left alone
 - Occlusion should be checked
- II. Luxated tooth is mobile
 - The tooth should be stabilized with semi-rigid

fixation.

- For this a simple silk suture that crosses the occlusal table and is sutured to the adjacent gingiva is usually sufficient.

4. **Subcutaneous Emphysema²⁵**: It is caused by entry of air into fascial spaces of face and neck, resulting in distention of overlying skin or mucosa and is characterized by air being forced underneath tissue, leading to swelling, crepitus on palpation, and with potential to spread along the fascial planes.

Causes:

- Crown preparation when osseous surgery is done with arotar instead of a micromotar.

- Endodontic therapy when air is used for drying the canal instead of paper points.

- Extractions and other oral surgery.

Prevention:

- Handpieces that exhaust air into the surgical field are not used.

- Air-cooled instruments used in surgical orofacial procedures should vent air away from the immediate area or recirculate air to reduce risk of introducing it into tissues.

Management:

- Handpieces that exhaust air into the surgical field are not used.

5. **TMJ injury due to extended period of mouth opening during surgical procedure²⁶**:

Causes:

- Not using correct surgical technique.

- Failure to support mandible while removing mandibular third molars.

- Patient's protective mechanism for opening exceeded while under general anesthesia.

Prevention:

- Dentist should include examination of the temporomandibular region, evaluation of joint sounds, opening and excursive movements, and temporal/

masseter/ pterygoid muscle tenderness in all preoperative third molar extraction patients.

- A bite block should be used to stabilize the mandible upon surgical mobilization of the lower third molar teeth.

6. **Needle Breakage²⁷**:

Causes:

- Size of the needle
- Previously bent needle
- Defective needles

Prevention:

- Use larger gauge needle [25 gauge is adequate]
- It should be kept in mind that Hub is the weakest part

- Needle should not be redirected , once it is inserted into the tissue

Management:

- By evaluating the broken needle in a 3D CT scan.

7. **Needle Aspiration²⁸**

Causes:

- Improper fit of needle.
- Applying excessive pressure

Prevention:

- By using lower lock syringes instead of friction lock syringes

Iatrogenic problems related to Orthodontics

1. **Root Resorption²⁹**: Some degree of external root resorption is inevitably associated with fixed appliance treatment, although the extent is unpredictable. Resorption may occur on the apical and lateral surface of the roots. Vertical loss of bone through periodontal disease creates a far greater loss of attachment and support than its equivalent loss around the apex of a tooth.

2. **White Spot Lesions**: White spot lesion is one of

the most prevalent iatrogenic side effect of orthodontic treatment. White spot lesions are subsurface enamel porosities caused by enamel demineralization. According to Ogaard et al. white spot lesions develop as a result of prolonged plaque accumulation on the enamel surfaces adjacent to orthodontic devices, commonly due to poor oral hygiene.

Prevention:

- By improving patient oral hygiene using mechanical plaque control methods
- By enhancing the enamel resistance to the microbial acid by using topical fluoride
- By additional methods using different mechanisms.

3. Soft tissue injury:

- Minor aphthous ulcerations, or canker sores, can develop around the miniscrew shaft or on the adjacent buccal mucosa in contact with the miniscrew head.
- Soft-tissue coverage of the miniscrew head and auxiliary.

Iatrogenic problems related to Prosthodontics³⁰

1. Removable partial denture (RPD) is a denture for a partially edentulous patient who desires to have replacement of teeth for functional or aesthetic reasons but they favor plaque accumulation resulting in:

- Gingival inflammation
- Periodontal pocket formation
- Mobility of the abutment teeth.

2. **Denture Associated Mucosal Trauma** leads to keratotic, hyperplastic, inflammatory and ulcerative lesions.

3. **Traumatic Ulcers Due To Denture:** Because of reileff (resilient like effect), settling of mucosa after prosthesis may lead to pressure spots or ulcer. It can be prevented by removing sharp points in the denture.

Iatrogenic problems related to Paedodontics:

1. **Accidental swallowing of crown/bands³¹:** Accidental swallowing of Stainless steel crown/bands during a procedure

Prevention:

- Oral packing or tie floss to stainless steel crown

Bands could be secured by an adequate length of floss through the molar tubes and the free ends left outside the mouth, especially while banding the second molars.

2. **Removal of Premolar Bud:** Removal of premolar bud occurs during extraction of primary mutilated tooth in attempt to remove broken roots. It can be prevented by leaving small root portions as such, avoiding cryer's. If it comes out replace and suture it.

Iatrogenic problems related to Implant Surgery:

1. Sinus Perforation during implant placement³²:

Because of the close relationship between maxillary posterior teeth and the sinus cavity, a communication between the sinus and the mouth may result while implant placement. It occurs when indirect sinus lift perforation occurs.

Prevention: By Valsalva maneuver *which is performed by moderately forceful attempted exhalation against a closed airway, usually done by closing one's mouth, pinching one's nose shut while pressing out as if blowing up a balloon.*

Management: By simple closure of sinus.

2. **Sinus membrane perforation:** It may occur when direct sinus lift sinus membrane perforation occurs.

Causes:

- Anatomical variations such as a maxillary sinus septum, spine, or sharp edge are present
- Very thin or thick maxillary sinus walls

Management:

- A pericor membrane is placed to close the area.

3. **Inferior alveolar nerve injury during implant placement³³:** The mandibular nerve is a peripheral nerve which is the largest of the trigeminal branches and is the most common branch that is involved with neurosensory disturbances following dental implant surgery.

It can be prevented if

4. Implant size is proper
5. Accurate assessment of CBCT

Prevention:

- By proper planning before implant placement and proper skills.

Conclusion

Iatrogenic factors play a considerable role in dental diseases. When treating patients objectives of dentists must be clear, to avoid any undesirable outcomes of treatment. There is a need to increase awareness among dental practitioners about role of iatrogenic factors in order to get successful outcome of any dental therapy, which unfortunately is ignored for a long time.

Ethical Clearance- It is a review article.

Medical Malpractice in India: A Critical Analysis of Liability and Defense Framework

Hiranmaya Nanda¹, Amruta Das²

¹Assistant Professor, ²Assistant Professor, Faculty of Legal Studies, Siksha 'O' Anusandhan University, Bhubaneswar, Odisha, India

Abstract

Expectation of a reasonable degree of care is the foundation for alleging a breach of duty. In the wake of recognition of 'right to health' as a fundamental right declared universally. Moreover, the era of consumerism has dug deep into the medical profession making consumers aware of their lawful demands and rights making it a weapon in their hands for civil proceeding for tortuous or criminal prosecution for disregard and for lack in service in the consumer courts. The doctor-patient relationship stands on trust and faith. With the life expectancy being increased for technological and advancement in the medical science, no disease seems to be untreatable and challenged. However, concerns are their professional competence, compliance to therapeutic and laboratory standards of MCI on equipments and facilities, Wrong prescriptions, overdoses and non expertise, improperly equipped hospitals and on specific still continue raise agitations amongst the patients and relatives. Given all the justified reasons, often it becomes very difficult to sustain a claim for all the economic and non economic damages.

Keywords: medical malpractice, negligence, physician

Introduction

Ancient world civilizations have imprints of medical negligence being treated as a crime than a tort, However, with time, the judiciary treated it more of a civil wrong than a crime with a reluctance to implicate physicians with any reckless behavior or for deviation from the normal practice standards because of an underlying presumption that a sensible practitioner on good faith intends to extend best possible care and intends to cure. The evolution of common law on professional negligence dates back to the landmark case of Donoghue v. Stevenson . Medical negligence is a subset of professional negligence, requiring an additional perspective through the *Bolam's*¹ test which was accepted and reiterated in the landmark judgment of Jacob Mathew v. and as put by Bingham L.J. could mean

that, "professional man should command the corpus of knowledge which forms part of the professional equipment of the ordinary member of his profession. He should not lag behind other ordinary assiduous and intelligent members of his profession in knowledge of new advances, discoveries and developments in his field."²

Patient- Doctor Relationship

The doctor-patient relationship is a an relationship of a special trust and confidence with an underlying understanding of duty to act for the benefit of the fiduciary with a strong reliance on the skills and acumen of the doctor, he being in a string influential position .

The relationship of a patient and doctor being build on the highest level of trust and confidence, and health being the dearest assets to a person's wealth and his sustenance of family, any slip of advice, wrong and untimely diagnosis, compromised standard of care and precaution etc. often threatens the sanctity of the profession with allegation of commercialization and money making business. In a land mark case the court held that "the attitude of a patient is poised between trust

Corresponding Author:

Hiranmaya Nanda

Assistant Professor, Faculty of Legal Studies, Siksha 'O' Anusandhan University, Bhubaneswar-751003, Odisha, India, Email-Id: hiranmayananda@soa.ac.in , Mob: 9861057452

in the learning of another and the general distress of one who is in a state of uncertainty and such ambivalence naturally leads to a sense of inferiority and it is, therefore, the function of medical ethics to ensure that the superiority of the doctor is not abused in any manner. It is a great mistake to think that doctors and hospitals are easy targets for the dissatisfied patient.³

Apart from this fiduciary relationship, admittance of a patient under a doctor's treatment leads to a implied contractual obligations (except where it requires consent) utmost good faith, informed consent and assurance of appropriate standards of quality in due course of recovery.

Tortious Liability of medical Professionals

This is a specific tort of professional negligence where the act or omission falls short of the test of 'reasonable and prudent person. The widely acclaimed judgment of *Jacob Mathew v. State of Punjab & Another*⁴ has been instrumental in deciding the distinction between the jurisprudential concept of negligence in civil and criminal law. It observed that, "for negligence to amount to an offence, the element of mens rea must be shown to exist. For an act to amount to criminal negligence, the degree of negligence should be much higher i.e. gross or of a very high degree. Negligence which is neither gross nor of a higher degree may provide a ground for action in civil law but cannot form the basis for prosecution."

For negligence to be proved, the following elements are necessary

a. **Duty of Care**

b. **An act** : There must have been an omission or commission of an act by the doctor which was not supposed to be done

c. **Breach of duty**: "Such act or omission must have been occasioned either by not doing something which a reasonable man, under given set of circumstances, would do, or by doing some act which a reasonable prudent man would not do."

d. **Consequential damage**: Breach in duty has directly resulted in the injury of the person, either economic and non economic.

Any allegation of negligence against the doctor has to be materially substantiated with the best of evidence available in medical science and opinion of the experts.

Criminal Liability of Medical Professionals: Existing Legal Framework in India

The subjective state of mind with a guilty mind is the critical factor in implicating an accused doctor for criminal negligence. As observed in the case of *P.B. Desai v. State of Maharashtra and Another* (2013 15 SCC) it was rightly observed by the Apex court that, "the only state of mind which is deserving of punishment is that which demonstrates an intention to cause harm to others, or where there is a deliberate willingness to subject others to the risk of harm. Thus, negligent conduct does not entail an intention to cause harm, but only involves a deliberate act subjecting another to the risk of harm where the actor is aware -of the existence of the risk and, nonetheless, proceeds in the face of the risk."

Further in another case it has been held that, "to prosecute a medical professional for negligence under criminal law, it must be established that he/she did something or failed to do something which, given the facts and circumstances, no medical professional in his right senses would have done or failed to do. The risk taken by the doctor should have been of such a nature that the resulting injury was most likely imminent⁵."

Under the Indian Penal code, case of medical negligence are often filed under section 304-A making a rash and negligent act punishable with imprisonment for a term of two years, or with a fine or with both even though it was not intended either to cause death, or there was any like hood that he shall cause such. However, safeguard measure has been set in much known case of *Suresh Gupta (Dr) v. Govt. of NCT of Delhi*⁶, wherein, the standard of negligence required to be proved against a doctor under section 304A should be so high that it can be described as 'gross negligence' or 'recklessness', not merely lack of necessary care.

Some inherent immunity measures have been carefully crafted to protect practitioners for acts done in good faith. Section 88 of the IPC provides "exemption for acts not intended to cause death, done by consent in good faith for person's benefit. Section 92 states that treating without consent of patient is permissible if patient is unconscious, mentally ill or gravely sick. When the time required for disclosure would create a substantial risk of harm to the patient or third parties, full disclosure requirements may not apply. It is implied that the procedure and surgery is done to save the life or limb

of the patient. If possible, surrogate and proxy consent should be taken.”

The court also held that, “while, the medical professional is often called upon to adopt a procedure which involves higher element of risk, but which he honestly believes as providing greater chances of success for the patient rather than a procedure involving lesser risk but higher chances of failure. Just because a professional looking to the gravity of illness has taken higher element of risk to redeem the patient out of his/her suffering which did not yield the desired result may not amount to negligence⁷.”

Consumer Protection Act:

The advent of Consumer protection Act, 1986 brought a swiping change in the perspective of rights of consumers ranging from right to be informed on quality, standard of services, consumer awareness, redressal for any exploitation of consumers’ interests. Thus, questions have often been raised on patient’s status of being a ‘consumer of services’, medical practitioner’s status as rendering ‘service’ under section 2(1)(0) and circumstances when it can be deemed to a service.

The verdict in *Indian Medical Association v. VP Shantha*, (1995) 6 SCC 651 “settled all the concerns by covering the medical profession within the ambit of ‘service’ excluding those services of consultation, diagnosis and treatment (both medical and surgical) being rendered free of charge or under contract of personal service. However, service rendered at a non-Government hospital/nursing home where charges were required to be paid by persons who were in a position to pay and persons who could not afford to pay were rendered service free of charge would fall within ‘service’ as defined in section 2(1)(0). Thus settlement of legitimate claims arising under section 14(1)(d) and section 2(1)(g), the Consumer Disputes Redressal forums would apply the same principle as is applied before the civil courts. However the allegation of ‘deficiency of service’ would fail in a high risk case where accidental eventualities are not controllable.”

General Safeguards

It is a common knowledge that there is often a tendency to search for a human factor resulting in the unfortunate event and thus attribute the blame with some ‘act or omission’ which is normal reflection of distressed patient or the relatives. The Judiciary is in a process of

continuous efforts in retaining the sanctity of patient and doctor relationship and balancing the interests of the consumers and the service providers, certain safeguards and precautions/guidelines have to be maintained.

With successful implication of doctor for “professional misconduct” and setting Rs 6.08 crore compensation on Advanced Medicare Research Institute (AMRI) to pay for medical negligence, the famous case of *Kunal Shah v. Dr. Sukumar Mukherjee And Ors* clearly underlines some precautionary approach to be adopted by the Courts. It stated that “on receipt of complaints against a doctor or hospital, the consumer forum or criminal court, before issuing notice, should first refer the matter to a competent doctor or a committee of doctors, specializing in the field where negligence was attributed. Only after that doctor or committee “reports that there is a prima facie case of medical negligence should notice be issued to the doctor/hospital concerned. Stating that, no sympathy will be shown for doctors who are negligent, it reinforced a patient’s right to know the line of treatment being followed by doctors, including the risks involved in the treatment.”

The Constitutional bench in *Lalita Kumari v. Govt. of U.P* (2014) 2 SCC 1, provided a safeguard making an exception to mandatory registration of FIR, and held that there can be no registration of FIR against medical practitioners without preliminary inquiry.

Additionally, it requires individual medical practitioners and hospital administration to ensure;

a) Transparent Disclosures: “To secure the consent of the patient, an entailing (a) nature and procedure of the treatment; (b) any possible side effects of the medication; (c) availability of alternatives if any; (d) an outline of the substantial risks; and (d) adverse consequences of refusing treatment.”

b) Maintaining of Medical records

Conclusion and Suggestion

Every mishap, untoward incident or death during medical treatment need not necessarily points to the reckless conduct of the doctor and thus, criminal prosecutions without sufficient and satisfactory medical opinion pointing to their guilt could result in building mistrust amongst the patients and a great disservice to the community at large. In the field of medical profession service may vary from doctor to doctor however

adhering to the standard principles of service. Skills of the doctor also vary from person to person. Therefore it is said that, “negligence cannot be attributed to a doctor so long as he is performing his duties to the best of his ability and with due care and caution. Merely because the doctor chooses one course of action in preference to the other one available, he would not be liable if the course of action chosen by him was acceptable to the medical profession.”

Ethical Clearance: Not required, as the research article is based on medical malpractice and liabilities of professional negligence. The research is doctrinally undertaken.

Preclinical Diagnosis of Diabetes with Tongue Infrared Thermography and PSO Algorithm

A. Selvarani¹, G. R. Suresh²

¹Research Scholar, Department of Electronics and Communication Engineering, Sathyabama Institute of Science and Technology, Jeppiaar Nagar, Rajiv Gandhi Road, Chennai, India, ²Professor, St Peter's Institute of Higher Education and Research, Tonakela Camp Road, Sankar Nagar, Avadi, Chennai, Tamil Nadu

Abstract

The tongue use as an initial biomarker for disease diagnosis in Greek, western and Chinese culture. The tongue provides a non-invasive method to diagnose diseases in health care. The tongue shows gamut of symptoms due to disease and disorder. The traditional tongue diagnosis requires quantitative experience. In western medicine the tongue symptom use as one of the criteria for disease diagnosis. The tongue reflexology shows functioning of internal organs in body. Recent studies attribute chronic pancreatitis to saliva secretion. In this paper, we propose to diagnose diabetes with tongue thermal image. The Particle swarm optimization (PSO) algorithm to cluster thermally active pixels with similar intensity. The clustered tongue thermal region show drastic change for normal and diabetic person. The study involved 25 normal person and 25 type 1 diabetic person. The proposed approach diagnoses diabetes with 86% accuracy.

Keywords: Tongue, type 1 diabetes, Pancreas, salivary gland, insulin, Thermal image Particle swarm optimization.

Introduction

Diabetes, a heterogeneous disorder cause due to etiologic, pathophysiologic and genetic mechanisms. The insulin deficiency in body cause glycemic index of blood to increase. The insulin deficiency cause due to partial insulin production or no production by pancreas. Over 300 million people in the world affect by diabetes and the numbers are still increasing. The diabetes classify as type 1 diabetes, type 2 diabetes, gestational diabetes and monogenic diabetes. The type 1 diabetes cause due to insufficient insulin in body to regulate blood glycemic index. The insulin production in pancreas affect due to β - cell destruction. The β cells induce insulin production and secretion in pancreas. The β cell destruction causes due to autoimmune disorder. The type 1 diabetes further classify as type 1A and idiopathic or type 1B diabetes.

The tongue reflexology use in traditional Chinese medicine for disease diagnosis. The Greek and Chinese medicine relates tongue to internal body organs. The tongue reflects different organs such as epigastric, abdominal cavity, gall bladder, liver, spleen areas, pancreas and stomach. The tongue color and tongue coating reflects health of internal organs. The tongue

coating such as pale white, thick solid white color reflects operation of digestive system, metabolic and nutritive condition of tongue. The tongue coating use as biomarker to evaluate overall body health. The tongue free from stinging, swelling, burning and scarring reflect healthy tongue. The tongue diagnosis provides information about abnormal functioning of digestive tract and metabolism. Traditionally, doctors look at tongue to diagnose yeast infection, cancer, oral hygiene, candida growth, iron, B12 deficiency and herpes. In this paper, we propose computer aided diabetes diagnosis with tongue thermal image. The tongue thermal image process with Particle Swarm Optimization (PSO) to outline thermally active region.

Related Work:

A novel non-invasive method performed to diagnose Diabetes mellitus based on Sparse Representation Classifier (SRC) with facial block colour characteristics. The non-invasive capture device along with image correction is utilized to capture facial image. The facial image comprising of 4 facial blocks and the facial block placed around the face. From facial colour range, the Six centroids are used to estimate the facial colour

characteristics of each block. The facial blocks denote by facial colour characteristics. For Sparse Representation Classifier, Diabetes mellitus facial colour sub dictionary and Healthy facial colour sub dictionary are used in SRC process¹.

The novel invasive method is used to discover Non-proliferative Diabetic Retinopathy (NPDR) and Diabetes Mellitus. From tongue, image three different features extract namely texture, geometry and colour in Diabetic Retinopathy. Initially, the tongue images capture by using the non-invasive device along with image correction. Tongue colour range is separated with twelve colours, each colour represents tongue colour characteristics².

Human tongue colour has certain statistical distribution characteristics. The diagnostic feature extraction for tongue colour can be performed through analyzing these characteristics in-depth to describe the tongue colour space. There are three tongue colour space characteristics. The tongue colour range describes, colours centres with 12 colour types of tongue and tongue colour representing the colour distribution of particular image characteristics were analysed³.

The Munsell colour checker is used to enhance correction accuracy of tongue colours. The Munsell colour checker is designed with the help of tongue colour space. Tongue colour space is implemented by whole visible colours. Initially the tongue colour space is depends on the comprehensive tongue database. The visible colours categorize as tongue or non-tongue colours. From tongue colours, the tongue colour checker colours designed to attain maximum correction performance. Secondly, In colour checker, the minimum sufficient number of colors is created by comparing the correction accuracy when the range is different (ranges from ten to two hundred). Finally, for optimum colour selection technique, the objective function is presented. Two color selection techniques that is greedy & clustering based selection technique is used to solve objective function⁴.

The colour images are created by digital camera. The created information is dependent with the imaging characteristics of particular cameras. This is the major problem of tongue image analysis. Since, the tongue image analysis depends on the accurate performance of colour information. The optimized correction method is performed to adjust the captured tongue images in

several device dependent colour spaces into target independent colour space. By comparing different correction algorithm, the correction algorithm system is created with ridge regression, polynomial-based regression, neural network mapping, and support vector regression algorithms⁵.

Methodology

The tongue reflexology show changes in abnormality of organs in body. The tongue diagnosis is based on tongue color. The tongue color and tongue thermal activity boundary detect with pixel clustering. The tongue has different color such as dark-red, red, light red, purple and white. The thermally active region of tongue determine with infrared thermography camera. The tongue thermal activity change due to organ operation. The tongue thermally active region extracts to determine normal functioning of pancreas. The Infrared thermal camera acquires tongue thermal image. The low pass filter applies on thermal image to remove noise. The thermally active region in tongue cluster with particle swarm optimization (PSO). The PSO algorithm cluster pixel with similar intensity for thermally active region detection and extraction. The thermal region clustering aid in diabetes diagnosis.

Particle swarm optimization algorithm (PSO):

The PSO algorithm is based on social behavior of birds in a flock. The PSO algorithm processes alternative solution to particular optimization problem. The alternative solution to each problem is referred to as particle. For an 'n' number of variables, the alternative solutions represent by n dimensional point with search space. The fitness function applies to detect particle relation to optimal solution. The alternative solutions are flown through search space by adjusting the particle solution with respect to best position. The best solution select based on the swarm of particle. The alternative solution performance measure through solution relation to optimization problem.

The alternative solution has information such as current position of solution (x_i), current velocity of a particular solution (v_i) and best optimal solution (y_i).

The best position for a solution determine by solution visit to particular position in swarm. Hence, the particular position yields higher fitness value. The higher fitness value saves in memory. The objective function of fitness value denote by f and the alternate solution for

each position with respect to time denote by

$$\mathbf{y}_i(t+1) = \begin{cases} \mathbf{y}_i(t) & \text{if } f(\mathbf{x}_i(t+1)) \geq f(\mathbf{y}_i(t)) \\ \mathbf{x}_i(t+1) & \text{if } f(\mathbf{x}_i(t+1)) < f(\mathbf{y}_i(t)). \end{cases} \quad (1)$$

The information about alternative solution exchange between members in swarm. The information exchange provides best solution and its position in swarm. The information help particles to adjust to best solution. The particles deploy either in star or ring topologies. The star topologies aid particular particle to initiate communication with all other particles. The best optimal solution determines and all particles move to global best solution. The algorithm refers to as *gbest* PSO. The ring topology, determine particles that overlap with each other. The particles communicate with other particles to determine best particle solution. Once done, the solution adjusts to best neighborhood space. The above process is referred to as *lbest* PSO.

In *gbest* PSO the best solution determine by swarm of particles represented by

$$\hat{\mathbf{y}}(t) \in \{\mathbf{y}_0, \mathbf{y}_1, \dots, \mathbf{y}_s\} = \min\{f(\mathbf{y}_0(t)), f(\mathbf{y}_1(t)), \dots, f(\mathbf{y}_s(t))\} \quad (2)$$

Where

‘s’ represents particles in swarm.

In *lbest* PSO the neighborhood determine by

$$N_j = \{\mathbf{y}_{i-l}(t), \mathbf{y}_{i-l+1}(t), \dots, \mathbf{y}_{i-1}(t), \mathbf{y}_i(t), \mathbf{y}_{i+1}(t), \dots, \mathbf{y}_{i+l-1}(t), \mathbf{y}_{i+l}(t)\} \quad (3)$$

The best particle solution in N_j neighborhood represent by

$$\hat{\mathbf{y}}_j(t+1) \in N_j \mid f(\hat{\mathbf{y}}_j(t+1)) = \min\{f(\mathbf{y}_i)\}, \quad \forall \mathbf{y}_i \in N_j. \quad (4)$$

The neighborhoods determine by particle indices and topographical particles. In a swarm, the *gbest* PSO is simply equivalent to *lbest* PSO. The best optimum solution for *gbest* PSO determine by

$$\mathbf{v}_i(t+1) = w\mathbf{v}_i(t) + c_1\mathbf{r}_1(t)(\mathbf{y}_i(t) - \mathbf{x}_i(t)) + c_2\mathbf{r}_2(t)(\hat{\mathbf{y}}(t) - \mathbf{x}_i(t)) \quad (5)$$

$$\mathbf{x}_i(t+1) = \mathbf{x}_i(t) + \mathbf{v}_i(t+1) \quad (6)$$

Where,

w - inertia weight.

C_1, C_2 represents acceleration constants.

$r_1, (t), r_2 (t)$ represents vector sampled with uniform distribution.

In equation (5), the inertia term saves previous velocity in memory. The previous velocity in memory alters inertia weight. The high inertia weight induces exploration and low inertia weight causes exploitation.

The $\mathbf{Y}_i(t) - \mathbf{x}_i$ represents particles experience to determine best location for solution. The cognitive component saves previous best positions in memory.

The social component - $x_i(t)$ represents entire swarm prediction where the best solution is. The PSO influence by parameters such as ω , c_1 and c_2 . The theoretical studies show certain bound on values given by

$$w > \frac{1}{2}(c_1 + c_2), \quad w < 1 \quad (7)$$

In such cases, the PSO shows convergent behavior. The particle adjustment limit by allocating predefined search space and limiting particle velocity.

The PSO algorithm updates the search space until the iterations are met or the velocity is close to zero. The fitness function applies to measure particle quality. However, all the particles converge to an optimum point, which cause particle stagnation. The particle stagnation overcomes by local convergence. In local convergence, the global best particle index update with velocity given by

$$v_{\tau,j}(t+1) = -x_{\tau,j}(t) + \hat{y}_j(t) + wv_{\tau,j}(t) + \rho(t)(1 - 2r_{2,j}(t)) \quad (8)$$

Hence, the position update is represented by

$$x_{\tau,j}(t+1) = \hat{y}_j(t) + wv_{\tau,j}(t) + \rho(t)(1 - 2r_{2,j}(t)). \quad (9)$$

Where, $-x_T$ represents reset of particle position for global best position v_T represents direction for search and addition of random search term $r_2(t)$.

Where, ρ determines search space for optimal solution. The ρ initialize to 0 with ρ defined by

$$\rho(t+1) = \begin{cases} 2\rho(t) & \text{if } \# \text{ successes} > s_c \\ 0.5\rho(t) & \text{if } \# \text{ failures} > f_c \\ \rho(t) & \text{otherwise.} \end{cases} \quad (10)$$

The failure state occur when $f(\hat{y}(t)) \geq f(\hat{y}(t-1))$ and variable are incremented. The success state occurs when $f(\hat{y}(t)) < f(\hat{y}(t-1))$. The values of f_c and S_c vary dynamically represented by

$$s_c(t+1) = \begin{cases} s_c(t) + 1 & \text{if } \# \text{ failures}(t+1) > f_c \\ s_c(t) & \text{otherwise.} \end{cases} \quad (11)$$

$$f_c(t+1) = \begin{cases} f_c(t) + 1 & \text{if } \# \text{ successes}(t+1) > s_c \\ f_c(t) & \text{otherwise.} \end{cases} \quad (12)$$

The success state becomes hard to achieve when multiple failures occur. The failures cause due to over confident convergent behavior, which make the search space to be smaller surrounding global best position. The success rate and failure rate represent by equation

$$\begin{aligned} \# \text{ successes}(t+1) > \# \text{ successes}(t) &\Rightarrow \# \text{ failures}(t+1) = 0 \\ \# \text{ failures}(t+1) > \# \text{ failures}(t) &\Rightarrow \# \text{ successes}(t+1) = 0. \end{aligned} \quad (13)$$

The algorithm reaches a stop position when ρ becomes a small value or when stopping criteria is met.

Result and Discussion

The thermal flow on the tongue surface is measured using the thermal camera. Fluke infrared thermal camera is utilised to capture the thermal images of tongue from normal and diabetic patients. The recorded thermal image is applied to PSO segmentation and texture analysis to identify the variation in the flow of heat over the surface of the tongue. Before applying to the algorithm the thermal image should be pre-processed with image filters and Haar wavelet transformation. Pre-processing the thermal image results in elimination of noises added during the image-processing unit within the thermal camera. The noise from surrounding environment affects the pixel values of the recorded Thermal Image. To overcome this additional noise the thermal image is initially pre-processed with the Gaussian High pass and Low Pass filters. Gaussian Low pass filter is used to smoothen the input image. This results in blurred output of the input image. Gaussian smoothing is used to remove the high frequency noises and enhance the structures in diabetic tongue and normal tongue image. The excessive edges generated by the noises were smoothen and the enhanced image is generated.

The high pass filter sharpens the input image by highlighting the fine details in the input image. Gaussian high pass filter is applied over the diabetic tongue and normal tongue thermal images.

The filtered thermal image process with HAAR Wavelet transformation. The HAAR wavelet transformation extracts the features from the input image. Identifying the edges in the input image is more important in segmentation process. The filters applied over the input image removes the noise but the resultant image was blurred. To enhance the edges from the filter output the HAAR wavelet transformation is applied which process over the time frequency medium, which enhance the time frequency resolution of provided image.

The HAAR wavelet transformation enhances colour regions of thermal flow, which assists the colour analysis to identify sharp edges in resultant image of wavelet transform. The colour analysis is used to enhance the thermal flow by increasing the contrast of colour pattern of input image. Red colour represents the higher heat flow, Yellow moderate heat flow and green represents

low heat flow. Thus, the exact region of heat flow can be measured from the results of colour analysis. Figure 1 and 2 represents the original and colour analysis image of diabetic tongue and normal tongue image. The heat flow is higher at the centre segments of the diabetic tongue, which is not present in normal tongue thermal image. The normal tongue thermal image shows the uniform heat flow but diabetic tongue image shows increase in heat flow in middle regions of the tongue.

Figure 1: Colour analysis for Diabetic Tongue Image.

Figure 2: Colour analysis on Normal Tongue image.

The output of the colour analysis is applied to the Particle swarm optimisation technique to perform image segmentation to identify the exact location of heat change in diabetes and normal tongue thermal image. PSO algorithm groups the data set into regions. The image segmented using PSO algorithm is well grouped into regions of homogeneous colours and provides the knowledge about the presence of number of regions in the input image. Figure 3 shows the PSO output for Diabetic tongue thermal image and normal tongue thermal image. The group of heat zones and spreading out of temperature was segmented clearly. It shows the thermal hotspots on the surface of diabetes tongue. The figure 3 shows the grouping of heat zones in the normal tongue thermal image. The comparative analysis shows absence of heat zones in normal tongue. The heat flow is evenly dissipated throughout the tongue surface.

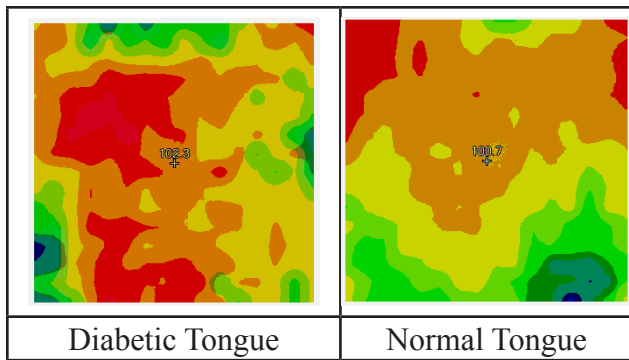

Figure 3: PSO segmentation for Normal and diabetic tongue images.

Local Binary pattern (LBP) is an efficient tool to perform texture analysis over the input images. LBP

converts the pixel values of the image into binary codes based on the threshold value of the centre pixel. Eight neighbour points of every centre frequency was grouped together. The pixel value greater than or equal to centre value is assigned as 1 and the value smaller than centre pixel value is assigned as 0. The input image was grouped into local structure with a centre pixel value. Histogram analysis is performed over each structure of LBP. The combined histogram output of each structure of normal tongue thermal image and diabetic tongue thermal image, are spitted sparse and tight histogram plots are shown in figure 4 and 5. The output of Efficient LBP image and Pixel wise LBP image shows the change in tongue thermal image pixel intensity.

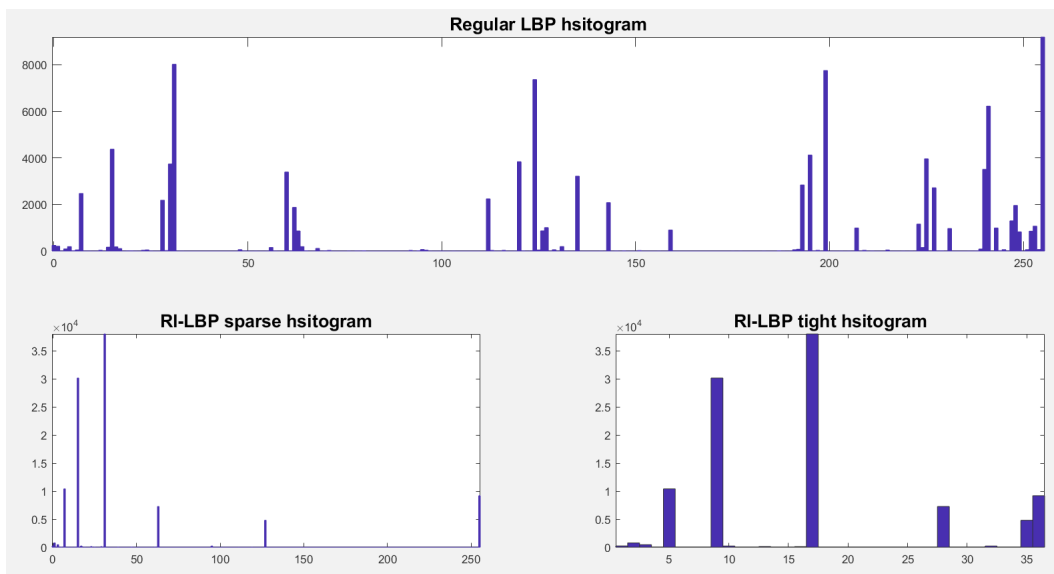

Figure 4: Histogram for Local Binary Pattern for Diabetic Tongue Image

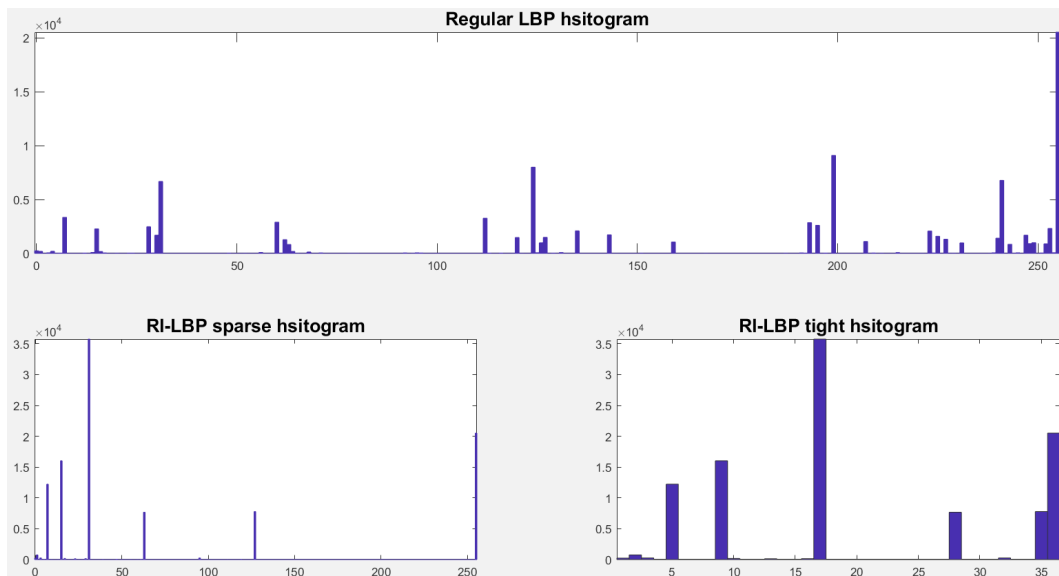

Figure 5: Histogram for Local Binary Pattern for Normal Tongue Image

Conclusion

In this paper, we propose to a non-invasive approach to diagnose diabetes at an earlier stage through tongue thermal image. The tongue thermal colour differences acquire via fluke thermal camera for normal and diabetic person. The PSO algorithm apply to cluster thermally active pixel in image. The texture extract from clustered thermal image for diabetes diagnosis. The texture show change in tongue texture, geometry and colour. The effectiveness of proposed method validate by processing thermal tongue images of 25 normal person and 25 type1 diabetic person. The tongue thermal features show positive correlation for diabetic person.

Abstract

The *Jammu & Kashmir (J&K) Consumer Protection Act, 1987* needs a closer scrutiny from the standpoint of medico-legal services in the wake of J&K Union Territories' (UTs) uneven health profiling and developmental progress. The doctor-patient's relationship needs an analysis in terms of access to health care and medical and para medical services. The consumer rights under *Consumer Protection Act, 1986, Jammu and Kashmir Consumer Protection Act, 1987* and *Consumer Protection Act, 2019* represents a trajectory of deficiency of medical service and lack of medical professionalism and capacity building among health personnel. The paper is a medico-legal profiling of Sher-i-Kashmir Institute of Medical Sciences (SKIMS), Srinagar in regard to diligence and negligence of doctors and para legal medical inspectorate in auguring health care and medical services to patients.

Key words: *Medico-Legal Services, Uneven Health Profiling, Health Care Services, Diligence & Negligence of Doctors, Para Medical Inspectorate.*

Introduction

The health services in UTs of J&K since three decades discern uneven health profiling and developmental progress. The state is reeling under infectious diseases and chronic health disorders. The inadequacy of preventive and curative system is adversely affecting health equity as well quality.¹ The healthcare system, emergency preparedness and trauma prevention in geographic oddities of UTs of J&K are proving detrimental to health and welfare of people. This is further aggravated by inverse doctor-patient ratio of 1:1880 as against the World Health Organisation ratio of 1:1000.² The woefully understaffed 14,686 paramedics against the requirement of 18,436 paramedics makes the access to health care precarious to sickness. Despite

sizable number medical institutions and mammoth funding there is a shortage of critical care ambulances at district, sub-district and medical colleges in the state to provide life support system to seriously injured patients. The healthcare infrastructure seems to be ineffective in innovative quality care, accessibility and affordability and regulatory measures standards and norms.³ There was a sudden decline in annual birth rate which fell to nearly 20 per million from the level of 34 per million. The annual death rate also registered a sharp decline from 7.90 in 1990 to 5.40 in 1998 in the state. A comparison of infant mortality with the rest of the country shows that the IMR in Jammu and Kashmir is 45.4, far below the national average of 71.6 per thousand. The state of J&K has once again registered a significant decline in the infant mortality rate (IMR) from 26 per 1000 live births to 24 per live births as per latest sample registration system (SRS) bulletin by Registrar General of India.⁴

Materials & Method

The study employs material and methods of legal research by critical scrutiny of consumer laws at central and state levels in legal pragmatism discourse.⁵

The *Consumer Protection Act, 1986*, *J&K Consumer Protection Act, 1987* and *Consumer Protection Act, 2019* are studied *pari materia* under canons of statutory interpretation in Scalia and Garner construct in the context of health care services.⁶ The material and method partakes an empirical frame work of SKIMS, Srinagar a premier medical institution in J&K state on medical services, doctors diligence and negligence, Emergency and trauma, capacity building assessment of para medical personnel in actualisation of consumer justice.

Findings

The need of for transparent management of consumer justice and compensation inclusive of health services and disease overburden needs proper regulation. The health status has not been able to keep pace with the national level of achievements because of the political turmoil and poor infrastructure. The J&K Consumer Protection Act, 1987 has substantially vindicated patient's rights to health access and compensatory justice.⁷

Constitutional & Legal Dimensions: The *Consumer Protection Act, 1986* was not applicable to J&K because of its special status under Article 370 of the Constitution of India, 1950. Under this constitutional scheme, the state of J&K has to decide either to extend the central law to state or to enact similar law for state of J&K.⁸ Accordingly the State enacted *J&K Consumer Protection Act, 1987* to give effect to *Consumer Protection Act, 1986* with a few variations to take care of health care services. The government took a constitutional leap by abrogating Article 370 and bifurcated the State into two Union Territories (UTs) under *Jammu and Kashmir Reorganisation Act, 2019* on 9th August, 2019. Coincidentally the Consumer Protection Act, 2019 was also passed on same date *i.e.*, 9th August, 2019 but clearly mentions that 'it extends to the whole of India except the State of Jammu and Kashmir.' Therefore the *J&K Consumer Protection Act, 1987* is still a valid law although it will undergo a revamping in the light of *Consumer Protection Act, 2019* by the J&K legislature under *J&K Reorganisation Act, 2019*.

J&K Consumer Protection Act, 1987: The *J&K Consumer Protection Act, 1987* provides speedy redressal to consumer complainants inclusive of health care services by setting up of a District Consumer Redressal Forum and State Commission having jurisdiction to claim of Rs. 10 lakhs and Rs. 30 lakhs respectively. Section 2 (1) (d) *J&K Consumer*

Protection Act, 1987 defines 'consumer' to mean any person who buys any goods or hires any service for a consideration which has been paid or promised or partly paid and partly promised, or under any system.⁹ Section (2)(1)(g) defines 'deficiency' to mean any fault, imperfection, shortcoming or inadequacy in the quality, nature and manner of performance which is required to be maintained by or under in any law for the time being in force or has been undertaken to be performed by a person in pursuance of a contract or otherwise in relation to any service. section 2(1) (0) defines 'service' to means service of any description which is made available to potential users and includes the provision of facilities in connection with banking, financing, insurance, transport, processing, supply of electrical or other energy, board or lodging or both, entertainment, amusement or the purveying news or other information, under a contract of personal service. Thus it applies to all goods and services except those which are specially exempted by notification by the state government; however the state government has not specifically exempted health care services provided by government hospitals.¹⁰

Comparison of Central & State Consumer Laws: This Consumer Protection Act applies to the whole of India except the State of Jammu and Kashmir having their own legislation J&k consumer protection act 1987 with some variations and covers all goods and services purchased by the consumers and to all sectors private, public and cooperative. The objective of the Act is "to provide for better protection of the interests of consumers and for that purpose to make provisions for the establishment of Consumer Councils and other authorities for the settlement of consumer disputes and for matters connected therewith". It protects the consumers from unfair trading or unfair trade practices. It is important to note that the both Consumer Protection Acts are social welfare legislation and has been designed to avoid technicalities, procedural delays, procedural requirement, court fees and costs. Under the Consumer Protection Act 1986 three-tier consumer disputes redressal system at the District, State and National levels has been set up and in state of J&K two tier redressal agencies one Divisional forum and state commission. The Consumer Commissions are authorized to impose penalties on trader or person against whom complaint is made if he fails to comply with the order of the redressal agency. The penalty or punishment may involve imprisonment for a period not more than 3 years or a fine or both.¹¹ The 'service

of any description made available to potential users’

under *Consumer Protection Act, 2019* can be statutorily interpreted and liberally construed as a beneficial piece of legislation for auguring consumer justice but does not absolve doctor from the purview *Consumer Protection Act, 2019*.¹² Moreover the judicial enunciations in *Indian Medical Association v. V.P. Shantha* Case by Supreme Court in 1996 being good piece of law is not even barred by the *Consumer Protection Act, 2019*.¹³

Discussions

The perusal of The *Consumer Protection Act, 1986*, *J&K Consumer Protection Act, 1987* and *Consumer Protection Act, 2019* applied to the case study of SKIMS manifests that the doctor owes duty of care in treatment and any breach gives a cause of action by patient for medical negligence and award of compensation. The medical negligence and deficiency of service is based on the cardinal test for liability in tort and *ipso facto* applied by Section 2 (I) (o) *J&K Consumer Protection Act, 1987* in SKIMS. The institution is semi-

autonomous super-specialty hospital and the deemed university having gastroenterology, cardiology, urology nuclear medicine and general medicine etc. These departments are delivering functions on across modern and scientific lines also the hospital administration is supervising the administrative affairs of hospital.¹⁴ It has College of Nursing and College of Paramedical Sciences. It awards degrees in all subjects of Medicine and allied specialties such as DM, M Ch, MD, MS, Ph D, MBBS, M Sc Technology, M Sc. Nursing, B Sc Nursing & Technology, etc. It is one of the top ranking medical institutes in India and provides prevention, treatment, rehabilitation, obstetrics, substance abuse, health education, and screening for cancers and other diseases.¹⁵

Medical & Health Care Services: The central inquiry pertains to medical and health care services by applying randomized sample survey of 100 patients in and out patients department of SKIMS. The Table-1 depicts the responses of patients having varying degree of satisfaction towards medical and health services.

Table -1: Medical & Health Care Services

Patients	Respondents	Yes	%age	No	%age	Indifferent	%age
In Patients	50	33	66	15	30	02	04
Out Patients	50	15	30	24	48	11	22
Total 100	100	48	48	39	39	13	13

Source: Field Work

The above table discerns that 48% respondents faced trouble while getting admitted in the hospital while as 39% respondents said they have not faced any problem admitted in hospital. However the remaining 13% respondent is oblivious of any opinion on the subject.

Doctors Diligence & Health Care: The aim and the objectives of medical services are to provide treatment to those who are in need of urgent medical care and patient needs immediate health care in hospitals.

Table-II: Doctors Diligence & Health Care

Patients	Respondents	Yes	%age	No	%age	Indifferent	%age
In Patients	50	33	66	12	24	05	10
Out Patients	50	26	52	21	42	03	06
Total 100	100	59	59	33	33	08	08

Source: Field Work

The patients interviewed while undergoing the treatment in SKIMS reveals that 59% respondent are pretty satisfied with doctors’ diligence while 33% shows that doctors don’t show their due care and circumspection in examining and treating the patients. However 8% respondents are either ignorant or indifferent about doctors’ diligence and negligence.

Medical Negligence & Liability: Put it differently, as to whether the doctors are having negligent behaviour towards medical care and therapeutic treatment in SKIMS, the 33% respondents said that they are quite satisfied with their due diligence.

Table-III: Medical Negligence & Liability

Patients	Respondents	Yes	%age	No	%age	Indifferent	%age
In Patients	50	13	26	29	58	08	16
Out Patients	50	20	40	18	36	12	24
Total 100	100	33	33	47	47	20	20

Source: Field Work

Whereas a majority of 47% respondents express dissatisfaction about hospital housekeeping staff with specialised knowledge are indifferent towards specific to health care site and cleaning protocols at work. However, one fifth of respondents ignore to have any opinion about the housekeeping facilities in hospitals.

Health Care Services & Emergency Preparedness: The health care services can be gauged from the emergency preparedness’ of SKIMS which involves acute injury or illness, immediate risk to a person’s life and long-term health effects.

Table -IV: Health Care Services & Medical

Emergency

Patients	Respondents	Yes	%age	No	%age	Indifferent	%age
In Patients	50	25	50	23	46	02	04
Out Patients	50	15	30	29	58	06	12
Total 100	100	40	40	52	52	08	08

Source: Field Work

The health care services can be gauged from the emergency preparedness’ of SKIMS which involves acute injury or illness, immediate risk to a person’s life and long-term health effects. The medical care in an

emergency data revealed that 40% respondents agreed to adequacy of safeguard mechanism. On the other hand, 52% respondents are deprived of medical care in emergency while and 8% respondents feign ignorant

about it.

Para Medical Personnel & Health Care Delivery: The overall perception about medical and para medical personnel in health care delivery, protocol and therapeutics seems at a low level. There is no denying of fact that the hospital administration have duty to provide care but while interacting with patients they are not found sobering towards medical ethics.

Table -V: Para Medical Personnel & Health Care Delivery

Patients	Respondents	Yes	%age	No	%age	Indifferent	%age
In Patients	50	13	26	29	58	08	16
Out Patients	50	20	40	18	36	12	24
Total 100	100	33	33	47	47	20	20

Source: *Field Work*

The behaviour of hospital staff, according to survey reveals that 33% of respondents saying it up to mark. The 47% respondent chooses to disagree and 20% remain indifferent to behaviour of hospital staff and nurses. It is under this backdrop, the Comptroller and Auditor General (CAG) of India has reported that there are over 4,000 deaths at SKIMS in 2007-2012. In a published report that says that Kashmir's dream hospital has seen 12,860 deaths. It is based on CAG Report which has noticed that out of 12,860 hospitalized patients died as many as 7,875 after 48 hours of their admission during 2007-2012.¹⁶ The pragmatic analysis of *J&K Consumer Protection Act, 1987* reveals that there has been substantial consumer right awareness¹⁷ and realization of right to health and medical services during last three decades of its enactment.¹⁸

Conclusion

The medico-legal profiling of SKIMS under *J&K Consumer Protection Act, 1987* in regard to health status of the people in the union territories of Jammu and Kashmir has been deeply interwoven with medical care, doctors' diligence, negligence and liability, emergency preparedness, protocol and therapeutic delivery by medical and para medical staff. On the broader plain, the medico-legal profiling has direct nexus with poverty, poor infrastructure and incidence of chronic and infectious and political instability driven life style diseases. Thus the trajectory of *Consumer*

Protection Act, 1986, J&K Consumer Protection Act, 1987 and Consumer Protection Act, 2019 orient to a novel discourse in medical & health care services, doctors diligence and negligence, health care services and emergency preparedness, para medical personnel in health care delivery. The *Consumer Protection Act, 1987* is nicely drafted enactment and meticulously tilted towards consumer oriented aspirations but eludes in therapeutic perception as well as consumer justice. The judicial annihilation of compensatory jurisprudence in medico-legal cases are far clear in clamping civil and criminal liability but seems in nascent stage of formation in union territories of Jammu and Kashmir. The empirical evidence of SKIMS under the preponderance of balances is not very encouraging to healing effects of patients under the *J&K Consumer Protection Act, 1987*.

The Prospect of Environmental Law to Achieve Healthy Environmental Development in Indonesia

Absori Absori¹, Sigit Sapto Nugroho², Anik Tri Haryani², Sarjiyati Sarjiyati², Arief Budiono³, Heru Santoso Wahito Nugroho⁴, Rangga Jayanuarto⁵

¹Muhammadiyah University of Surakarta, Indonesia, ²Merdeka University of Madiun, Indonesia, ³Muhammadiyah University of Ponorogo, Indonesia, ⁴Health Polytechnic of Surabaya, Indonesia, ⁵Muhammadiyah University of Bengkulu, Indonesia

Abstract

Every citizen has the right to achieve the constitutional guarantee to live in a good and healthy environment, to be able to grow and develop. The environmental law's role and prospect as the agent of stability, agent of development, and agent of change is something which cannot be negotiated to achieve a healthy environmental development in Indonesia. It is to avoid pollution and environmental devastation for the sake of today's and the future's generations.

Keywords: *Environmental law, Healthy environment in Indonesia.*

Introduction

One of the problems which occur in this modern-day era is ecological problems. These past few decades, the nature has become a real threat for the life of human beings.¹ Even though human beings are actually posing the most serious threat towards the environment compared to other organisms.² The action of human beings which places the nature as a commodity which is exploited without taking the environment's carrying capacity into consideration. Such actions will make the environment experience degradation.³

There needs to be a combination of teamwork and harmony to prevent and to deter the environmental degradation and pollution. The aspects of environmental management legal regulations and natural resource's conservation in Indonesia must be reviewed intensively. That is the main role of environmental law.⁴ The regulatory aspects of environmental management and natural resources conservation in Indonesia need to be studied intensively, this is where the main role of environmental law.⁵

The environmental law has developed rapidly, the legal function acts as protection, control and certainty of the community with the role of agent of stability, also acts as an agent of development or agent of change.⁶ Environmental problems are getting bigger, wider and more serious. Like a snowball, the longer it rolls the bigger it comes. The problem is not only local or trans local, but regional, national, transnational, and global. The impacts towards the environment are not only related to one or two aspects, but it interrelates in accordance with the nature of the environment which has multi chains of relation that influence each other sub-systematically. If one aspect of the environment is affected, then the other aspects will also have an impact or effect.⁷

The environmental problems basically are everyone's problem and it is a must that awareness movements to restore environmental conditions to a better direction are built, by taking whatever role can be done by all parties to repair the surrounding environmental damage. The 1945 Constitution of the Republic of Indonesia, Article 1 stated explicitly that the sovereignty is on the hands of the people. Hence, it is the people's authority to make the efforts to save the environment in Indonesia. In the 1945 Constitution Article 28H paragraph (1), it determines "everyone has the right to live in physical and spiritual prosperity, to

Pabelan Surakarta, Indonesia.

life, and to have a good and healthy living environment and the right to obtain health services”, then explained in the Constitution Number 32 of 2009 regarding The Environment Protection and Management (UUPPLH).

Based on this background, the problem that can be formulated is: how is the environmental law’s prospect in realizing a healthy environmental development in Indonesia?

Research Method

The research method used in this study is the method of normative legal research, which put law as a structure of norm system⁸ with conceptual and constitutional approach.⁹

Findings and Discussion

Various environmental repairs and recoveries are not in par with the rate of damage and pollution that occur. It indicates that environmental issue is not yet at the center of the Indonesia’s development. Under the pretext of development and free trade, government and companies or national and transnational corporations continuously exploit the environment and the natural resources.¹⁰ According to J. Barros and J.M. Johnston, the disasters occurred are closely related to the development activities by human.¹¹ This will affect the survival of today’s and the future’s generation.¹²

Based on its development, the conception of healthy environment as a part of the human rights was apparent when the United Nations Conference on the Human Environment was held in Stockholm, Sweden, on June 5th-6th 1972, which sparked the Stockholm Declaration. This conference is the first step of the awareness from the international community on the importance of the environmental sustainability as basic part of the Human Rights fulfillment. In Principle 21 and Principle 11 of Declaration on the Human Environment from Stockholm Conference, it stated that the States have sovereign rights to exploit their natural resources in accordance with their environmental protection and preservation policies. In its exploitation, the States have the responsibility on every activity that damages the environment or the areas of the other states beyond their national jurisdiction.

The rights to life and to obtain a good and healthy environment mean that every citizen has the right to achieve the constitutional guarantee to live in a good and healthy environment, so as to grow and develop.

This provision can be juxtaposed with the Article 25 of Universal Declaration of Human Rights (DUHAM) which stated, “everyone has the right to a standard of living adequate for the health and well-being of himself and of his family”. Then the Article 12 paragraph (1) of ICESCR emphasized, “The States Parties to the present Covenant recognize the right of everyone to the enjoyment of the highest attainable standard of physical and mental health”. It means the life needs of Indonesian citizens must also be met with the adequate standard of their health or other matters related to supporting one’s life. More broadly, the meaning of this norm is strengthened by stipulating one of the State’s goals as the purpose of the State (*staadsidee*) in the Fourth Paragraph of the 1945 Constitution’s Preamble, it is to protect the whole people of Indonesia and the entire homeland of Indonesia.¹³

It is very relevant if the author states that the right to the environment as part of the Human Rights is by nature a gift from God to the mankind. Therefore, it is also very relevant if the Human Rights theories or teachings are related to various violations on the environment, which have occurred in almost all levels of the society. The violation on the right to the environment should be defined as a threat towards human civilization. Eventually, it accumulates and leads to the violations of economical right, social and cultural right, civil and political right, or in other words a violation of human rights.¹⁴

The regulation on the right to the environment is also contained in the Fourth Paragraph of the 1945 Constitution’s Preamble, which stated “...to form a Government of the State of Indonesia that shall protect the whole people of Indonesia...” And based on Article 28H (1) which states that, “Each person has the right to obtain a prosperous life, a proper place to live with good environment and health services.” Article 33 paragraph (4), “The national economy is implemented based on economical democracy by the principles of togetherness, justice, sustainable with environmental-concept efficiency, independency, also by stabilizing the progress and unity of the State’s national economy.

The human rights charter which is an inseparable part of People’s Consultative Assembly’s Decree No. XVII/MPR/1998 which was stipulated by People’s Consultative Assembly’s Special Trial on 1998, stated, that humans are God Almighty’s creature, whose role is to manage and preserve the nature in harmony and

balanced with their loyalty to Him. Humans are blessed with the human rights alongside with the rights and responsibilities for them to ensure their existence, values of being human, and to keep a harmonious life. The perspective and behavior of the nation towards human rights which is based on the religion, universal moral values, and the nation's cultural value itself, are based on Pancasila and 1945 Constitution.¹⁵

Article 1 of the Human Rights Charter contains a stipulation regarding the rights to live which stated as, "Each person has the right to live, to survive and maintain their lives". However, Article 36 contains a restriction regarding human rights, including the rights to live as stated as, "In implementing their freedom and rights, each person is obliged to comply to the restrictions stipulated by the Law for the sake of ensuring respect and acknowledgment of the rights and freedom of the others, and to meet fair demands in accordance with moral considerations, security and public order in a democratic society".

The preamble "in letter a" of UUPPLH/ Environmental Protection and Management Law states that: "A good and healthy environment is included within the human rights of Indonesian citizen as mandated in Article 28H of the 1945 Constitution of the Republic of Indonesia." In Article 3, the UUPPLH states that protection and environmental management aims: (1) to protect the area from environmental pollution and/or damage; (2) to ensure safety, health, and survival of human beings; (3) to ensure the survival of living creatures and the preservation of ecosystems; (4) to preserve environmental functions; (5) to achieve harmony and environmental balance; (6) to ensure justice for the present and the future generations; (7) to ensure the fulfillment and protection rights of the environment as human rights; (8) to control the use of natural resources wisely; (9) to establish sustainable development; and (10) to anticipate global environmental issues.

If observed closely, the provisions of the UUPPLH and its legal policies intend to protect and manage the environment so that humans can develop according to their dignity. Also, this law emphasizes that the right to obtain a good and healthy environment is a basic human right.¹⁶

Regarding the right to a good and healthy environment, the provisions of Law Number 40 of 2007 concerning Limited Liability Companies can

be observed, in which this law also regulates social and environmental responsibility. In Article 74, it is specifically stated that "The Company which carries out activities in the field and/or relating to natural resources is obliged to carry out social and environmental responsibility". From contextual perspective, companies are also burdened with social and environmental responsibility, such as companies whose objectives and activities are to explore natural resources. Forms of the said social responsibility may vary, the most important is to "rescue" the natural resources, whose balance is increasingly disrupted. The government begins to consider this as an urgent matter, given the impact may affect the lives of many people.¹⁷

The lack of the same perspective regarding the environment roles as a life buffer arises a sectoral and short-term approach in its management. There is a tendency for environmental damage escalation due to not considering the integrity of human beings and the environment. The environment is only interpreted as a static object with no human interaction. The rights of the people to a good and healthy environment and the obligation of the state to guarantee citizens' constitutional rights are not being properly depicted as related to various technologies in order to suppress the environmental damage.¹⁸

The rights to a good and healthy environment is closely related to a number of other human rights, such as:

a. the rights of housing, mainly related to the fulfillment of habitability principle (residential comfort). In the General Comments of the Committee on Economic, Social and Cultural Rights/CESCR, it is stated that, "inadequate and deficient housing and living conditions are invariably associated with higher mortality and morbidity rates". To ensure the fulfillment of the right to the people, the government is obliged to coordinate between the ministers and local authorities in formulating policies related to economy, agriculture, environment, energy, etc.);

b. the rights of food, particularly in relation to the government's obligations in formulating environmental policies which can support the fulfillment of the said rights for food. Poor hygiene in the environment may both directly and indirectly end up as a major hazard for food safety;

c. the rights for education. The CESCR states that, “Education has a vital role in empowering women, safeguarding children from exploitative and hazardous labour and sexual exploitation, promoting human rights and democracy, protecting the environment, and controlling population growth”;

d. the rights to a healthy work environment;

e. the right of each human being to be provided with prevention, treatment, and supervision of disease outbreaks; and

f. the rights for water. The fulfillment of this right aims to realize a number of other rights, including the rights to the environment.

The right to a good, healthy and balanced environment in the UUPPLH, specifically becomes the authority and responsibility of the government in its implementation, by: (1) regulating and developing policies in the framework of environmental management; (2) regulates the supply, designation, use, protection, management of the environment, and the reuse of natural resources, including genetic resources; and (3) regulating instruments for preventing pollution and/or environmental damage.

Conclusion

Prevention and control of environmental pollution and damage requires cooperation and integration. The legal aspects of environmental management and conservation of natural resources in Indonesia need to be studied intensively, this is where the environmental law roles as the agent of stability and the agent of development/agent of change takes place. The prospect of environmental law in realizing the development of a healthy society in Indonesia is something that is unable to be negotiated as a healthy environment is a part of human rights which is guaranteed in the UDHR/ Declaration of Human Rights and the Constitution of the Republic of Indonesia (1945 Constitution), which is set out in the Act Law Number 32 of 2009 concerning Environmental Protection and Management.

Measurement of Lipid Profile in Fasting Persons

Adhraa Baqir Hassan¹, Hayder L. F. AL-Msaid¹, Arshad noori ghani Al-dujaili¹, Haider Salih Jaffat¹

¹University of Kufa, Faculty of Science, Department of Biology, Al-Najaf, Iraq

Abstract

This study was performed within the DM center in Al-Sadder Teaching Hospital in Al-Najaf province to see the impact of not having breakfast for males in relation with Diabetes Mellitus sort two and supermolecule Profile. This study includes (25) male that not having breakfast, and (5) male that thought to be management cluster. (The results show important increase ($P \leq 0.05$) in abstinence glucose, cholesterol, acylglycerol, LDL, lipoprotein and high-density lipoprotein in comparison with management group).

Keyword: Mellitus type two, supermolecule Profile, Breakfast.

Introduction

Breakfast is the first meal of each day, most frequently eaten within the early morning before enterprise the day's work⁽¹⁾. Among English speakers, "breakfast" will be accustomed discuss with this meal or to discuss with a meal composed of ancient breakfast foods (such as eggs, dish and sausage) served at any time of day. The word virtually refers to breaking the fasting period of the previous night⁽²⁾. Breakfast is that the most significant meal of the day has been spoken by innumerable moms throughout the ages. it's been voiceless within the ears of faculty youngsters on early-to-rise mornings for hundreds of years, however the depth of understanding on why breakfast is thus necessary has solely been delivered to light-weight in recent years. The aspect effects of not intake breakfast negatively impact weight, secretion health, memory, noesis and mood⁽³⁾. According to the studies conducted on the negative effects of not eating breakfast, that people who skip the morning meal they had the chances higher for the exact opposite of the goal of slimming. Skipping breakfast increases the craving for sugary and fatty foods, in addition hunger pangs will be intense, and ultimately will deal with whatever comes in front of we during the day due to high levels of hunger and the greater the amount of food intake stab to overcome the daily calories recommended, and the increase

continued to skip breakfast eventually lead to weight gain, not weight loss⁽⁴⁾. Avoiding breakfast can have negative effects on energy and mood, help we avoid breakfast can reduce our energy levels and adversely affect our memory⁽⁵⁾. Skip breakfast make we abound in eating during the day, which in turn paves the way for the increased prevalence of obesity that a person who suffers from overweight or obese have an increased risk of cancer⁽⁶⁾. Hypoglycemia is a medical term used to refer to lower blood sugar levels, skipping meals lead to a significant drop in blood sugar levels, in turn, causes the release of hormones that can compensate for low levels of sugar, that on the other hand increases the pressure levels blood, causing headaches and migraines. The incidence is highest when neglect breakfast, because it is the first meal of the day, which consumes about 12 hours of fasting⁽⁷⁾. Meal containing low levels of the protein can affect the keratin levels, reduce hair growth and cause hair loss, breakfast is the perfect meal any day, and has a great role in promoting hair follicle growth, so if you want to enjoy a strong and healthy hair with the disposal of hair loss, you have to deal with a breakfast rich in protein per day should⁽⁸⁾. people who eat breakfast have a higher metabolic rate that skipping breakfast will cause low blood sugar levels, causing headaches and nausea⁽⁹⁾. DM is a metabolic diseases cluster characterised by symptom ensuing from defects in insulinaction, hormone secretion, or each of them. symptom if his a Chronic have metabolic disturbances and DM cause impact on tissue and organ harm also as disfunction involving the, kidneys, nervous, tube-shaped structure systems and eyes⁽¹⁰⁾. the foremost common kind of polygenic disease is sort two polygenic disease.

Adhraa Baqir Hassan

Email: adhraa.alshabawy@uokufa.edu.iq

over ninety nothing of individuals with polygenic disease have sort two. this type of polygenic disease is joined (with the older age, obesity, case history of polygenic disease, previous history of physiological condition polygenic disease, physical inactivity and ethnicity⁽¹¹⁾. Around eighty of people with kind two polygenic disease square measure overweight. sort two polygenic disease is more and more being analyzed in kids and teenagers. At the purpose once sort two polygenic disease is analyzed, the duct gland is often making enough hormone, however for obscure reasons, the body cannot utilize the hormone adequately, a condition known as hormone opposition. Following quite whereas, hormone generation diminishes. the end result is like for kind one diabetes-glucose develops within the blood and therefore the body cannot utilize its primary wellspring of fuel⁽¹²⁾. Supermolecule profile, additionally referred to as coronary risk panel or supermolecule panel, is that the collective term to the estimation of total cholesterol (TC), triglycerides (TG), rarity lipoprotein-cholesterol (LDL-C) and high density lipoprotein-cholesterol (HDL-C), accustomed assess risk of DM unwellness. associate degree extended supermolecule profile might embrace terribly rarity conjugated protein cholesterol (VLDL-C)⁽¹³⁾. The 2 main sorts of supermolecule within the blood square measure cholesterol and triglycerides that square measure incorporated within the lipoproteins that act as a vehicle for his or her transport. There square measure four major subtypes of lipoproteins that disagree in their mass, supermolecule and fat content, together with rarity lipoprotein-cholesterol (LDL-C), terribly rarity lipoprotein-cholesterol (VLDL-C), high density lipoprotein-cholesterol (HDL-C) and particle⁽¹⁴⁾. Dyslipidemia portrayed by raised complete cholesterol, LDL-C and brought down HDL-C, is an ordinary hazard consider watched myocardial dead tissue patients and is the significant reason for atherosclerosis are proposed to act synergistically with non-lipid hazard variables to build atherogenesis. Expanded TG and diminished HDL-C and the expanded TG/HDL-C proportion are considered as real hazard factors in the improvement of insulin opposition and metabolic disorder. The exactness of TG/HDL-C proportion in anticipating CVD hazard isn't appropriately by late research⁽¹⁵⁾.

Materials and Method

The study was conducted on at random designated (25) male that not having breakfast within the DM center in Al-Sadder Teaching town in Al-Najaf province. A group of (5) apparently management subjects were

enclosed as a healthy group. The age of males was vary of 35-65y . the data of males were obtained through a form consisted of the name, age, weight, Blood pressure .

Blood and humor collected from patient that which tests the flowing :-

1-Determination of abstinence glucose concentration (FBG)⁽¹⁶⁾.

2-Measurements of total cholesterol (TC)^(17, 18).

3-Measurements of Triglycerides (TG)⁽¹⁹⁾.

4-Calculation of rarity lipoprotein-cholesterol (LDL-C)

5-Calculation of terribly rarity lipoprotein-cholesterol (VLDL-C)

6-Measurements of high density lipoprotein-cholesterol (HDL-C)⁽²⁰⁾.

Results

The results of this Table 1 indicate a big increase ($P \leq 0.05$) in abstinence glucose (FBG) level, cholesterol (TC), Triglyceride(TG), LDL, lipoprotein and high-density lipoprotein in males that not having breakfast (338.411.21±, 357.5612.12±, 299.2411.55±, 255.56±12.21, 59.042.49±, 35.8±0.77) severally in comparison with management groups(931.09±, 2.30±104.2,67±1.09, 61.2±2.14, 13.4±0.21, 29.60.45±) severally.

Table 1: humor level of FBG and supermolecule profile elements in males while not breakfast and management teams.

Parameters	Mean±S.D	
	Males without breakfast	Control
FBG (mg/dl)	338.4±11.21*	93±1.09
Cholesterol (m mol/L)	357.56±12.12*	104.2±2.30
Triglyceride (m mol/L)	299.24±11.55*	67±1.09
LDL-C (m mol/L)	255.56±12.21*	61.2±2.14
VLDL-C (m mol/L)	59.04±2.49*	13.4±0.21
HDL-C (m mol/L)	35.8±0.77*	29.6±0.45

* means that important distinction at ($P \leq 0.05$)

Discussion

The study unconcealed a big elevation in abstinence glucose in patients comparison with management cluster as conferred within the table. These results square measure expected thanks to the very fact that the most characteristic feature of DM is symptom. glucose is tightly controlled by 2 key processes: hormone secretion by exocrine gland β -cells in response to a nutrient and hormone action on major target organs, i.e. striated muscle, liver and fat. T2DM, is usually related to fatness and results from scarce hormone production/secretion and hormone Receptor (IR)⁽²¹⁾. The results show that there's a big increase in humor cholesterin, triglycerides, LDL-C and VLDL-C in patients comparison with management cluster as conferred within the table. The dyslipidemia detected within the patients cluster square measure common in diabetic patients and has totally different explanations⁽²²⁾. In polygenic disease, glucose isn't used by tissues leading to symptom, the fatty acids from fat square measure mobilized for energy purpose and way over fatty acids is accumulated within the liver then reborn to triglycerides⁽²³⁾. The dyslipidemia of visceral fatness is that of will increase within the proportion of little dense low-density lipoprotein particles and elevated triglycerides. a rise in VLDL-C occurred in DM thanks to increase handiness of aldohexose for VLDL-C synthesis and reduce in conjugated protein enzyme activity resulting in decrease of VLDL-C from peripheral circulation. Active lipolysis in DM redoubled cholesterin synthesis resulting in the buildup of this compound within the walls of blood arteries⁽²⁴⁾. Visceral fat refers to intra-abdominal fat round the intestines and correlates with liver fat. Visceral fat has metabolic characteristics that disagree from that of body covering fat. it's a lot of metabolically active with relation to free carboxylic acid turnover; the redoubled flux of free fatty acids promotes IR at a cellular level and will increase viscus lipoprotein production and will increase adipocyte-derived free fatty acids prompting triglycerides accumulation in these tissues⁽²⁵⁾. The supermolecule abnormalities related to IR have an effect on all supermolecule fractions. they're characterised by elevated triglycerides levels, elevated postprandial triglycerides wealthy remnant lipoproteins, high HDL-C and high little dense low-density lipoprotein particles. This pattern correlates powerfully with vessel risk and treatment decreases this risk. Poor glycemic management is related to hypertriglyceridemia and in some patients, high humor LDL-C and high HDL-C concentration⁽²⁶⁾, 1990). The hypertriglyceridemia results from each redoubled substrate handiness (glucose and

free fatty acids) and faded lipolysis of VLDL-C on cet of expressed symptom and is believed to result partially to hyperinsulinemia⁽²⁷⁾. Elevated levels of supermolecule peroxide in DM could also be thanks to the alteration of perform of erythrocytes membrane. This inhibits the activity of SOD catalyst resulting in accumulation of superoxide radicles that cause the most supermolecule peroxidation and tissue harm in polygenic disease. the opposite necessary issue for the dyslipidemia in T2DM patients thanks to IR that is closely associated with cardiovascular disease, obesity, redoubled lipoprotein and triglycerides⁽²⁸⁾.

Legal Protection of Medical Records for Hospital Patients

Agus Prihartono Permana Sidik¹, Rani Sri Agustina¹, Wafda Vivid Izziyana²

¹Sultan Ageng Tirtayasa University, Banten, Indonesia, ²Muhammadiyah University of Ponorogo, Indonesia

Abstract

Providing Medical Records in a health service facility is one indicator of service quality at the institution. Based on the data in the Medical Record, it can be assessed whether the services provided are good enough or not, and whether they are in accordance with standards or not. Therefore in medical partners is a picture of the process of health care for every patient who goes to the hospital. Based on Article 1 of the Republic of Indonesia's Minister of Health Regulation No. 269 / MENKES / PER / III / 2008, that medical record is a file containing records and documents about patient identity, examination, treatment, actions and other services provided to patients. This means that the medical record is a systematic procedure given to the patient and the hospital patient's right to know.

Keywords: *Legal Protection, Medical Records and Hospitals*

Introduction

Good hospital services cannot be separated from the patient's medical record, where the medical record is written and recorded information about the identity, history, physical determination, laboratory, diagnosis and medical action given to patients whether hospitalized, outpatient or receiving emergency services. Medical records have a very broad understanding, not just recording activities, but also have an understanding as a system of organizing medical records that starts recording as long as patients receive medical services, followed by handling medical record files which include organizing storage and releasing files from storage for serving requests or borrowing from patients or for other purposes. Medical records are part of the archive that describes all activities by an agency within a certain period. The hospital must have a medical record as a standard of service in the health sector that is useful for improving quality in providing optimal services to all clients. The existence of records plays a significant role in determining policies and work guidelines for achieving the vision and mission of an agency. Medical records

have an important role to support the achievement of orderly administration in efforts to improve health services in hospitals and must be managed properly that is beneficial for patients, doctors and hospitals. Problems in the medical record will be seen as insignificant, but will greatly affect health services, as argued by Nugraheni.¹ Therefore, the existence of a medical record can provide health services according to standards based on the objective condition of the patient through his medical history.

Providing Medical Records in a health service facility is one indicator of service quality at the institution. Based on the data in the Medical Record, it can be assessed whether the services provided are good enough or not and whether they are in accordance with standards or not. For this reason, the government, in this case the Ministry of Health, felt that it was necessary to regulate the procedure for organizing Medical Records in a Minister of Health regulation to make it clear. Broadly speaking, the implementation of the Medical Record in the Minister of Health Regulation is regulated as follows (RI Minister of Health Number 269 / MENKES / PER / III / 2008):

1. The Medical Record must be immediately made and fully completed after the patient receives the service (article 4). This is so that the data recorded is original and nothing is forgotten because of the grace period.

Jl. Raya Serang - Jakarta, Panancangan, Cipocok Jaya, Serang City, Banten 42124

2. Every record of Medical Records must be affixed with the name and signature of the health service officer. This is needed to facilitate the system of accountability for the recording (Article 5), as opined by Nurani.²

Medical records recorded by the hospital must be known by patients as a form of patient rights.

Research Methodology

In research, the method is a means to measure the validity of research conducted by researchers. Therefore in this study related to “Legal Protection of Medical Records for Hospital Patients”, focus on the object of the medical record and the rights of hospital patient by conducting qualitative research and normative juridical approaches.

Findings and Discussion

Indonesia’s national goal is to advance public welfare, to educate the nation’s life, and to participate in maintaining world order as stated in the Preamble to the 1945 Constitution of the Republic of Indonesia. Public welfare itself means security, order, the fulfillment of needs and health. In order for a human being to live productively and be active, health is needed. In realizing health, surely efforts are needed such as promotive, preventive, curative and rehabilitative. Bambang Poernomo mentioned about health efforts in the health law that “health efforts are activities to maintain and improve health carried out by the government and or by the public by using the services of health workers,” as argued by Poernomo³ which is based on professional standards and services.

The hospital is an institution that plays a role in health care. Soekidjo Notoatmojo said that the organization of hospitals prioritized social functions that were intended:⁴

- a. Facilitate community access to health services.
- b. Provide protection for patient safety, the community, the hospital environment and human resources at the hospital.
- c. Improve quality and maintain hospital service standards.
- d. Provide legal certainty to patients, the community, hospital human resources, and hospitals itself.

According to Permenkes No.82 of 2013 concerning

SIMRS is a communication information technology system that processes and integrates the entire flow of hospital services in the form of a network of coordination, reporting and administrative procedures to obtain information precisely and accurately and is part of the Health Information System. SIMRS management must be able to improve and support the process of health services in hospitals including speed, accuracy, integration, service improvement, efficiency improvement, ease of reporting in operational implementation, as argued by Novia.⁵

The medical record is one of the most important pillars, so the organization of medical records must be managed with professional personnel. The role of medical records is needed to manage evidence of health services safely, comfortably, efficiently, effectively and confidentially. The medical record unit is one of the units in the hospital that plays an important role in providing patient data and information related to health services received by patients. The quality of health data and information is important to consider. Quality data and information obtained from the performance of good medical records officers, as opined by Utami.⁶

The hospital as an individual health service facility is part of the health resources that are indispensable in supporting the implementation of health efforts. The delivery of health services in hospitals has very complex characteristics. In the era of globalization, hospitals need to prepare themselves to compete. The rapid development of science and technology (science and technology) has led to increasing public demands for hospitals to provide fast and professional health services to the needs of medical information. Hospitals must run medical records properly. In a complete and correct medical record, information can be obtained that can be used for various purposes. These requirements include evidence for court, education and training, and can be used for analysis and evaluation of hospital service quality. Given the many uses of medical records, it is necessary to control the filling out of medical record forms, according to Winarti.⁷

Medical record document storage system is one very important factor in providing services in hospitals. Medical record document storage system provides data availability about all services that have been provided to patients. Therefore, medical record document storage must be managed properly to be able to provide optimal service to patients. According to Permenkes 269 of 2008

concerning medical records, medical record document storage space can be used to accommodate active medical record documents for five years, whereas according to the Director-General of Medical Services Development in 2006 storing medical record documents is recommended or recommended to use the system centralized storage with the alignment of the final number system, as argued by Kusnadi.⁸ So that the patient's patient record will always be maintained, to find out the patient's history.

Improved health services are intended to increase awareness, comfort and ability to live healthy for every citizen in order to realize optimal health status as one of the elements of the general welfare as mandated in the opening of the 1945 Constitution of the Republic of Indonesia. Health Personnel as one of one main component of health service providers to the community has a very important role because it is directly related to the quality of service. Implementation of health efforts must be carried out by doctors and dentists who have high ethics and morals, justice and authority that must be continuously improved. One of the main elements in a prime health care system is the availability of medical services by doctors and dentists whose quality is maintained in accordance with the mandate of Law Number 29 of 2004 concerning Medical Practices. In the implementation of medical practice, every doctor and dentist must refer to the applicable standards, guidelines and procedures so that the community can obtain professional and safe medical services. By providing good services, it will lead to public confidence in hospitals and doctors.

In order to realize optimal health status for the whole community, it is necessary to improve the quality of health services which must be accompanied by adequate supporting facilities, among others through the implementation of Medical Records (hereinafter referred to as RM) in each health care facility in the form of examinations, treatment and care. Examination, treatment and care give birth to a legal relationship between the patient or his family with a doctor and / or hospital, which is recorded in the "Medical Record", according to Sudjana.⁹

According to Regulation of the Minister of Health No. 269/MENKES/PER/III/2008, the requirements for quality medical records are: related to the completeness of the contents of the medical record; accuracy; the accuracy of medical record records; punctuality; and fulfilment of legal aspects requirements. Meanwhile,

if referring to the hospital's minimum service standard (SPM) guidelines, there are four quality target indicators, one of which is the timely delivery of medical record documents, according to Winarti.⁷

In the implementation of health services, each hospital is required to provide quality services is the implementation of medical records. The role of the medical record is very important and is very attached to the service activities because such records are useful for recording the patient's condition, examination results and the actions given at that time. Today, the rapid development of technology has penetrated various sectors including health. In this case the researcher wants to examine developments in the medical record section, where the medical record is very influential in the implementation of patient services. Medical records will be a reference in the handling of patients let alone returning to treatment so that doctors can be easier, faster and more precise in the examination and treatment of patients. The medical record is an asset to ensure the smooth running of health services, therefore an electronic-based medical record (medical records information system) is needed that is easy to use and useful to help the doctor's performance inpatient care. Basically an electronic medical record is the use of electronic methods for the collection, storage, processing and accessing of medical records of patients in hospitals that have been stored in a multimedia data basis management system that collects various sources of medical data, as opined by Dharmawan.¹⁰

Realizing the application of electronic medical records, previously required the process of migrating paper medical records to electronic medical records, namely a series of processes that began with the introduction of electronic medical records and their benefits¹¹ and they were able to use them when providing services to patients¹².

Conclusion

Medical records are hospital actions performed on patients related to identity and related to the history of treatment given by doctors and hospitals to patients. With the existence of a medical record is an effort to provide the service standards needed for hospital patients. Medical records are regulated in 1 Regulation of the Minister of Health of the Republic of Indonesia Number 269 / MENKES / PER / III / 2008. Medical records are an effort to occur in the practice mall in the

field of health services for patients.

Abstract

Objectives: to evaluate the prevalence of significant coronary artery disease (CAD) in patients referred for open heart surgery for various valvular and non valvular etiologies.

Methods and materials: a total of 160 patients (73 males and 87 females) were included in this study: old age, male gender, hypertension (HT), diabetes mellitus (DM), hyperlipidemia, smoking and left ventricular (LV) systolic dysfunction are recorded as risk factors for CAD. Of the 160 patients: 143 (89.4 %) have valvular disease (VHD) and 17 (10.6%) have non valvular disease. Patients with VHD were classified according to valve lesions into: mitral stenosis (MS), mitral regurgitation (MR), aortic stenosis (AS), aortic regurgitation (AR), tricuspid regurgitation (TR) and mixed valvular disease. Correlation between various types of valve diseases and CAD are assessed.

Results: CAD were detected in 26.9% (43) of patients. Old age, HT, DM, hyperlipidemia and smoking were significantly correlated with CAD. CAD were more common in patients with VHD than non VHD. 25(50%) patients with AS have significant CAD (P value= 0.0001), in patients with MR: 8(12.7%) have significant CAD, while patients with MS and AR were have CAD in 15.1% and 25% respectively. Among patients with non valvular heart disease (17 patients): 13 patients have atrial septal defect and 4 patients have atrial myxoma. 3 patients (6.1%) have significant CAD (P value=0.2), one of them had HT, DM and smoker man presented with chest pain on exertion.

Conclusion: Obstructive CAD were more common in patients with AS and MR and higher in patients with risk factors for CAD.

Key words: coronary artery disease, valvular heart disease, Aortic stenosis.

Introduction

Many patients referred for surgical correction of valvular and non valvular heart disease have concomitant asymptomatic coronary artery disease (CAD)(1). Lytle et al. (2), and Karp et al (3) observed and recommend that complete revascularization is superior to no

revascularization in patients with valvular heart disease and CAD. In such patients valve replacement and CABG is associated with A significant reduction in mortality, Therefore, it is desirable to identify CAD in patients presenting for valve surgery. Coronary angiography (CAG) remains the gold standard for identifying such patients (4). Due to its high negative predictive value, coronary CT angiography to exclude CAD may be an option in patients with low or intermediate pretest probability of CAD (5).

According to the American College of Cardiology/ American Heart Association (ACC/AHA) guideline

for the Management of Patients with Valvular Heart Disease (5) it is class I indication to perform coronary angiography before valve intervention in patients with symptoms of angina, objective evidence of ischemia, decreased LV systolic function, history of CAD, or coronary risk factors (including men age >40 years and postmenopausal women).

In our center coronary angiography is usually performed routinely in any patient more than 40 years of age before cardiac valvular and non valvular surgery, this study aims to identify prevalence of coronary artery disease in patients with various valvular and non valvular scheduled for open heart surgery.

Patients and Method

This study includes 160 patients with age ≥ 40 years and various cardiac valvular and non-valvular diseases referred for heart surgery between October 2016 and January 2019 at ibn – albittar cardiac center, Baghdad, Iraq. Valvular heart diseases included rheumatic heart disease, mitral stenosis (MS), mitral valve prolapse (MVP), sclerotic aortic valve disease and bicuspid aortic valve (BAV). Non-valvular cases included atrial septal defect (ASD) and atrial myxoma. Patients with known case of CAD, prior CABG or percutaneous coronary intervention or age <40 years were excluded from the study.

Detailed assessment of symptoms such as chest pain, dyspnea, syncope, and fatigue and of risk factors like hypertension (HT), diabetes mellitus (DM), smoking and dyslipidemia was done in all patients. Etiology of cardiac disease was evaluated by transthoracic and if required, transesophageal echocardiogram with two dimensional and color flow imaging. All selected patients underwent coronary angiography and angiographic data was collected and assessed by at least two interventional cardiologist for presence or absence of significant coronary artery stenosis (defined as $\geq 50\%$ luminal narrowing of left main coronary artery, and $\geq 70\%$ narrowing for other coronary tree) and number of coronaries involved, decision made after discussion with cardiac surgeon to perform valvular surgery only or revascularization plus valvular surgery, then patients referred to surgical department.

Statistical Analysis

Statistical analysis was performed using SPSS 22.0 software (SPSS Inc., Chicago, IL, USA). Continuous

variables are presented as mean \pm standard deviation (SD). Means were compared using Student's ttests. Pearson Chisquare and Fisher's exact test were used to analyze differences in categorical variables. a P-value of < 0.05 was considered statistically significant.

Results

Table 1: Baseline characteristic of patients:

Age(year) \pm SD	56,1 \pm 9.8(y)
Gender, n(%)	
Male, n(%)	73(45,6%)
Female, n(%)	87(54,4%)
Hypertension, n(%)	72(45%)
DM, n(%)	44(27,5%)
Hyperlipidemia, n(%)	18(11.25%)
Smoking, n(%)	16(10%)
LV dysfunction, n(%)	7 (4,4%)
Valvular heart disease, n(%)	143(89.4%)
- Mitral Stenosis, n(%)	33(20.6%)
- Mitral Regurgitation, n(%)	63(39.4%)
- Aortic Stenosis, n(%)	50(31.3%)
- Aortic Regurgitation, n(%)	24(15%)
- Tricuspid Regurgitation, n(%)	2(1.3%)
- Mixed valvular heart disease, n(%)	29
Non valvular heart disease, n(%)	17(10.6%)
Coronary angiography:	
No Significant CAD:	117 (73.1%)
Significant CAD:	43(26.9%)
- single vessel disease:	24(55.8%)
- 2 vessel disease:	7(16.2%)
- 3 vessel disease:	11(25.6%)
- LMS lesion:	1(2.3%)

Table 2: Correlation between coronary artery disease and risk factors:

Risk factors	Total	Coronary angiography		P value
		CAD	No CAD	
Male gender, n(%)	73(45.6%)	30(41%)	43(59%)	0.0001
DM, n(%)	44(27.5%)	17(38.6%)	27(61.3%)	0.033
HT, n(%)	72(45%)	25(34.7%)	47(65.2%)	0.033
Hyperlipidemia, n(%)	18(11.25%)	7(38.9%)	11(61.1%)	0.02
Smoking, n(%)	16(10%)	11(68.7%)	5(31.2%)	0.0001
LV dysfunction, n(%)	7(4%)	2(28.6%)	5(71.4%)	0.6

CAD: coronary artery disease, DM: diabetes mellitus, HT: hypertension, LV: left ventricle. P value <0.05 is significant

This table showing the correlation between variable risk factors for atherosclerosis and prevalence of CAD, 30 males (41%) out of 73 males have CAD with P value= 0.0001. DM found in 44 (27.5%) of patients, 17 (38.6%) of them have significant CAD (P value =0.03). 72 patients had HT, 25 (34.7%) have CAD. Hyperlipidemia detected in 18 patients, 38.9% of them have CAD (P value= 0.02). 68% of smokers have significant CAD (P value= 0.0001)

Table 3: Correlation between coronary artery disease and indications for cardiac surgery:

	coronary angiography		Total	P value
	CAD	No CAD		
Mitral stenosis	5(15.1%)	28	33	0.065
Mitral regurgitation	8(12.7%)	55	63	0.001
Aortic stenosis	25(50%)	25	50	0.0001
Aortic regurgitation	6(25%)	18	24	0.5
Tricuspid regurgitation	2(100%)	0	2	0.07
Mixed valvular disease	6(22.2%)	21	27	0.3
Nonvalvular	3(17.6%)	14	17	0.27

CAD: coronary artery disease. P value <0.05 is significant.

This table show that CAD is most correlated with aortic stenosis (50%) with significant P value (0.0001) most of cases are due to degenerative sclerosis of aortic valve and associated with increasing age, 8 cases of mitral regurgitation have significant CAD (12.7%) with P value =0.001, while mitral stenosis which is mainly rheumatic in origin (15.1% with P value= 0.06), aortic regurgitation (25%, P value=0.5) are not significantly associated with CAD.

The two cases of TR have CAD, one of them was diabetic and treated with endocarditis of TV and then referred for surgery, second patient had sever TR secondary to sever rheumatic MS (mixed valvular disease).

Among patients with non valvular heart disease (17 patients): 13 patients have atrial septal defect and 4 patients have atrial myxoma. 3 patients (17.6%) have

significant CAD (P value=0.2), one of them had HT, DM and smoker man presented with chest pain on exertion.

Discussion

The prevalence of coronary artery disease among patients undergoing non coronary cardiac surgery range between 8.7 to 42.6% (1,6-8), and this associated with increases perioperative and postoperative morbidity and mortality if revascularization not done at same time during non coronary cardiac surgery, in our study we found that the overall prevalence of CAD is 26.9% (43 patients) among patients assessed by coronary angiography before cardiac surgery and this is comparable to Ayaz H. Shaikh et al, who showed in his retrospective study that ,Out of 144 patients, 99 (68.8%) found to have <50% coronary stenosis and remaining 45 (31.3%) had > 50% stenosis(9).

Ganesh N et al found that the incidence of coronary artery disease was 25% among patients with rheumatic heart disease referred for valvular cardiac surgery (8).

CAD was significantly higher in male gender, in association with DM, HT, smoking and hyperlipidemia and this is consistent with Jose G. et al (7), Deepak K. et al (10) and Cholenahally N. Manjunath et al (1) all mentioned that among patients with CAD the presence of increasing age, male gender, DM, HT, dyslipidemia and smoking were significantly greater as compared to those with normal coronaries.

In our study the presence of LV systolic dysfunction was not found to be correlated significantly with CAD (P value= 0.6) and this may be due to low number of cases (just 7 cases with LV systolic dysfunction versus 154 patients with normal LV systolic function).

The prevalence of CAD is higher in patients with valvular than patients with non valvular heart disease (27.9% Vs 17.6%) and this is consistent with Cholenahally et al (1) who found that among 300 patients CAD was found in 26 (8.7%) and CAD was more common in patients with valvular heart disease (9.3%) as compared with non valvular heart disease (3.3%).

The most common cause of aortic stenosis in adults is age related aortic sclerosis and calcification (11), atherosclerosis plays an important role in progression of aortic calcification and development of CAD. And explain the high incidence of CAD in patients with AS in our study (50%, P value= 0.0001). 8(12.7%)

patients with mitral regurgitation have CAD (P value= 0.001), CAD was detected in 5(15.1%) of patients with MS (P value= 0.06), AR is least correlated with CAD (6 patients with P value =0.5) and this consistent with Zeynep Y. Emren et al found that among 241 patients: Coronary artery disease was detected in 26.4% of patients with mitral stenosis and 57.7% of patients with aortic stenosis. Of the patients with mitral insufficiency, 41.9% had CAD, and 44.4% of the patients with aortic insufficiency had CAD (6).

Sonmez et al. (12) evaluated 760 patients who underwent valvular heart surgery, and they found occlusive CAD in 15.8% of the patients (p < 0.001), and the highest prevalence rate was noted in patients with AS (p < 0.05), a finding similar to that reported in the present study.

Conclusion

This study provide an idea about the prevalence of CAD among patients referred for non coronary cardiac surgery in our locality, although small sample used but it provided us with the high prevalence of CAD (26.9%) among those patients, and CAD is more frequent among patients with AS and in patients with multiple risk factors for atherosclerosis.

Incidence of Early Complications in Laparoscopic Total Thyroidectomy Vs Open Thyroidectomy Using Breast Approach in Simple Multinodular Goiter

Alaa Jamel Hasin¹, Muslim Kandel Kadeem¹, Kasin Tream²

¹Department of surgery , College of Medicine, University of Thi-Qar, Iraq ²GIT Subspecialty Surgeon, Al-Hussein Teaching Hospital

Abstract

Total thyroidectomy is a popular and common surgical operation in the world. It's done through collar incision that may culminate with bad cosmetic appearance for this type of wound in the neck. Recently laparoscopic total thyroidectomy has become popular in experienced laparoscopic hand surgeons. Among patients, we noticed many early complications that may occur after laparoscopic total thyroidectomy due to a new technique in total removal of thyroid gland to give an excellent cosmetic result. In our study we want to do comparative study for incidence of early complication (which occur within early 30 postoperative day) between LTT (laparoscopic total thyroidectomy) and OTT (open total thyroidectomy). The prospective study done to 122 patients who had total thyroidectomy for simple multinodular goiter. 58 patients underwent LTT and 64 patients OTT in GIT center in Thi-Qar city which are done by the same surgeon for all patients. Study done through 2 years 1/5/2017 till 30/4/2019 through breast approach and collar incision. Surgical outcome records the complications that occur to the patients within 30 days post-operatively. The main age of patients in LTT was 39.6 ± 6.4 and in OTT was 48.2 ± 8 ($p=0.04$). The operating time in LTT 125.4 ± 4 minutes while in OTT was 92.6 ± 2 ($p=0.03$). There were no significant differences in hospital stay in both groups. Patients with OTT experienced more pain than LTT group postoperatively as evaluated by a visual analog scale. Cosmetically group LTT were very satisfied with this procedure according to the questionnaire we used. The follow up period was 30 days only. Most of early complications are no significant differences between 2 groups as the LTT done by experienced laparoscopic hands. 2 cases (3.5%) only were converted to open procedure. Conclusion: LTT procedure is a new technique used to give an excellent cosmetic result rather than used collar incision in the midline of the neck, there are no significant differences in all early complications that may occur in LTT and OTT. LTT must be done by an experienced laparoscopic hand.

Keywords: Early complications, laparoscopic total thyroidectomy.

Introduction

Thyroid gland is one of the largest endocrine glands, thyroid disorder may cause thyroid enlargement (goiter) and some of enlargement need surgical removal of the gland⁽¹⁾ due to popular increase of the minimally invasive surgery. The laparoscopic surgery for the

neck and especially the thyroid gland increases also. Endoscopic neck surgery was first done by Gagner in 1996⁽¹⁾ while the Husker performed the first endoscopic thyroidectomy in 1997⁽²⁾. After that the procedure of LT and the approaches will develop rapidly and become different approach as axillary, breast, chest wall and submental^(3,4,5). At the beginning the LT was done for benign thyroid condition and contraindications for malignant thyroid disease⁽⁶⁾. However, endoscopic techniques present some difficulties in obtaining adequate surgical view because of the small working space and two-dimensional operative view⁽⁷⁾. The goals of LTT are to limit external scarring and improve

Phone: 009647831072028.

cosmoses, as well as, to reduce post-operative pain to enhance post-operative recovery⁽⁸⁾. The most common approaches used is axillary⁽⁹⁾ via breast, lateral, transoral^(10, 11, 12).

Material and Method

122 patients of 245 patients selected 58 with LTT and 64 patients with OTT, through 2 years from 1.5.2017 till 30.4.2019 through breast approach and collar incision, respectively. All operations of LTT and OTT performed by single surgeon assisted by two of the authors. Informed consent was obtained from all the patients preoperatively, the study was approved by the institutional review board of our hospital. Preoperative evaluation of all patients were done using ultrasonography, fine needle aspiration cytology to exclude malignancy conditions. Thyroid functions test, chest x ray, direct laryngoscope examination of vocal cord. The main surgical outcome measures were done at early complications that occur within 30 days' post operatively as, bleeding, recurrent nerve palsy,

superior laryngeal nerve palsy, seroma, hematoma, hypocalcemia, esophageal injury, conversion of LTT to open procedure, postoperative pain, operating time, duration and amount of drainage the data were analysis for statically significance using the student t-test and chi-square test. p-values <0.05 were indicated as statistically significant.

Results

The main age of the patients in group LTT was 39.6 ± 6.4 while in OTT was 48.2 ± 8 years ($p=0.004$) where the first group with LTT is younger than the other group, the operative time was shorter in OTT 98 ± 42 minutes while in LTT 128 ± 31.6 ($p < 0.01$) minutes. there was no significant differences in post-operative hospital stay (3.25 ± 0.93 vs 3.21 ± 1.23 days $p < 0.01$), with OTT was more painful VAS 7; $P=0.034$ while in LTT VAS 1 ($P=0.054$) (VAS 1 visual analog scale 1 day after the operation), about cosmoses the LTT group are very satisfied than the other group according to the questioner, other differences in post-operative complications are summarized in table 1.

Table1: The characterize and post-operative. Complications in both procedures of total

Complications	L.TT	OTT	P Value
Age(Years)	39.6 ± 6	48.2 ± 8	0.003
Operative Time	128 ± 31.6	98 ± 42	<0.01
Hospital Stay	3.25 ± 0.93 days	3.21 ± 0.871 day	0.447
Duration of Drainage	3 days	1 day	0.576
Amount of Drainage	moderate	mild	0.79
Bleeding	2/58	1/64	0.01
Rln Injury	2/58	1/64	0.01
Sup. L N. Injury	1/58	0/64	0.003
Seroma	5/58	1/64	0.584
Hypocalcemia	2/58	1/64	0.01
Oesophageal Injury	1/58	0/64	0.003
Conversion to Open	2/58	--	--
Post-Operative Pain	3/58	10/64	0.932

The post-operative complications of both groups were checked, through the first 30 post-operative days. Regarding to the recurrent laryngeal nerve palsy 2 cases with LTT and one case with OTT all of patients return to normal voice and hoarseness gone with the first 22 days followed by indirect laryngoscope examination appear normal vocal cord. One case in LTT get superior laryngeal nerve palsy which also return to normal high pitch voice after 28 days post-operatively. Seroma more occur 5/58 patients occur with LTT vs 1/64 in OTT which all disappear gradually without intervention. One case on LTT get esophageal injury which also treated conservatively. the cosmetic result was evaluated by using scoring system (1. extremely 2. fair 3. Normal 4. Not at all), other complication no significant differences finding between two groups.

Discussion

Laparoscopic total thyroidectomy (LTT) is a new technique in our country as a part of minimal invasive surgery. This procedure done through breast approach in our center. it's done by single corresponding surgeon help by other 2 authors. It gives an excellent result as cosmoses with no significant differences in complications occur as comparing with the traditional open technique. This type of surgery has been growing recently in the world due to improvement of laparoscopic instruments and improve in surgeon experiences provide minimally invasive surgery even to the thyroid tumors (13) endoscopic neck surgery was attempted by ganger in 1996(2). The first laparoscopic thyroidectomy was performed by (3) Since then various methods including axillary, breast, anterior chest approaches, have been introduced by many surgeons. (14, 15) Most of comparative studies reported that there was no significant difference regarding to the technical safety between LTT and OTT and they found that LTT have very good cosmetics results (7, 16, 17, 18, 19). There are many researches emphasized on laparoscopic removal of malignant thyroid gland, indications and contraindications (20). In our study, we talk about laparoscopic thyroidectomy in symptomatic simple multi nodular goiter including toxic goiter after return the patients medically to the au thyroid state. The incidence of recurrent laryngeal nerve palsy after OTT is reported to be 0% to 6% and the permanent nerve palsy less than 1% (21, 22) but in our study (transient nerve palsy 3.4% in LTT while 1.7% only in OTT this high percentage decrease with the time due to increases of hand experiences in laparoscopic procedure. while hypocalcemia in our study (3.4) in LTT while in open

1.7% this also transient which return to normal after 28 days. One case 1.7% got esophageal injury which occur on first case only treated conservatively. This complication not mention in any previous researches, we don't know why which may occur in early cases done by laparoscopic surgeons. Human and his colleagues reported disadvantages of endoscopic thyroidectomy with thyroid diseases and thyroid cancer (16, 22) . The operating time for LTT is longer in our study than OTT this time were decrease gradually with the increasing laparoscopic experiences. Seroma occur more common in LTT in our study which resolve spontaneously without intervention, so laparoscopic thyroidectomy was safe and effective for treating of benign symptomatic goiter.

Conclusion

Laparoscopic total thyroidectomy using breast approach is a safe minimally invasive surgery that give outcome similar to the open total thyroidectomy and give very good cosmetics result

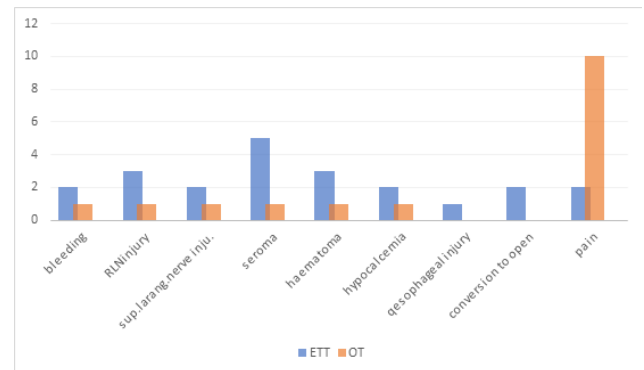

Fig 1: Shows the differences of early complication between LTT and OTT

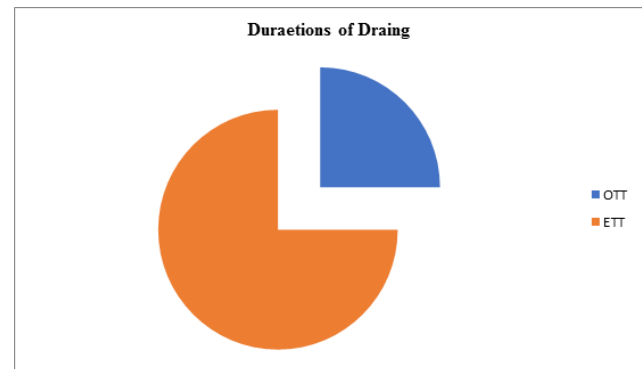

Fig 2: Duration of drainage in OTT one day only while in ETT is 3 days

Molecular Detection of Mutations in mtCOX1 Gene in Iraqi Patients with Aortic and Mitral Valve Diseases

Ali Jumaa Al-Hussona¹, Faizah A.W. Ahmed²

¹Ministry of Education, Directorate of Education, Dhi Qar / Iraq,

²Department of Biology / College of Education for Pure Sciences / University of Basrah/Iraq.

Abstract

Many evidences suggest that aortic and mitral valve diseases are not a direct result of aging but may be linked to various genetic factors. This study was designed to determine the potential role of mutations in certain mitochondrial genes and their association with aortic and mitral valve disease. The study included 31 patients, 16 with aortic valve defect and 15 mitral valve patients in addition to 20 healthy volunteers as comparative group. The results of the molecular analysis showed that there were 11 mutations of those with an aortic valve, seven silent mutations and two mutations recorded for the first time in the present study at the sites m.6922 G>T; p.W340L, m.6690 G> C; p.G263R and deletion mutation at m.6936 delA site recorded at the clinical variation site with accession number SCV000845763 and one insertion mutation at m.6908 insG site and registered with accession number SCV000845764. The results of the study recorded 12 mutations of the mitral valve eight silent mutations and the other significant mutations at sites m.6253 T>C; p.M117T, m.6366G>A; p.V155I, m.6690G> C; p.G263R and deletion mutation m.6607 insT site registered with the accession number SCV000852048.

Keywords: aortic valve, mitral valve, mtCOX1, novel mutation.

Introduction

More than 250,000 heart valves defects patients worldwide have been treated by heart valves replacement (¹). Although heart valve disease is less common than coronary artery disease or hypertension, it is still a common disease and surgical intervention is often required because treatments for infected valves are limited, and studies on valve diseases are still few compared to other heart diseases (²). Cardiac valve diseases, both congenital and acquired forms are contributing factors leading to death (³). The prevalence of these diseases increases with age, sex, high body mass index, smoking and hypercalcemia (⁴).as well many other factors such as rheumatic fever (⁵).

Most cell energy is produced in mitochondria by the oxidative phosphorylation (OXPHOS) of five multi-secondary complexes(⁶). The mutations in the

mitochondrial genome, especially in the genes that encode the cytochrome c subunits, associate with many clinical symptoms such as heart diseases (⁷). This complex has a key role in the process of producing energy and works to transfer electrons from cytochrome c to molecular oxygen, turning water into a water molecule (⁸).

Materials and Method

Case-control study was performed on 31 patients with aortic valve and mitral valve replacement operations at the Nasiriyah Heart Center in southern Iraq for the period from 2017 to 2018. The surgery was assessed through a test performed on patients at the same center. The number of patients were 16 (11 males and 5 females). The patients with mitral valve disease were 15 (8 males and 7 females) in addition to 20 comparative samples that were identical in age, sex, ethnicity and did not have a family history heart valves diseases.

The research and laboratory tests were approved by the Ethics Committee of the College of Education for Pure Sciences / Basrah University and the Ethics

Forty to fifty mg of valve replacement tissue were extracted for mitochondrial DNA. Extraction was performed by gene extraction kit equipped with Geneiad / south of Korea. A pair of primers were used to amplify a piece of the mtCOX1 gene starting at 5909 bp and ending at 6960 bp. The primers were designed by Primer3plus program, [http://www.ncbi.nlm.nih.gov.primer3plus](http://www.ncbi.nlm.nih.gov/primer3plus) and was as follows:

Forward: 5'-CGCCGACCGTTGACTATTCT-3'

Reverse: 5'- GGCCACCTACGGTGAAAAGA-3'

A PCR reaction was performed using 200ng for mtDNA and 5 pmol for each primer and 5 microliter from Master Mix supplied from Bioneer / south of Korea and 5 microliters of deionized distilled water. The first cycle of amplification program (first amplification) lasted for 5 minutes at 94C° and after 30C° Cycle 94C° for 45 seconds and 60C° for 30 seconds 72C° for 30 seconds after final elongation at 72C° for 5 minutes. The results

were then transferred to the 2% agarose gel. Samples were sent to Macrogen company, Seoul, South Korea for a nucleotide sequence analysis. Mutation Surveyer program V.5.2.1 was used by Softgenetics, USA to analyze mutations and detect their location on the mitochondrial genome and to determine whether it was nonsynonymous or synonymous.

Statistical Analysis

Statistical analysis of this study was conducted, using the P.value with 95% confidence intervals (95% CI) by SPSS V.18

Results

Results of the current study showed that the mean age of patients with aortic valve patients was 42.56 ± 15.80 and those with mitral valve 42.60 ± 12.09 . Comparison group age was 40.30 ± 11.50 , and the results also revealed an increase in the percentage of men with mitral valve which was 68.75% compared to females. The percentage of smokers with an aortic valve was 37.50% and those with mitral valve was 46.67%. Table (1).

Non-smoker	8 (40.00%)	10 (62.50%)	8 (53.33%)
P.Value		0.180	0.433

The current study found 11 mutation in patients with aortic valve, 7 synonymous mutations at the following sites: m.6446G>A, m.6671T>C, m.6680T>C, m.6170C>T, m.6531C>T, m.6026G>A, m.6272A>G. The mutation allocated in the two sites: m.6922G>T,p.

W340L and m.6690G>C,p.G263R were recorded for the first time (Novel) fig.(1). The study recorded a mutation of deletion at m.6936delA site and was registered at the site of clinical variations at the National Center for Biotechnology Information at accession

number SCV000845763 which led to frame shift mutation associated with protein alteration as well as mutation in m.6908insC, recorded with SCV000845765 accession number. table (2).

Discussion

The current study showed that the mean age of aortic and mitral valves patients was less than healthy controls at time of blood sampling for DNA extraction, but the difference was not significant, this is may be due to the small sample size. Mitochondrial genome accumulates mutations with progressing age, but our results showed no significant differences between aortic and mitral valve patients. Our investigation showed that the percentage of male aortic valve infection is significantly higher than that of females. These results are consistent with (9). Our findings did not show significant association between smoking and valve defects in the studied cases. Experiments with aortic valves patients identified 11 mutations in the COX1 gene Seven of these mutations were silent. The mutation m.6922 G>T p.W340L a m.6690G>C p.G263R was recorded for the first time and the study recorded a mutation at m.6936 delA site which was registered at the site of clinical variations at the National Center for Biotechnology Information at accession number SCV000845763, it causes frame shift mutation which led to the alteration of the resulting protein in addition to the m.6908 inC, which is registered as well at the clinical variation with the accession number SCV000845765.

For those with mitral valve defect, the study identified 12 variants, 8 of which were silent mutations, while the variant m.6366G>A; altered the amino acid

V115I and a deletion mutation at m.6607 delT resulted in frame shift mutation and recorded with SCV000852048. (10) found that the defect in the fourth complex in the respiratory chain is associated with many abnormalities that occur in the heart, muscles, and brain tissue. The defect in the complex involves the occurrence of deletions or mutations which are usually associated with age progression due to the presence of ROS free radicals antioxidants tissues due to aging, in his study a mutation at site 6708A>G in the COX1 subunit proved to be a termination code of the premature codon which led to the cessation of protein production component of the COX1 subunit. (11) noted that increasing formation of free oxygen radicals (ROS), especially hydrogen peroxide (H₂O₂), would promote increased calcification of the aortic valve and blood vessels due to increased calcium deposition in the valve. (12) found that mitochondrial functions were damaged in infected heart valves. (13) proved COX1 activity in patients with heart disease is lower than that in healthy people as well as that oxidative stress and imbalance in the mitochondrial genome are directly involved in several forms of heart disease. (14) recoded the mutation 7339A>G in the COX1 subunit in an anemic patient, leading to the formation of a termination codon in the wrong place. The study showed that this mutation resulted in poor oxidative phosphorylation rate in the mitochondria.

The mutations will destabilize the factors of the fourth complex of the respiratory chain in addition to

the mutations in the subunit are not the only defect in one complex but lead to a decrease in the respiratory chain efficiency when the mutation load exceeds a certain threshold (¹⁵). The presence of mutations will lead to structural changes in the protein produced by the subsidiary COX1 which cause the instability of the components of the fourth complex in the respiratory chain, which affects the biological synthesis of the peptide chains effect required for the functioning of this complex, especially mutations that change the amino acids, and the addition, which has caused a reading frame shift and therefore will lead to a defect in the heart valves efficiency due to lack of COX1 component or a defect leads to increase risk of heart valve defects.

Conclusion

The presence of missense, deletion, and insertion mutations which led to frame shift reading changes and that in turn could cause an aortic and mitral valve defects.

Acknowledgement: we would like to extend my thanks and gratitude to Dr. Aqil Salman Al-Mandil, Cardiac Surgeon at Nasiriyah Heart Center for his invaluable help. And thanks to Dr. Haidar Hussein Jalloud for analyzing the results statistically. We thank the patients and their families for their cooperation in the present study.

Ethical clearance: The research and laboratory tests were approved by the Ethics Committee of the College of Education for Pure Sciences / Basrah University and the Ethics Committee at the Nasiriyah Heart Center and obtained written approval by the patient.

Rubik Play Therapy Influence on the Level of Anxiety in Children Preoperative

Aprina¹, Meylani Anita Putri², Siti Fatonah¹

¹Lecturer-Department of Nursing, Health Polytechnic of Tanjung Karang,

²Alumnus-Department of Nursing, Health Polytechnic of Tanjung Karang

Abstract

Morbidity of children aged 0-21 years if it is calculated on the total population was 14.4%. Often Problems Arise before the operation is anxiety. Play an effective coping way to reduce the anxiety experienced by children. This study aimed to identify the effect of play therapy Rubik's on the level of preoperative anxiety in children in Room Kemuning Hospital Dr. Moeloek H.Abdul Lampung Province. The method used in the current research was the study design quasy experiment with one group pretest-posttest. Sample was selected by purposive sampling. Data collection technique used observation sheet, using a measuring instrument anxiety MYPAS (Modifiet Yale Preoperative Anxiety Scale). Data were analyzed using t-test. The average score of anxiety before the play therapy Rubik's was 73.40 and after therapy play Rubik was 52.10. The p-value = 0.000 (there was difference in preoperative anxiety scores before and after therapy using play Rubik).

Keywords: *Play therapy, Puzzle, Rubik, Anxiety*

Introduction

Surgery is an act of treatment using invasive way to open and display the body part to be handled. The opening of parts of the body is generally performed by making an incision. After the parts to be handled displayed, further improvements in the end with the closure and suturing wounds. Each surgical incision is always associated with a trauma for patients who cause a variety of complaints and symptoms.⁽¹⁾ According Muttaqin & Sari⁽²⁾ surgical procedure will provide for the patient's emotional reaction such as fear or feelings of calm, anger and fear. Mental preparation is of no less importance in the process of preparation for surgery anxiety due to mental patients who are not ready can affect physical condition. Mental problems that arise in the preoperative patient's anxiety.

Based on the National Health Survey (Susenas) in 2010, the incidence of surgery in children in urban areas

according to age group 0-4 years amounted to 25.8%, 5-12 years of age as much as 14.91%, age 13-15 years of about 9.1 %, age 16-21 years of 8.13%. Morbidity of children aged 0-21 years if it is calculated on the total population is 14.44%. Children who are hospitalized will have an effect on the physical and psychological condition, it is called with hospitalization.

Child care in hospitals forcing a child to be separated from the environment that feels safe, loving and fun, which is the home environment, games and playmate. Reactions to the show separation in preschool children is by refusing to eat, often asked, crying albeit slowly and uncooperative towards health workers. Child care in the hospital also makes children lose control of himself. Hospitalizations require restrictions on activities of children so that children feel lost power themselves. Fear of children against injury arises because children consider the actions and procedures threaten the integrity of the body. Therefore, this raises the aggressive reaction to anger and revolt, verbal expression with angry words, do not want to cooperate with the nurses and dependence in older people.

Small children, immature, and depending on the character's mother, is particularly vulnerable to the

anxiety associated with separation, for example children who are hospitalized (hospitalization) because the child has a sequence of fear development is the fear of losing a mother, fear of losing the love of a mother, afraid of injury to the body, fearing his impulses and anxious fear of punishment (punishing anxiety) of superego and guilt. Most children experience separation anxiety based on one or more of these fears.

The level of anxiety in inpatient in a hospital in the high category, there is even very high. The anxiety level should immediately get treatment so that children do not feel the stress is in the hospital. For the mind that stress will cause the child to be a long time recovering from the treatment being undertaken. Therefore, this form of therapy so that children feel comfortable in the hospital can be with the game.

Nurses can help parents face the problems related to child care in hospitals because nurses are next to the patient for 24 hours. The focus of nursing interventions is to minimize the psychological support to children of family members. One of the nursing interventions in addressing the impact of hospitalization in children is by providing play therapy. Play therapy can be done before performing the procedure on a child, this is done to reduce the tension and emotions felt by children during the procedure.

Although children got sick or hospitalized, the task of development does not stop. It aims to continue to grow and develop during treatment so that the continuity of growth can walk, can develop creativity and experience, children will easily adapt to the stress due to illness in the patient. The principle of playing at a hospital that is not much energy issue, consider the security and cross-infection, the age groups of the same age, the game does not conflict about the treatment, involving parents or family.

One alternative to distract children are hospitalized are in the presence of the support means to menfasilitaasi child's play to reduce the anxiety and fear that hospitalized children, because children are still happy to play.

The role of hospital health workers (doctors, nurses), which are expected health workers, especially nurses should respect the child's attitude because in addition to the elderly nurse is the person closest to the child during hospitalization. Even if the child refuses strangers (nurse), but the nurse must still provide support

by taking time to physically close to the child invited to play by the stages of child development for the benefit of the therapy.

According to Wong⁽³⁾ played an effective coping way to reduce the anxiety experienced by children. Play therapy helps release stress and anxiety being felt by children because play has merit as a means of distraction (distraction) that cause children to be relaxed. This leads to children who initially suffered anxiety becomes anxious again. Playing a good medium for learning because the children's playground will speak (communicate), learn to adapt to the environment, doing what they can do and about the time of the distance and the sound.⁽⁴⁾

In line with its growth and development, children have a gross and fine motor skills are more mature than the toddler age children. Children are more active, creative and imaginative. Similarly, the ability to speak and relate socially with friends is increasing. To that end, the right kind of plaything given to children for example, play Rubik, read a story / fairy tale, drawing tools and massive beams game.

Research Septi⁽⁵⁾ obtained marginal homogeneity with p-value of 0.000, all respondents, which decreased anxiety therapy after playing puzzle is severe anxiety 19 children become 0 child, anxious were 12 children to 11 children, mild anxiety 4 of children increased to 0 child, while not having anxiety as much as 5 children.

Data pre survey dated January 5 2019 in Dr.H.Abdul Moeloek Hospital, Lampung obtained information that the incidence of surgery in Kemuning Room in the last 3 months is the 120 children who will undergo surgery. Data showed 80% of children experience anxiety, such as crying when will do the nursing actions, asking to go home, it's hard to sleep, etc. Based on this phenomenon, the researchers will melakukam research on the effects on the level of play therapy Rubik preoperative anxiety in Kemuning Room.

Method

The method used in the current research was the study design quasy experiment with one group pretest-posttest. The population in this study was 30 boys of preoperative in hospitals Kemuning room Dr.H.Abdul Moeloek Lampung. Sample was selected by purposive sampling. Data collection technique used observation sheet, using a measuring instrument anxiety MYPAS

(Modified Yale Preoperative Anxiety Scale). Data were analyzed using t-test.

Findings

Table 1. Anxiety scores before and after given rubik play therapy

Variables	Mean	Median	SD	Min	Max	p-value
Before	73.40	73.00	7.407	53	86	0.000
After	52.10	53.00	10.380	31	65	

The mean-score of anxiety before therapy was 73.40, and after therapy was 52.10. The p-value of t-test was 0.000 (there was difference of the anxiety score between before and after Rubik play therapy).

Discussion

Most stress in middle age child preschool period is anxious because of the separation. Mother and child relationship is very close, resulting in separation from the mother will cause a sense of loss in children will be the closest to him and the environment are known to him, which in turn will give rise to feelings of insecurity and anxiety.

According to Wong⁽⁶⁾ as a result of separation anxiety in children that protest phase, the phase of despair and refuse phase.

Berberapa cause of anxiety before surgery in school age children appears tied to imagine the existence of injury on the body after surgery, This is in line with the opinions kathleen Speer⁽⁷⁾, which revealed that the hospital environment were strangers and surgery that will be undertaken, resulting in children will feel anxious during the preoperative period.

This study is in line with research conducted on 25-30 July 2016 in Room Children's Hematology Oncology Hospital Ulin Banjarmasin with sample 4 pre-school age children who will undergo chemotherapy, showed 2 of 4 anakmengalami anxiety while the other 2 did not experience anxiety.⁽⁸⁾

The role of hospital health workers (doctors, nurses), which are expected health workers, especially nurses should respect the child's attitude because in addition to the elderly nurse is the person closest to the child during hospitalization. Even if the child refuses strangers (nurse), but the nurse must still provide support by taking time to physically close to the child invited to

play by the stages of child development for the benefit of the therapy.

According to researchers the anxiety shown by the children in the room Kemuning of whom were children who experience anxiety responses characterized by crying, asking out of the wards, looking for a parent with a child's eyes and inactive. Based on the response of researchers to minimize anxiety by providing play therapy.

Preoperative anxiety in patients after therapy, play Rubik average anxiety scores of respondents was 52.10 with a standard deviation (SD) 10.380 and the lowest anxiety score was 31 (mild anxiety) and the highest anxiety scores was 65 (moderate anxiety). It showed a decrease in anxiety in children after playing Rubik's therapy.

Anxiety in children of the state becomes a matter of concern by parents causes anxiety may result in disruption of the growth process and can affect a child's behavior as it becomes difficult to eat, not calm, fear, anxiety and revolt when will do the nursing actions that can interfere in the process healing itself.⁽⁹⁾ For that according to (Huwari 2006) needs to minimize the anxiety by preventing or reducing the effects of anxiety. One way to minimize anxiety is by giving therapy.

Supartini⁽¹⁰⁾ explains that the play as an activity that can be done as a child and its development and growth stimulation plays for children in the hospital becomes a medium for children to express their feelings, relaxation and distraction feeling uncomfortable. Play activities carried out voluntarily to gain pleasure or satisfaction. By doing fun games can make children happy. According Nursalam et al.⁽¹¹⁾ with play will affect the health of a child.

This study is in line with research Septi⁽⁵⁾, entitled influence puzzles therapy against anxiety levels in

children who underwent hospitalization Medina hospital room Siti Khadijah Islam Palembang. In this study, data analysis results obtained using test marginal homogeneity test p-value of 0.000. And research shows that of all respondents totaling 35 children, which decreased anxiety after therapy puzzles are severe anxiety 19 children to 0 child anxiety were 12 children to 11 children, mild anxiety 4 children increased to 19 children, while do not experience anxiety children 0 to 5 children.

According to the researchers concluded that there are differences in anxiety scores before and after therapy play rubik, There is a difference between anxiety scores before and after therapy play rubik may be caused because the game rubik can train finger dexterity, hand-eye coordination, sharpen the brain, match the shape, the concept of cognitive, practice patience of children in developing rubik and relationships between parts of Rubik thus becoming rubik color shape intact.

Based on the statistical test anxiety scores before and after treatment with t-test playing rubik dependent with p-value of 0.000, it can be concluded that there pengaruh against child preoperative anxiety levels before and after rubik play therapy.

Anxiety is a major force in driving behavior. Good behavior normal and aberrant behavior, or impaired, both an expression, appearance, incarnation of defense against anxiety that.⁽¹²⁾ According Supartini 2004 while the reaction of preschool children who showed anxiety as the child refuses to eat, cry, often inquired about his situation, have trouble sleeping, uncooperative towards health workers when done nursing actions. The level of anxiety in the preoperative phase high enough children around 50-70% then diperluka way to prevent the child's emotional stress can be done in couple of ways including preoperative psychological preparation at the time (a day before the operation) where children and parents are given an explanation of the anesthetic and surgical techniques that will be undertaken the next day.

Playing is one way to reduce anxiety by playing children's anxiety is expected to decline. Small children generally respond better to the game and the kids are bigger respond better to a peer movie yangdlihatnya.⁽¹³⁾

Play therapy is an attempt to change problematic behavior, by placing children in situations of play. Play is a reflection of the physical, intellectual, emotional and social. Playing a good medium for learning because the

children's playground will speak (communicate), learn to adapt to the environment, doing what they can do and about the time of the distance and the sound.⁽⁴⁾

Play therapy is expected to break down the barriers, obstacles in esteem, stress, frustration and have an emotional problem with the aim of changing the behavior of children who do not fit into the behavior expected and the children were often invited to play will be more cooperative and easy to cooperation during the treatment period. Playing also be a good therapeutic media for children to develop their creative potential of children themselves, To reduce anxiety in children undergoing such hospitalization to do with relaxation, music therapy, physical activity, art therapy and play therapy.

In line with its growth and development, pre-school age children have gross and fine motor skills are more mature than the toddler age children. Children are more active, creative and imaginative. Similarly, the ability to speak and relate socially with friends is increasing. To that end, the right kind of plaything given to children for example, play puzzles / Rubik, read a story / fairy tale, drawing tools and massive beams game.

Rubik game selection in these games as rubik therapy is one of the educational games that can optimize the ability and intelligence of children. Rubik play teaches children to be patient and practice the skills of children in developing Rubik's color into the color Rubik's back intact. The benefits of playing puzzles / Rubik according to Beaty⁽¹⁴⁾ can train finger dexterity, hand-eye coordination, sharpen the brain, match the shape, the concept of cognitive, practice patience of children in developing puzzle / rubik and relationships between parts of a puzzle / rubik so as to form a puzzle / rubik intact

According Soebachman⁽¹⁵⁾ play Rubik is a game that consists of the colors from one side to train certain concentration levels. Play rubik can be done by children up to teenagers, but of course the degree of difficulty should be adjusted memainkanya child. Play Rubik child will try to solve the problem which is preparing colors.

This research is in line with the results of research conducted Kaluas⁽¹⁶⁾ shows the puzzle play therapy had a significant effect to reduce anxiety responses of preschool children during hospitalization which is obtained after therapy the mean value of a puzzle that is 28.71.

Conclusion

There are differences in anxiety scores before therapy and after receiving the play rubikrubik play therapy in pediatric patients pre-operatively.

The Surgical Outcome of Distal Pancreatectomy for Distal Pancreatic Tumors

Aqeel Shakir Mahmood¹, Waseem M shakir², Khalid Shakir kareem²

¹Department of surgery –college of Medicine/University of Baghdad,

²Gastroenterology and Hepatology teaching Hospital.

Abstract

Pancreatic cancer is still associated with poor prognosis and remains a therapeutic challenge and the fourth leading cause of cancer related mortality. Overall long-term survival is about 1–5%, and in only 10–20% of pancreatic cancer patients is potentially curative surgery possible, increasing five-year survival rates to approximately 20–25%.

Thirty two patients' data files were reviewed; those who underwent left sided pancreatectomy for tumor lesions in their pancreatic body or tail in Gastroenterology and Hepatology Hospital & Baghdad Teaching Hospital ,Baghdad, Iraq. for the period

from December 2013 up to April 2018. demographics , dates of presentation , ad-mission , presentation features , biochemical investigations , radiological findings , operative findings,histological reports of excised samples and clinical notes regarding postoperative hospitalization period with the postoperative biochemical and radiological findings were analyzed.

The result shows most of the resected lesions were benign premalignant tumors with female preponderance and lower mean age of presentation than found in other studies. No significant complications were documented and neither mortality nor recurrence were registered with thrombocytosis was the complication in one case . Successful celiac axis resection done in one case . Most of the cases operated in the 2015 with the non specific abdominal pain being the presenting symptom in more than 30 % of cases . Tumor site was in the tail in about 60 %, and the most common surgical option was distal pancreatectomy with splenectomy . Mucinous cystic neoplasia was the most common tissue diagnosis . Hospital stay was around 5 days in about 33 % of cases .

Key Words: *Pancreatic cancer, Gastroenterology, thrombocytosis, Tumor site.*

Introduction

Tumors of the body and tail of the pancreas comprise 33% of the pancreatic neoplasms. They have consistently been related with a pauper prognosis because of the late presentation, and subsequently, progress phase of the ailment. Be that as it may ,this pattern is continuously on the decay with the attention to the presence of these lesions, better radiologic imaging modalities for

analysis, and the more forceful treatment techniques received in these patients⁽¹⁾. Acinar neoplasms from pancreatic acini are uncommon , the ductal component of the pancreas is responsible for most of the neoplasms, with the invasive ductal adenocarcinoma as the most common neoplasm of the pancreas⁽²⁾. Pancreatic ductal adenocarcinoma accounts for 6% of all cancers in the United States. It is the fourth leading cause of cancer death in men, after lung, prostate, and colorectal cancer, and the fifth leading cause of cancer death in women, following lung, breast, colorectal, and ovarian cancer⁽²⁾. More than 42,000 incident cases of pancreas cancer are predicted annually, with about 35,240 deaths⁽³⁾. In the United States, the peak incidence of pancreas

cancer occurs in the seventh and eighth decades of life (3). Most pancreatic adenocarcinomas are solid, ill defined masses. They have a remarkable tendency for fast dissemination and insidious permeation. Ordinarily, it spreads in the abdomen in a multinodular design (intraabdominalcarcinomatosis) or is as of now broadly widely metastatic by the time the primary tumor grows to 5 to 6 cm in size. This feature is such characteristic that a larger solitary pancreatic mass is unlikely to be ductal adenocarcinoma (2).

Patients & Method

The data taken from the Gastroenterology and Hepatology Hospital & Baghdad Teaching Hospital registration unit & theatre unit were reviewed regarding patients who had underwent surgery for tumors involving pancreatic body or tail for the period from December 2013 upto April 2018, which included 32 patients, 4 of them were excluded because of missing data from

one of the data storage units The available informations were checked for demographics, dates of presentation, admission, presentation features, biochemical investigations, radiological findings, operative findings, histological reports of excised samples and clinical notes regarding postoperative hospitalization period with the postoperative biochemical and radiological findings. The data were studied by the statistical package for social sciencesprogram (SPSS).

Results

Study period

The data of patients with previous left pancreatic resection for distal pancreatic tumors retrospectively were collected For the period from April 2013 till April 2018 and the results showed 32 patients were explored, 6 of them with incomplete data who were excluded from the study, As shown in the figure (1).

Fig. (1): The annual resection rate for pancreatic body masses.

Demographic data

The demographic study shown the median age was 37.5 year and the mean age was 39 years. The maximum age was 57 years and the minimum was 17 years. And females were 66.7% and male were 33.3%.

Diagnosis

The most common symptom was abdominal pain that had been recognized in about 66.7% of the cases, followed by mass in 16.7% of the cases. (Figure 2 shows the presenting sympto

Fig. (2): The presenting symptoms.

Surgical option

There are many types of surgery, but the most frequently practiced surgery was distal pancreatectomy with concomitant splenectomy in the rate of 77.8%, followed by distal pancreatectomy with splenectomy and other organ manipulation. (as shown in figure 3).

Figure (3) :Types of surgery used for resection.

Tissue diagnosis

According to the results of diagnosis the resected tissues, pancreatic cystic lesions percentage around 49.7 %, and 77.77 % were benign (adenomas without dysplasia). while mucinous cystadenoma was encountered as the most common diagnosis with the frequency of 33.3% (figure 4).

Figure (4): Tissue diagnoses of the resected masses.

Complications

Regarding the postoperative complications’ rate which shown less than (30%), The group that managed without surgery by percutaneous drainage under local anesthesia whether by single or multiple attempts and with the use of injectable antibiotics with or without somatostatin inhibitors showed the highest frequency. (see figure 5). One case was complicated by thrombocytosis and gastrointestinal bleeding which was managed conservatively.

Figure (5): Postoperative complication .

Discussion

Perioperative morbidity and mortality rates are usually done after Pancreatic (4) and that’s why there is familiar idea that pancreatic resection for pancreatic cancer be abandoned. Many centers have developed recently and that’s had led to significant improvement in the short term outcomes after pancreaticoduodenectomy, these results were also extended to distal pancreatic resection

as evidenced by Fernandez-del Castillo et al (5). The data collected in this study showed zero percent of mortality and that’s could be explained by younger – middle aged population that was involved and also due to the less aggressively surgical options those were applied for carefully selected individual patients.

The figure (1) represents the increment of the annual rate of pancreatic surgical resection tumor we can noticed that the rate in 2015 year increased in 2-fold over that of 2014 (as mentioned previously in methodology this study did not cover the data of whole months of the years 2013 and 2018).

After calculating the median age of patients and appeared around 35 years and that's age lower than that found in another study held by Fabio Madureira et al (6) which was 57 years, And this controversy result can be explained by the fact that 34.1% of the cases are mucinous cystic adenomas and neoplasia of low - intermediate grade dysplasia which are commonly seen in perimenopausal women (7), which is the same cause for the female preponderance .

There were two recognizable periods by which the patients highly present to our center, the first in the 3 weeks' time and the second in the two years' time. The second period was affected by one case of metastatic tumor (carcinoma peritonei) who was already clinically diagnosed to have an advanced pancreatic tumor.

As excision thought to be the only chance of cure for the aggressive pancreatic cancer, and the survival highly improved by changing the operation to an extended distal pancreatectomy (DP) including resection of regional lymph nodes, retroperitoneal structures, surrounding vessels, and adjacent organs (stomach, spleen, colon, adrenal gland) cited by Matthias Glanemann et al (8).

This study has shown pancreatic cystic neoplasia as the most familiar diagnosis and this different to what was found by other reviews like in Keith D. Lillemoe et al (9) where the lesions due to chronic pancreatitis were the most common diagnosis representing about 24 % of the cases.

While postoperative complications rates were similar to or lower than those rates of Keith D. Lillemoe et al (9). 31% developed complications, in decreasing order, new onset insulin dependent diabetes, fistula, intraabdominal abscess, small bowel obstruction and hemorrhage , and this complication (the fistula) can be explained by the relatively high percent of distal pancreatectomies for chronic pancreatitis' associated lesions

Finally the length of postoperative hospital stay (with the cost that it carries) was generally lower in our review as compared with the results from Traian Dumitrascu (10)

where the mean was 9 days and the range from 6-45 days, while in Keith D. Lillemoe (9) the mean was 14 days, reflecting the time the complications needed to resolve within it .

Conclusion

Pancreatic tumors still representing a difficult medical problem for doctors in diagnosis , confirmation and treatment , but since distal pancreatectomy is relatively an easy surgery with an acceptable outcomes , the surgical oncological principles that limit the applicability of resection options should be over-come by both the detection of tumors at an earlier stages and the proper selection of the suitable surgical option for each individual case. Our results showed that the conventionally used procedure (distal pancreatectomy) is safe with an acceptable complications rate when used for benign or premalignant tumors with one modification need to be addressed that is spleen preservation. For malignant tumors this technique alone or with other modifications like (anterior or posterior) RAMPS or modified Appleby procedures may need to be part of the available options for the treatment of distal pancreatic malignancies.

Condition of Houses with Smoking Habits in Patients with Pulmonary Tuberculosis

Baharuddin Condeng¹, Muhammad Syafar², Saifuddin Sirajuddin³, Furqaan Naiem⁴, Azizah Saleh⁵

¹Doctoral Students, ²Health Promotion and Behavioral Science Department, ³Health Nutrition Department, ⁴Occupational Safety and Health Department, Public Health Faculty, Hasanuddin University, Indonesia, ⁵Nursing Department, Health Polytechnic of Palu, Indonesia

Abstract

Tuberculosis (TB) is one of the direct infectious diseases caused by the bacteria *Mycobacterium tuberculosis* which can attack various organs, especially the lungs. Pulmonary TB can be transmitted through the air, the longer and nearer a person contacts with the source of transmission, the greater the chance of contracting it. This study aims to describe the factors that can influence the incidence of pulmonary TB in patients at Undata Hospital, Palu. This study used a cross-sectional study design to describe the factors that influence the incidence of pulmonary TB in 15 patients with pulmonary TB MDR (Multi-Drug Resistant). The results showed that patients who had the most pulmonary TB were male (53.3%), aged or more than 40 years (53.3%), high school education level (46.7%), damaged house condition (73.3%), and have smoking habits (53.3%). Patients of the male sex, old age, high school education level, damaged housing conditions, and smoking habits are the most common factors for MDR pulmonary TB patients.

Keywords: tuberculosis, house condition, smoking habits

Introduction

Indonesia is included in the HBC (High Burden Countries) country because it has major problems in dealing with TB, countries with a high burden for TB are based on indicators of TB, TB / HIV, and MDR-TB (Multi-Drug Resistant). The 2014 tuberculosis prevalence survey showed that Indonesia was ranked second in the world as the largest contributor to TB patients after India. The prevalence of TB with bacteriological confirmation is 759 per 100,000 population aged 15 years and over, while the Palu area is 338 per 100,000 population⁽¹⁾.

The pandemic of Human Immunodeficiency Virus (HIV) / Acquired Immunodeficiency Syndrome (AIDS) in the world adds to the problem of pulmonary TB disease, co-infection with HIV will significantly increase the risk of the incidence of pulmonary TB disease. At the

same time the double immunity of tuberculosis germs against anti-tuberculosis drugs (MDR), is increasingly becoming a problem due to cases that have not been successfully cured⁽²⁾. TB drugs are a major public health problem threatening progress in TB care and control. Drug resistance arises due to antibiotic abuse in chemotherapy TB patients who are susceptible to drugs. This improper use is the result of a number of actions including the provision of improper treatment and failure to ensure that the patient completes all treatment. Basically, drug resistance appears in areas with weak TB control programs. A patient who develops the active disease with a type of drug-resistant TB can reduce TB to others.

In 2014-2016 around 89% of the world's population suffered from TB and 14 countries in the world experienced a double burden of TB such as sensitive TB, MDR-TB, and TB / HIV. WHO estimates around 480,000 cases of MDR-TB in 2013 with a mortality rate of around 150,000 cases each year⁽³⁾. TB is ranked fifth in the disease that causes death after stroke, heart disease, diabetes, and hypertension. In 2002-2020 an estimated 2 billion people will be infected with tuberculosis, 5-10% among infections will develop into disease, 40% among

Perintis Kemerdekaan Street, KM. 10, Makassar, Indonesia 90245

those who are sick can end up with death. The spread of tuberculosis is increasing in accordance with the increase and spread of HIV/AIDS and the emergence of MDR TB cases resistant to various drugs⁽⁴⁾.

The concept of the epidemiological triangle in TB cases, namely the factors of the host, agent and environment. Host factors consist of gender, age, education level, occupation, and smoking habits. The agent factor is mycobacterium tuberculosis. Factor environment conditions of the house, occupancy density and the presence of home ventilation. TB is an environment-based disease, influenced by environmental and behavioral factors. Environmental factors include ventilation, occupancy density, temperature, lighting, and humidity, while behavioral factors include the habit of smoking, spitting or removing phlegm in any place, coughing or sneezing does not cover the mouth and the habit of not opening the window^{(5),(6)}.

TB disease is exacerbated by poor housing sanitation conditions, especially in densely populated settlements. Transmission of TB can be through germs into the air in the form of droplet nuclei when coughing or sneezing, these sparks can survive in the air at room temperature for several hours and are inhaled through the respiratory tract. This survey aims to look at the condition of the home and smoking habits in patients with MDR pulmonary TB.

Method

This survey used a cross-sectional study design, which was to observe risk factors for tuberculosis in 15 patients with MDR pulmonary TB in the same time span in patients in Undata Hospital, Palu in 2019. Data collection was done by obtaining medical record data, conducting interviews and observing site habits and conditions live patients with MDR Pulmonary TB. The TB risk factors observed included: sex, age, education level, occupation, smoking habits, housing conditions, occupancy density, and the presence of home ventilation. The collected categorical data were presented in the form of frequency and percentage.⁽⁷⁾

Findings

The results of the research conducted at the Undata Hospital, Palu from January to June 2019, the number of patients with MDR pulmonary TB was 15 patients, the following results were obtained:

Table 1. Description of risk factors for MDR Pulmonary TB

Variable	f	%
Sex		
Male	8	53.3
Female	7	46.7
Age		
Old	8	53.3
Young	7	46.7
Education		
Elementary	4	26.7
Junior high school	2	13.3
Senior high school	7	46.7
Univeristy	2	13.3
Job		
Housewife	5	33.3
Civil Cervant	4	26.7
Private sector	6	40.0
House Condition		
bad	11	73.3
good	4	26.7
Smoking Habit		
Smoking	8	53.3
Not smoking	7	46.7
Total	15	100

Patients with MDR pulmonary TB who were male were 8 patients (53.3%) while female patients were 7 (46.7%). The age of the patient is as old as 8 patients (53.3%), while in young age there are 7 patients (46.7%). The highest level of education in pulmonary TB patients is high school as many as 7 patients (46.7%) and the least amount of higher education is 2 patients (13.3%). Most MDR pulmonary TB patients have private-sector jobs as many as 6 patients (40%), Housewives 5 patients (33.3%), and PNS 4 patients (26.7%). The home conditions of MDR pulmonary TB patients were the most, namely the condition of damaged homes by 73.3% and patients who had smoking habits as many as 8 patients (53.3%). All MDR Pulmonary TB patients live in homes that are densely populated and have ventilation.

Figure 1. Risk factors for MDR Pulmonary TB

Table 2. Cross Tabulation between Home Conditions and Smoking Habits of Patients with MDR Pulmonary TB

House Condition	Smoking habit			
	Smoking		Not smoking	
	n	%	n	%
Bad	5	45.5	6	54.5
Good	3	75.0	1	25.0
Total	8	53.3	7	46.7

Patients with MDR Pulmonary TB who have damaged home conditions and have smoking habits as many as 5 patients (45.5%) compared with MDR pulmonary TB patients who have good home conditions and do not smoke as much as 1 patient (25.5%)

Discussion

TB problems in the world are caused by poverty, malnutrition, endurance, slum settlement conditions, insufficient health facilities, late or lack of TB program costs, in Indonesia it is still difficult to control because it is related to social and economic problems. TB is related to poverty and population density. Densely populated and poor areas, meetings and not meeting the requirements of healthy homes, public awareness of environmental health is less. TB events are the result of interactions between environmental components, namely air containing tuberculosis bacilli with people who have habits and smoking behavior, contacts, with TB patients, immunization history, and occupancy density and other influences such as gender, age, nutritional status, socio-economic conditions and the condition of the house, namely the floor of the house, ventilation, lighting and humidity^{(8),(9)}.

MDR pulmonary TB patients are more male than female, this is because men have a greater risk than female patients. Male patients have smoking habits compared to women, thus worsening health conditions, especially lung conditions. TB attacks many productive ages and increases mortality in the community, especially in developing countries. productive age is the age at which someone is at the stage to work/produce something both for themselves and others. MDR pulmonary TB

patients aged over 40 years, at that age if they experience pulmonary TB, they can cause unproductive individuals to become a burden on their families.

Population density is one of the risk factors for TB, the denser the house is, the more difficult and faster the transmission of diseases, especially infectious diseases through the air. If there are family members who suffer from TB with positive smear who accidentally coughs. Mycobacterium tuberculosis bacteria will remain in the air for approximately 2 hours so that it has the possibility to transmit the disease to members who have not been exposed to tuberculosis bacteria⁽¹⁰⁾. The size of the house to occupants is closely related to the incidence of pulmonary TB, the denser the occupants of the house the faster the air inside the house is contaminated. The increasing number of residents will affect the oxygen level in the room, including humidity and air temperature. Increased oxygen in the home will provide an opportunity for mycobacterium tuberculosis to multiply and support transmission between occupants and sufferers.

Some countries such as Bangladesh, Vietnam, and Thailand have different pulmonary TB notifications for men and women, this occurs because of the stigma in the disease. Women do not seek treatment in health services because they are worried about the wrong assessment from the community. Pulmonary TB occurs in men because men have a smoking habit that makes it easy to contract pulmonary TB. Smoking habits can worsen TB symptoms, as well as passive smokers who smoke cigarette smoke, it will be easier to get infected with TB germs because cigarette smoke has a negative impact on lung resistance to bacteria⁽¹¹⁾. Africa, America, Southeast Asia, and the Western Pacific, most pulmonary TB patients are over 65 years old, while in Europe most TB patients are 45-54 years old. Factors contributing to the incidence of pulmonary TB are population factors (gender, age, socio-economic conditions) and environmental factors (density, floor of the house, walls, ceiling roofs, types of building houses, and fuel used in homes).⁽¹²⁾

The home condition has a major influence on the health status of its inhabitants, tuberculosis germs can live 1-2 hours and can even live for several weeks depending on ultraviolet light, good ventilation, humidity, home temperature and density of occupants of the house⁽¹³⁾. All MDR Pulmonary TB patients have homes that are densely populated and densely populated,

even though they are equipped with ventilation, but have not fulfilled the requirements of a healthy home, so that sunlight, air circulation, and house humidity support the life and transmission of tuberculosis germs.

Healthy homes are residential buildings that meet health requirements consisting of components of the house, sanitation facilities, have healthy latrines, landfills, clean water facilities, wastewater disposal facilities, good ventilation, residential density and the floor of the house not from the ground. Home is one of the basic human needs that functions as a place to live and a means of family development. Houses with environmental conditions that do not meet health requirements are risk factors for transmission of various types of diseases, such as tuberculosis. The tuberculosis germs live in moist conditions. Home conditions that do not meet health requirements, such as lack of lighting and inadequate ventilation, make germs easy to breed. The presence of tuberculosis bacteria in the house can trigger tuberculosis infection⁽¹⁴⁾.

Population density has a positive influence on the number of tuberculosis cases, the dense condition of the population will accelerate the spread of tuberculosis bacteria, which is one of the transmission media through the air. Population density will result in poor environmental conditions, poor nutrition, and low socio-economic conditions that increase the risk of tuberculosis⁽¹⁵⁾.

Conclusions and Recommendations

Patients with MDR Pulmonary TB in Undata Hospital, Palu the majority of the male sex, old age with high school education level, have the most damaged house conditions and have smoking habits. Patients with MDR Pulmonary TB need to pay attention to the conditions of their residence, especially their homes and stop smoking.

Diode Laser & Conventional Surgery Treatment, A Comparative Study in Anal Diseases

Basim Ghaib Hussein¹, Jameel I. Azzawi¹, Rabah Ali Hussein¹

¹M.B.Ch.B,FICMS (General Surgery), Department of Surgery, Collage of Medicine, Tikrit University. Tikrit, Iraq

Abstract

Anal pain is a common complaint, mostly of benign etiology but with psychological impact & interferes with life activities. The causes of anal pain usually can be easily diagnosed & treated with over the counter pain relievers & hot water soaks.

Aim of the Study: To compare the effectiveness of treatment with laser surgery to the traditional type of surgery.

Patients & Method: A prospective study was conducted on patients admitted to Samarra General Hospital & a private hospital from first of October 2017 to thirty one of May 2018. Ninety eight patients underwent different traditional & laser surgical procedures for hemorrhoids, anal fissure & fistula in ano. Of them, 68 patients (69.3%) were males & 30 patients (30.7%) were females with age range from 20-55 years (mean age of 32 year). The patients were divided into 2 groups:

Group A (49 patients) were treated by traditional method & Group B (49 patients) were treated by laser surgery.

Results: The laser surgery was less than traditional surgery in duration of operation by 17 minutes. For the intraoperative blood loss the laser surgery was less than traditional surgery. The infection rate was 1 of 49 cases in laser surgery while it was 7 of 49 cases in traditional surgery. The healing duration in laser surgery was less than traditional surgery. Duration of return to work was 22 days & 23 days in laser & traditional surgeries respectively. Finally the pain score according to numeric pain scale was mild for laser surgery & moderate for traditional one.

Conclusion: Laser surgery was better than traditional surgery in treatment of anal disease.

Key words: Laser surgery, Diode laser surgery, conventional surgery treatment, hemorrhoid, anal fissure, Fistula in ano

Introduction

Anorectal diseases are a group of medical disorders that occur at the junction of the anal canal & the rectum, these diseases are commonly encountered in general surgical practice. Patients with diseases of the anus & rectum are some of the most miserable people in the

world. These patients are usually in pain, often anxious & frequently embarrassed by the examination. Doctors need to be reassuring & explain clearly what is to be. Anorectal diseases are common, & their prevalence in general population is probably much higher than that seen in clinical practice as most patients do not seek medical attention¹. These affect men & women of all ages. The spectrum of anorectal disorders ranges from benign & irritating (pruritis ani) to potentially life threatening (anorectal cancer). The evaluation of patients is sometimes made difficult by nonspecific symptoms². The evaluation of anorectal diseases comprises of a careful history & physical examination before the patient

can be subjected to various investigations.

The scalpel and conventional electro-surgery unit are the instruments of choice for anorectal surgery. In addition, lasers are an alternative to conventional surgical systems. Scalpels have been used for many years because of their ease of use, accuracy, and minimal damage to the surrounding tissue. On the other hand, scalpels cannot provide the hemostasis that is helpful for use on highly vascular tissue³. One characteristic difference between a laser and scalpel cut is the generation of coagulated tissue layer along the walls of the laser incision⁴. All laser tissue interaction produce some degree of tissue vaporization and surrounding zone of thermal necrosis⁵.

This zone of thermal damage should ideally be kept to a minimum, as it may impede wound healing and graft take, and reduce tensile strength⁴. Advantages of this tool include greater precision, a relatively bloodless surgical and postsurgical course, sterilization, vaporization, and cutting, minimal or no suturing, and much less or no postsurgical pain⁶⁻⁸. The factors that determine the initial tissue effect include the laser wavelength, laser powder, the available laser waveform (continuous wave, chopped, and pulsed beams), and tissue thermal properties⁹.

Laser beams can burn or destroy healthy tissue, cause injuries that are painful and sometimes permanent. All of the above risks, precautions, and potential complications should be discussed by the doctor with the patient. The nature and severity of the problem, the skill of the surgeon performing the procedure, and the patient's general health and realistic expectations are among the factors that influence the outcome of laser surgery¹¹.

Patients and Method

A prospective study was conducted upon patients admitted into Tikrit Teaching Hospital and a private hospital from 1st of October 2013 to 31th of May 2014. Ninety eight patient underwent different traditional and laser surgical procedures for hemorrhoid, anal fissure, fistula in ano. Patients were divided randomly in to two groups: Group A (49 patients) were treated by traditional (scalpel) method, and Group B (49 patients) were treated by laser surgery. Different types of operations with different levels of complexity are done for example:

For hemorrhoids:

One pile are removed, two piles, three piles.

For anal fissure:

- Lateral internal sphincterotomy.
- anal dilation and skin tag removal.

For fistula in ano:

Fistulotomy, fistulotomy for low anal fistula and seton for high anal fistula.

All these operations are done after full preparation of the patients which include detailed history bright red painless bleeding mucus discharge, prolapse and pain. Examination and digital rectal examination (DRE), proctoscopy and sigmoidoscopy were performed. Full investigations are send (complete blood picture, renal function test, liver function test, viral cardiography for elderly patients. The operations are done under general anesthesia, spinal anesthesia, local anesthesia and the patients in the lithotomy position, patients were discharge within 4 to 12 hours, and were followed for 3 to 4 weeks for healing progress and complications.

Inclusion and exclusion criteria

Inclusion Criteria

1. Patients with hemorrhoid.
2. Patients with anal fissure.
3. Patients with fistula in ano.
4. Patients with anal fissure or fistula in ano associated with inflammatory bowel

Exclusion Criteria

1. Patients diagnosed with these diseases and associated with malignancy.

Preparation of the Diode Laser device

First, we have to check the device by observation of the continued type of electricity and the device should be loaded by load system, then when the device opened, we should put the program suitable for the type of the anal pathology. If the pathology is anal fissure or fistula we should press on the option of continues cutting as shown by program (1) and if the pathology is hemorrhoid we use either (continuous cutting) and we should ligate the pedicle with No. 0-1 vicry1, or in case of giving (impulse type) we should give each pile (7) Jull, the total power given is (21) if three piles removed which is the

maximum power you can give. Finally, the procedure is like the conventional surgery but with the use of laser instead of scalpel.

Results

In this series of 98 patients, the patients presented with hemorrhoid anal fissure, fistula in ano are operated on. The frequency distribution of cases in each group are according to gender and as shown in the table (1)

Table (1) Male and Female distribution of cases

Disease	Traditional Surgery			Laser Surgery		
	Male	Female	Total	Male	Female	Total
hemorrhoid	21	5	26	23	3	26
Anal fissure	10	6	16	6	11	17
Fistula in ano	4	3	7	4	2	6
Total	35	14	49	33	16	49

In hemorrhoid traditional surgery the range of time from (15-25) min. with mean time of surgery 20 minute while laser surgery the range of time from (12-18) min. with mean time 15 minute.

In anal fissure traditional surgery the range of time from (12-17) min. with mean time 15 minute while in laser surgery the range of time from (8-13) min. and mean time 9 minute.

In fistula in ano traditional surgery the range of time from (13-27) min. with mean time 18 minute while the laser surgery the range of time from (10-22) min. with mean time 12 minute.

Table (2) Intraoperative amount of blood loss/ ml

Disease	Traditional Surgery		Laser Surgery		Difference
	Range of blood loss	SD	Range of blood loss	SD	
hemorrhoid	(10-25) ml	20 ml	(8-17) ml	12 ml	8 ml
Anal fissure	(6-20) ml	10 ml	(4-11) ml	5 ml	5 ml
Fistula in ano	(7-20) ml	12 ml	(5-13) ml	7 ml	5 ml
Total		42 ml		24 ml	18 ml

It can noticed from table (2) the following observations:

- The amount of intraoperative blood loss was measured by weighing of the gauze. In which every 1gm= 1ml.

- In traditional hemorrhoid surgery the range of amount of blood loss from (10-25) ml, with mean amount of 20 ml. while the range of amount of blood loss from (8-17) ml with mean amount of 8ml in laser surgery.

- In traditional anal fissure surgery the range of amount of blood loss from (6-20) ml, with mean amount of 10 ml. while the range of amount of blood loss from (4-11) ml with mean amount of 5ml in laser surgery.

- In traditional fistula surgery the range of amount of blood loss from (7-20) ml, with mean amount of 12 ml. while the range of amount of blood loss from (5-13) ml with mean amount of 7ml in laser surgery.

Table (3) Rate of infection

Disease	Traditional Surgery			Laser Surgery		
	No. of infected cases	No. of operated cases	%	No. of infected cases	No. of operated cases	%
hemorrhoid	2	26	7.6	0	26	0
Anal fissure	2	16	12.55	0	17	0
Fistula in ano	3	7	42.8	1	6	16.6
Total	7	49	14.2	1	49	2.04

Figure (1) infection rate in traditional anal surgery

Figure (2) infection rate in Laser anal surgery

It can be notice from table (3) and Figure 1 and 2 the following observations:

- In traditional hemorrhoid surgery the number of infected cases were 2 of 26 (7.6%), while in laser surgery the number of infected cases were 0 of 26 (0%).
- In traditional anal fissure surgery the number of infected cases were 2 of 16 (12.55%), while in laser surgery the number of infected cases were 0 of 17 (0%).
- In traditional fistula surgery the number of infected cases were 3 of 7 (42.8%), while in laser surgery the number of infected cases were 2 of 6 (16.6%).

Finally the total number of infected cases in traditional surgery were 7 of 49 (14.2%), while the total number of infected cases in laser surgery were 1 of 49 (2.04%).

Table (4) Mean healing duration/Day

Disease	Traditional Surgery		Laser Surgery		Difference
	Range of Time	SD	Range of Time	SD	
hemorrhoid	(18-30) day	25day	(15-24) day	19day	6day
Anal fissure	(14-24) day	20day	(10-15) day	11day	9day
Fistula in ano	(14-27) day	21day	(12-18) day	14day	7day
Total		66day		44day	22day

It can be notice from table (4) the following observations:

- In traditional hemorrhoid surgery the range of healing from (18-30) day with mean time 25 day, while in laser hemorrhoid surgery the range of healing from (15-24) day with mean time 19 day.

- In traditional anal fissure surgery the range of healing from (14-24) day with mean time 25 day, while in laser anal fissure surgery the range of healing from (10-15) day with mean time 11 day.

- In traditional fistula surgery the range of healing from (14-27) day with mean time 21 day, while in laser fistula in ano surgery the range of healing from (12-18)

day with mean time 14 day.

Discussion

When the people think of surgery the first thing that comes to mind is the knife. The thought of being cut can turn many people off from getting much needed medical procedures. With the advancements in medical technology and the advent of laser surgery, more people can feel at ease when contemplating major surgery or simple cosmetic procedure. This may be used to seal off blood vessels to help reduce blood loss during surgery along with being able to help seal off infected areas. This is all done with minimal damage to the surrounding area¹².

The other advantage of laser surgery is that it may be used to seal nerve endings. This is especially helpful in reducing pain in areas that have undergone recent surgery. This makes it great alternative to pain medications and their side effects although this type of surgery is not without its own side effects¹².

There are several studies that were done for comparison between laser and traditional methods in anal diseases, but these studies are different either in laser type used such as CO₂ ⁽¹³⁾ or difference in the procedure itself ⁽¹⁴⁾. There is no similar of our work to compare with it for diode laser results, so we will compare just for traditional surgery results.

The present study revealed that total difference in duration time between the two methods was less in laser surgery by 17 minute for the three operations. The traditional surgical hemorrhoidectomy agreed with Towlait K. SM. (2012) ¹⁵.

For postoperative infection the difference was 6 patients less in diode laser surgery. Seven patients for traditional surgery (14.2%), and 1 patients for laser surgery (2.04%). The traditional hemorrhoidectomy method agreed with Uba A.F. (2004) ¹⁶. This decrease in rate of infection because production of an eschar layer¹⁷.

In our study we documented that the postoperative pain for traditional surgery was moderate according to (numeric pain scale), In our research in spite of differences that shown in duration of operation, intraoperative blood loss, wound infection rate, duration of healing, duration of return to work, and postoperative pain. The P value was more than 0.05 by SD.

By the analysis of our work we have found that the cause of being (not significant) because:-

1. Small sample size selection in comparison to this common conditions, because of short time for collection of data.

2. We compare the two procedure with three type of disease so the results more sub-divided that lead to be not significant.

3. In spite of decrease in blood loss with the laser surgery, the blood loss in traditional surgery is not large amount (collected procedure), so the difference is not sufficient to make the amount significant in this study.

4. In spite of the difference in the results of healing time and time to return to work but the small sample size and multiple diseases lead to be not significant.

5. As we mentioned, the postoperative pain is subjective experience, and measured by numeric pain score, so it was not examined by SD.

Conclusions

1. Decrease in duration of operation that is important for the patient and surgeon, which is also important in decreasing of time exposure to anesthesia.

2. In spite of small amount of blood loss in these operations the laser made it almost bloodless field.

3. The postoperative pain is very important for the patients, which also decrease the need for postoperative analgesia.

4. Decreasing the postoperative infection rate is very important for the patient early healing, early return to work and economically very effective.

Hypertension Control in Diabetic Patients

Bilal Jamal Kamal¹, Shan Nadhmi Nadhim², Muhammed Ali Khalaf³

¹Lecturer in Medical College Kirkuk University (Internal Medicine), ²Specialist Pediatrician at Kirkuk city,

³Assistant Professor in Medical College Kirkuk University

Abstract

Background: Diabetes mellitus is one of the commonest diseases world wide and can cause multi-systemic complications, hypertension can co-exist with diabetes and predispose to diabetes complications, both micro and macro-vascular.

Objectives: The objectives of this study are to assess the incidence of hypertension in diabetic patients and whether they are controlled or not.

Subjects and Method: This is a community-based descriptive cross-sectional study done in Azadi teaching hospital in Kirkuk city from the period of September 2014 until February 2016, 240 diabetic patients were collected using a questionnaire, containing details of his condition.

Results: The study had showed that in which 57% of patients were with high blood pressure, 32% with normal blood pressure and 11% with low blood pressure, most of the hypertensive patients were uncontrolled, and most of the diabetic patients were non-smokers and 55% of them were with non-sedentary life style, but the majority of them were overweight and obese.

Conclusions: The study agrees with a lot of studies that hypertension is more common in diabetic patients, especially in those who are obese and smokers and most of them are uncontrolled hypertensive.

Key Words: *Diabetes mellitus, hypertension, smoking, BMI*

Introduction

Diabetes mellitus is one of the most common a clinical syndromes in which hyperglycaemia happens as a result of absolute or relative deficiency of insulin. Carbohydrate, protein and fat, water and electrolyte metabolism all are affected due to insulin deficiency. Functional and structural changes in many organs particularly those of the vascular system, which lead to the clinical complications of diabetes. These characteristically affects the nervous system, the eye, vascular system and kidney.⁽¹⁾

There are two main types of diabetes mellitus, type 1, occur as a result of extensive damage to pancreatic

beta-cells and will affect the pancreatic insulin secretory capacity and the patient will depend on exogenous insulin. Type 2, which is much more common than type 1, there is some endogenous insulin secretory capacity; however their insulin secretion levels are low relative to their ambient glucose levels and magnitude of insulin resistance.⁽²⁾

Many factors contribute to the diabetes mellitus complication, e.g : diabetes control, smoking, hypertension.

Hypertension is a condition in which arterial blood pressure is chronically elevated. Blood pressure occurs within continues range ,so cut off levels are defined according to their effect on patients' risk.⁽³⁾

Diabetes mellitus and hypertension are interrelated diseases that strongly predispose an individual to atherosclerotic cardiovascular disease. Hypertension is about twice as frequent in individuals with diabetes as in

Corresponding author:

Iraq- Kirkuk-Alshorja-College of Medicine- department of Medicine. Mobile: 009647708594004

E-mail: belalkamal63@gmail.com

those without.(4)

Hypertension and diabetes are a critical combination for the development of both micro- and macro vascular disease.

Cardiovascular diseases is the major cause of mortality in diabetes mellitus. (4)

The prevalence of coexisting hypertension and diabetes appears to be increasing in industrialized nations because populations are aging and both hypertension and NIDDM incidence increases with age. (5)

An estimated 35% to 75% of diabetic cardiovascular and renal complications can be attributed to hypertension. For all these reasons, hypertension and diabetes should be recognized and treated early and aggressively. (1)

Subjects and Methods

This is a community-based descriptive cross-sectional study done in Azadi teaching hospital in Kirkuk city from the period of September 2014 until February 2016.

Data were collected from total number of 240 diabetic patients using structured questionnaires; the questionnaires were prepared in English and local languages questions were prepared (Arabic, Kurdish and Turkish).

The questionnaire contains important questions, type of diabetes, type of treatment, duration of diabetes, his diabetes is controlled or not, whether he is hypertensive or not, type of treatment, smoking history, sedentary lifestyle, body mass index (BMI) was measured for each patient.

Hypertension in diabetic patients was confirmed if systolic BP was equal or more than 130 mmHg and or diastolic BP equal or more than 80 mmHg on 2 occasions separated by at least 1 day or more, or on medications for hypertension.

Results

The study ended by collecting information from 240 patients have diabetes mellitus with its both types, 57% of which were females and 43% were males and the age for them was above 61 years old with a percentage of 42% of complete 240 patients.

Most of them (43%) had gained diabetes since 5 years ago, 23% were diabetic since 5-10 years, 22% since 10-15 years, and 12% were diabetic since >15 years.

90% of the patients are type two diabetes mellitus. the large population of them 73% are not controlling their diabetes also 54% of them don't have a family history of the disease.

Blood pressure measurements of the diabetic patients showed that 57% of them were with high blood pressure, 32% with normal blood pressure, and 11% with low blood pressure.

Table 1 shows the Distribution of study subjects according to age and diabetic patient with hypertension, diabetic patients < 30 years old were 6, non of them were hypertensive, patients aged (31-40): 9, 3 patients hypertensive, patients aged (41-50): 39, 16 patients were hypertensive, patients aged (51-60): 86, 40 patients were hypertensive, patients aged > 60 years old : 100, 70 patients were hypertensive.

Table 2 shows the distribution of study subjects according to hypertension and blood pressure measurement, high blood pressure was recorded in 83 patients (from total 128) of those who have diabetes and hypertension, and in 24 patients (from total 112) who have diabetes without hypertension.

206 patients (86%) were nonsmokers and 34 (14%) were smokers, 108 patients (45%) were with sedentary lifestyle and 132 (55%) with non sedentary life style.

The percentage of patients with controlled DM : 66 (27%) and uncontrolled DM : 173 (73%).

The ratio between the diabetic patients who are hypertensive : 129 (54%) and the others who don't : 111 (46%).

66 DM patients were controlled, in which 32 of them were hypertensive and 34 not hypertensive. 174 patients were uncontrolled DM, in which 97 were hypertensive and 77 not hypertensive.

According to these findings, relation between diabetic patients with or without hypertension and control of diabetes is not significant. Chi square =0.971, d.f=2, p>0.05

Table 4 shows the Distribution of study subjects according to hypertension and body mass index (BMI) measurements, low BMI (< 18.5) only 2 patients, both of them were just diabetic without hypertension.

Normal BMI (18.5 – 25), 48 patients, 20 of them were diabetics and hypertensives and 28 were just diabetics without hypertension.

Overweight (BMI 25 – 30), 90 patients, 49 were diabetic and hypertensives and 41 just diabetic without hypertension.

Obese (BMI > 30), 100 patients, 61 were diabetic and hypertensives and 39 just diabetic without hypertension.

Table 1 shows the Distribution of study subjects according to age and diabetic patient with hypertension.

Age	Diabetic & hypertensive	Diabetic only	Total
<31	0	6	6
31-40	3	6	9
41-50	16	23	39

Discussion

As diabetes mellitus is a common metabolic disease and can cause multi-systemic complications, an important factor that can precipitate diabetes complications is hypertension. ⁽⁶⁾

This study has found that hypertension was more common in diabetic patients (p <0.05) especially in old age diabetics (>60 years).(6,7,8,9,10)

Most of the diabetic patients had uncontrolled hypertension (57%), just 32% had controlled blood pressure, (8, 9)

As there are a lot of factors that can predispose to hypertension like smoking and sedentary life style and obesity so these important factors were screened in this study, 86% were non-smoker and 14% smoker, 45% were with sedentary life style and 55% with non sedentary life style. ^(11,12,13,14,15)

Of the 100 obese diabetic patients 61 were hypertensive and 90 patients were overweight of which 49 were hypertensive. ^(12,13,14)

Of the 129 diabetic and hypertensive patients, only 32 (27%) were controlled hypertensive and 97 (73%) were uncontrolled hypertensive.(16,17,18,19,20)

Hypertension was more common in diabetic patients, 129 (54%) diabetic patients were hypertensive and 111 (46%) were non-hypertensive. ^(21,22,23)

Conclusion

Hypertension is more common diabetic patients especially in old aged patients (> 60 years old), and most of the diabetics have uncontrolled high blood pressure.

Factors, such as: smoking, sedentary life style and obesity can all predispose diabetic patients to hypertension.

Recommendations:

Early diagnosis of hypertension and proper treatment with good control to reach ideal blood pressure in diabetic patients.

Educating diabetic patients to avoid smoking and sedentary life style, encouraging them to have regular exercise and eating healthy diet rich in fibers appropriate for diabetes, and have ideal body weight, as this can decrease risk of obesity which is also important risk factor for hypertension.

Avoid alcohol or advise patients to limit alcohol intake to a maximum of two standard drinks per day (men) or one standard drink per day (women) and have at least two alcohol-free days per week.

Ethical Clearance: Official agreement were obtained from the local ethical committee of

Kirkuk health directorate. Informed signed consent was obtained from each participant, data of the patients were collected in accordance with World Medical Association declaration of Helsinki, 2013 as a statement of ethical principles for medical research involving human.

The importance of Post-Mortem Computed Tomography (PMCT) as a Complementary Diagnostic Technique to Traditional Autopsy in a Case of Asphyxia Related-Death

Del Fante Z.¹, Di Fazio N.¹, Quattrocchi A.¹, Fazio V.¹, De Matteis A.¹, Arcangeli M.³, La Russa R.^{1,2}

¹Department of Anatomical, Histological, Forensic and Orthopaedic Science, Sapienza University of Rome, Italy, ²IRCCS Neuromed, Via Atinense 18, Pozzilli, 86077, Italy, ³Department of Life, Health and Environmental Sciences, University of L'Aquila, Italy

Abstract

Although asphyxia related-death is a common occurrence in forensic setting, traditional autopsy with neck dissection is not always sufficient to gain information about potential injuries of the deep structures of the neck.

In this case a 40 years-old white female was found unresponsive on the floor of her living room, in supine position with a widespread brownish area on her neck.

A preliminary PMCT examination showed a fracture line within the hyoid bone.

This finding was confirmed by the autopsy, which revealed soft tissue's haemorrhage of the sternocleidomastoid and sternohyoid muscles and a fracture of the right horn of the hyoid bone.

A 3D reconstruction of the event showed the aggressor standing behind the victim while holding his arm around her neck.

Our study demonstrates that, PMCT represent an effective aid to traditional examination techniques in order to visualize fractures. The former always requires to be associated with autoptic examination.

Keywords: *asphyxia, CT, autopsy, legal medicine, forensic medicine*

Introduction

Asphyxia related-death is a common occurrence in forensic setting. Indeed, this event can be related to suicide, homicide and accident.

Traditional neck dissection is not always sufficient to gain information about potential injuries of the deep structures of the neck¹.

Moreover, in these forensic cases, the external and internal examination aren't useful to obtain any sign which could help to distinguish between different mechanism of asphyctic death.

Since imaging could be better than autopsy in detecting some fractures, intracranial pathologies, and pneumothorax, the introduction of the post-mortem CT (PMCT) has given a great contribute to the field of postmortem diagnostics (e.g. gunshot wounds², sharp and blunt forces, etc.)^{3,4}. Because imaging alone cannot diagnose biochemical and toxicological causes, this technique should always be associated with a traditional post-mortem examination^{5,6}.

In particular, PMCT with 3D documentation can be very helpful in revealing injuries on the small structures of the neck, that can be masked by soft tissues and

surrounding bleedings and provides a useful guide for the pathologist in order to choose the right dissecting technique and avoid artifacts or iatrogenic injury to delicate structures, such as hyoid bone or thyroid cartilage¹.

Case Presentation

A 40 years-old white female was found unresponsive on the floor of her living room, in supine position. On the neck there was a widespread brownish area, that was more evident on the right side. During the investigation no mean was found that what compatible with an asphyxia dynamic.

Preliminary to the autopsy examination a PMCT was carried out. The 3D reconstructions were rendered using the software OsiriX® on a MacOSX® device. The CT was able to identify different features such as: fracture of the right horn of the hyoid bone with the fracture line running oblique. (Fig. 1).

External examination was carried out showing a well-developed body in an early stage of decomposition

(initial skin marbling).

Multiple lesions were found on different sites of the body surface consistent with blunt-force injuries.

Afterwards at the internal examination, a hemorrhage was revealed at the opening of the neck soft tissues. This infiltration was located on the right sternocleidomastoid muscle and right sternohyoid muscle. Neck *in situ* dissection, as previously detected by the post-mortem CT, showed a fracture of the right horn of the hyoid bone (Fig.2). Further investigations were conducted, comprehensive of histological and toxicological analysis. Whereas histological hyoid's bone specimens highlighted the presence of several markers of vitality, toxicological ones were negative. All these findings were consistent with an asphyxia-related death.

According to these evidences, a 3D reconstruction of the event was performed using the Poser Debut Software. It showed the aggressor standing behind the victim and holding his arm around the victim's neck (Fig.3). After the autopsy, this reconstruction was confirmed by the victim's husband (the aggressor).

Fig.1: PMCT reconstruction: hyoid fracture was detectable on the right horn with the fracture line running oblique.

Fig.2: Fracture of the right horn of the hyoid bone after layered *in situ* dissection of the neck structures.

Fig. 3: PMCT 3D reconstruction, using the Poser Debut Software, showed that the aggressor was standing behind the victim while holding his arm around the victim's neck.

Discussion

In forensic medicine, the term asphyxia describes a situation where there has been a physical obstruction between the mouth and nose to the alveoli, although other 'asphyxial mechanisms' exist, in which there is an inability to utilize oxygen at the cellular level without any physical airway obstruction⁷. Until this day, it has been proved that asphyxias' classification and the definition of various sub-types is not uniform⁸. Asphyxial deaths can be grouped into three categories: suffocation, strangulation and chemical asphyxia. These deaths might be accidental, suicidal or homicidal in manner.

Strangulation is a form of asphyxia which is caused from constriction of the blood vessels and the airways in the neck^{9,10}. Furthermore, according to the literature, strangulation can be classified as ligature strangulation (garroting) or manual strangulation (throttling) based on the mechanism used to commit it^{11,12}.

Manual strangulation is produced by pressure of the hand, forearm, or other limb against the neck, compressing the internal structures of the neck. The death is due to the occlusion of the blood vessels

supplying blood to the brain whereas occlusion of the airway plays a minor role in causing death. Virtually, all cases of manual strangulation are homicide¹³. In the forensic practice, autopsy with dissection of the larynx is the gold-standard to evaluate the presence of specific injuries, which are associated with strangulation. Nevertheless, such features are not always detectable at autopsy¹⁴.

PMCT is routinely used in forensic death investigations but its role is often limited to the assessment of skeletal injury, gas collections and foreign bodies^{15,16}. Thus, an imaging technique such as post-mortem TC could be useful to display characteristic findings, including a ligature mark, deviation of the hyoid bone, fracture of the hyoid bone, and fracture of the superior horn of the thyroid cartilage. Even though PMCT may not detect soft tissue injuries in decomposed remains or subtle internal hemorrhages in neck injury, it is more sensitive than autopsy in detecting subtle fractures¹⁷.

Moreover, the radiological documentation acquired before the autopsy allows the pathologist to choose the right dissecting technique and avoid artifacts or

iatrogenic injury to delicate structures, such as hyoid bone or thyroid cartilage¹⁸.

Conclusions

Our study demonstrates that, in the evaluation of strangulation deaths, PMCT is able to elucidate the essential internal injuries of the bony neck structures and may be equivalent to autopsy-only examinations in the detection of small and difficult to visualize fractures.

In this context, it is of utmost importance for forensic radiologists and forensic pathologists to know how to interpret discrepancies between PMCT and forensic autopsy. The judgment of discrepancies between PMCT and autopsy may influence the interpretation of relevant forensic findings, especially in case of medical liability¹⁹ and when a forensic case is issued in court.

Nevertheless, PMCT should not be performed alone. In fact, since PMCT remains only a support for forensic medicine practice, it always requires to be associated with autoptic examination.

Specifically, results from our experience and scientific evidence, suggest that PMCT scanning should be proposed in all cases of suspected asphyxia, as the screening approach of first instance to obtain preliminary information useful to rapidly develop the successive autopsy procedure, but it cannot represent an alternative way to the usual autopsy examination²⁰.

The Effect of Soot Particulate towards MAPK Expression in the Mechanism of Cardiovascular System Disruption

Dodit Yutanto

*Department of Cardiology and Vascular Medicine, Faculty of Medicine Universitas Airlangga,
Mayjen Prof. Dr. Moestopo Street no 47, Surabaya (60131), Indonesia*

Abstract

Background: Air pollution is associated with cardiovascular morbidity and mortality. An oxidative stress arising from particulate matter has been shown to activate a number of redox responsive signaling pathways in target cells. This pathway is involved in gene expression that plays a role in the response to inflammation and pathological changes including the expression of mitogen-activated protein kinase (MAPK).

Objective: To describe the effect of soot particulate exposure towards MAPK expression in the mechanism of cardiovascular disruption.

Design: This research was an experimental research by using “post test only control group design” approach.

Subjects: The experiment was conducted in laboratory female rats (*Rattus novergicus*) and consisted of 3 groups:

Methods: Control group -exposed by soot particulate with the concentration of 532 mg/m³ an hour each day for 30 days, without soot particulate exposure- (n=10); Treatment 1 group (n=2); Treatment 2 group -exposed by soot particulate with the concentration of 1064 mg/m³ an hour each day for 30 days- (n=12).

Results: The soot particulate significantly induced an increase in MAPK expression in the treatment 1 group (the number of immunoreactive cells: 51 (31-216) vs 2 (0-50), p=0.001; immunoreactive score (IRS) index: 2 (1-4) vs 1 (0-2), p=0.048) and in treatment 2 group (the number of immunoreactive cells: 73 (17-203) vs 2 (0-50), p=0.000; IRS: 2 (1-4) vs 1 (0-2), p=0.01) compared to control group. There was a significant increase in MAPK expression which was measured from the total number of immunoreactive cells in Treatment 1 (p=0.001) and Treatment 2 group (p=0.000) compared to Control group.

Conclusion: The Exposure to soot particulates significantly increased MAPK expression in experimental rats.

Keywords: soot particulate, mitogen-activated protein kinase (MAPK), oxidative stress, air pollution

Background

The particulate material in the air comprises a heterogeneous mixture of suspended solid and liquid

Corresponding author: Muhammad Aminuddin

Indonesia, phone : +6281999201024
email: muhammadaminuddin2018@outlook.com,

particles. These particulate material has various sizes and chemical compositions. The primary particles are released directly into the air like soot from a diesel engine ⁽¹⁾. The secondary particles are created through the psychochemical transformation of gases such as the formation of nitrate and sulfate from nitric acid gas and sulfur dioxide (SO₂) ⁽²⁾. Sources of particulate materials can be natural and man-made including motor vehicle emissions, tire fragmentation and resuspension of road dust, power plants and other combustion industries, smelting and processing of metals, agriculture, construction and combustion activities, household

wood burning, pollen, forest fires and agricultural waste, volcanic emissions and etc ⁽³⁾. Although there are thousands of chemicals that have been detected in particulate matter in different locations, there are more commonly found compositions such as nitric, sulfuric, carbon and organic carbon materials, organic compounds, biological compounds and various metals (for instance iron, copper, nickel, zinc, and vanadium) ⁽⁴⁾.

Soot is a carbon element (C) combustion product of an imperfect hydrocarbon. The perfect combustion will only produce water and carbon dioxide. Carbon is a chemical element which has the following characteristics: has atomic number 6, atomic mass 12.0107 nanomoles, classified as non metal with hexagonal chemical structure. Carbon has 6 electrons, 6 protons with isotope C-11, C-12, C-13, C14, C-15 and formed in combustion with low oxygen level. The sources of the soot producers are from inside and outside the room. The use of firewood as a fuel also produces considerable soot ⁽⁵⁾.

The soot exposure derived from the remnants of combustion products can affect health through various mechanisms. One of the mechanisms suspected to play a role is the occurrence of oxidative stress resulting in increased reactive oxygen species (ROS) or free radicals in the body. Soot exposure stimulates the release of inflammatory cytokines in addition to macrophages and leukocytes. The stimulation of soot to produce cytokines is associated with the activation of mitogen-activated protein kinase (MAPK) in cells which responds to inflammation ⁽⁶⁾. The occurrence of activation of MAPK will trigger the release of proinflammatory cytokines which will eventually result in extensive tissue damage in blood vessels. This condition can cause disruption of

the cardiovascular system ⁽⁷⁾.

Based on the elaboration above, the researchers are encouraged to conduct further studies in the effect of exposure to air pollutant particles, especially soot particulate on MAPK expression in the cardiovascular system through an experimental study using experimental rats.

Method

The experimental unit of this study was female white rats (*Rattus novergicus*) which fulfilled the research criteria of female rats (*Rattus novergicus*), aged 4 months (16 weeks), weight 100-200 grams, and healthy. The research was conducted at Biochemical Laboratory of Faculty of Medicine, Universitas Airlangga and Department of Veterinary Anatomy Faculty of Veterinary Medicine, Universitas Airlangga.

This research was an experimental research by using “post test only control group design” approach. It was conducted for 6 months with the stages included: giving particulate exposure for 30 days, laboratory animal surgery after the treatment, MAPK expression examination with immunohistochemical methods ⁽⁸⁾. The study protocol was approved by the Ethical Commission of Dr. Soetomo General Hospital Surabaya. The primary data which were immunoreactive cell quantities were tested for data distribution using Shapiro-Wilk test or One Way ANOVA parametric statistical test, followed by Post Hoc (Tukey HSD) statistical test. On the other hand, the abnormal data was examined by non-parametric statistical Kruskal-Wallis test and followed by Mann-Whitney U statistical test. The data analysis was processed by using SPSS software version 20 (SPSS, Inc., Chicago, IL) ⁽⁹⁾.

Results

Tabel. 1 The total number of immunoreactive cells

	Control n = 10	Treatment 1 (T1) n = 12	Treatment 2 (T2) n = 12
The Total Number of Immunoreactive Cells	8.20±15.25	77.08±79.63	83 . 33±59.40
The IRS index	1.10± 0.738	1.83±0.835	2 .33±1.073

Table above shows that there were two data of MAPK expression on rats' heart tissue examined with immunohistochemical technique which were: 1. The total number of immunoreactive cells in five fields of view in the form of ratio data, 2. The immunoreactive cell assessed with immunoreactive score (IRS) index in the form of ordinal data. The measurement results

of the average number of immunoreactive cells in the Control, Treatment 1 and Treatment 2 groups showed differences among groups [2 (0-50), 51 (3-216) , 83 (17-203)]. This immunoreactive score (IRS) index or Remmele scale was the result of multiplication between immunoreactive cell percentage score and color intensity score in immunoreactive cell ($\Sigma = A \times B$), with the score of 0-12.

Table 2. The Evaluation of MAPK Expression Using the Semi-quantitative Scale of according to Remmele and Stegner

	A (Percentage of positive cells)	B (Color reaction intensity)
Score 0	: No cells with positive reaction	No color reaction
Score 1	: ≤ 10% cells with positive reaction	low color reaction intensity
Score 2	: 11 – 50 % cells with positive reaction	Medium color reaction intensity
Score 3	: 51 – 80 % cells with positive reaction	Strong color reaction intensity
Score 4	: > 80% cells with positive reaction	

Table 2 shows that the brighter color reaction, the higher the score. When cells with positive reaction surpassed more than 80%, the color will be strong to indicate the level of positive reaction.

Table 3 The results of the number of immunoreactive cells and MAPK expression (IRS index) using Mann-Whitney test

	Control-Treatment 1	Control-Treatment 2	Treatment 1-Treatment 2
The results of the number of immunoreactive cells using Mann-Whitney test	0.001	0.000	0.507
The results of MAPK expression (IRS index) using Mann-Whitney test	0.048	0.010	0.217

The data in table 3 above is analyzed using Mann-Whitney test. There was a significant difference in the number of immunoreactive cells between control group and Treatment 1 (p = 0.001), and between control group and Treatment 2 (p = 0.000). However, there was no significant difference between treatment group 1 and Treatment 2 (p = 0.507) (table 3). The data analysis was

continued by using Mann-Whitney test. There was a significant difference in the MAPK expression between control group and Treatment 1 (p=0.048), and between control group and Treatment 2 (p = 0.010). However, there was no significant difference between treatment group 1 and Treatment 2 (p = 0.217).

Table 4. The results of Kruskal-Wallis test from the number of immunoreactive cells and MAPK expression (IRS index)

	Chi-Square	df	Asymp. Sig.
The results of Kruskal-Wallis test from the number of immunoreactive cells	15.849	2	0.000
The results of Kruskal-Wallis test in MAPK expression (IRS index)	8.003	2	0.018

Table 4 above shows that the total number of immunoreactive cells in five fields of view was a numerical variable; thus, the normality test was performed. The normality test used was the Shapiro-Wilk test because the number of samples in all three groups <50. The result showed that immunoreactive cell data had abnormal distribution ($p < 0.05$); therefore, the transformation and normality test were re-performed. The Normality test also showed abnormal distribution ($p < 0.05$) so that for analysis of difference of mean number of immunoreactive cell between group used Kruskal-Wallis test. There was a significant difference of the average number of immunoreactive cells among groups with the significance value of $p=0.000$.

The MAPK expression which was assessed by IRS index was in a form of ordinal data; therefore, the normality test was not performed. The data analysis applied was non parametric statistic Kruskal-Wallis test. There was a significant difference of MAPK expression among groups with significance value $p = 0.018$.

Discussion

The current evidence suggests that particulate matter (PM) has oxidative properties and induces oxidation-dependent changes in inflammatory cells, such as alveolar macrophages, which are involved in the formation of ROS. The continuous formation of ROS results in oxidative damage towards cellular components and can alter its function. Oxidative stress induced through translocated particulates or released materials has atherogenic effects directly ⁽¹⁰⁾.

These effects include the oxidation of lipoproteins, which are involved in the process of atherosclerosis. The oxidative stress in blood vessel walls can disrupt endothelial function through the consumption of nitric oxide (NO) or cofactors. The oxidation and nitration of

proteins and DNA are also associated with the progression of atherosclerosis ⁽¹¹⁾. The phagocytosis of air suspended particles activates the transduction pathway that triggers the MAPK cascade and the transcription factors. The exposure to particulate materials will activate Jun N-Terminal Kinase (JNK) and p38 MAPK on different cells. Exposure to bronchial epithelial cells by diesel exhaust particle (DEP) will activate JNK and IL-8 production induced by p38 MAPK ⁽¹²⁾.

The activation of p38 MAPK will cause the activation of NF- κ B. JNK MAPK is often involved in c-Jun phosphorylation and subsequent activation of the AP-1 transcription factor. Another study reported that the activation of these transcription factors (NF- κ B and AP-1) occurred after the exposure to airborne particles. NF- κ B is a major transcription factor that controls apoptotic processes and regulates the transcription of various gene products ⁽¹³⁾. Thurston on his research (2008) shows that inhalation of PM2.5 in rats caused the upregulation of several NF- κ B-mediated genes, including TNF- α , IL-6, and transforming growth factor β (TGF- β). Ultrafine carbon black (a compound of the PM10 ultrafine fraction) will induce greater oxidative stress in lung cells than fine carbon and can stimulate transcriptional activation of NF- κ B21. Pourazar et al. in his study showed that high-dose DEP exposure (high doses (300 μ g / m³ for 1 hour) can activate both NF- κ B and AP-1. In the most recent study, DEP exposure increased EGF-R expression and phosphorylation of tyrosine residues (Tyr 1173), activated JNK, AP-1, p38 MAPK, NF- κ B pathways and downstream signals as well as stimulated cytokine production ⁽¹⁴⁾.

In this study, there was a significant increase in MAPK expression which was measured from the number of immunoreactive cells in Treatment 1 group ($p=0.001$) and Treatment 2 group ($p=0,000$) compared to Control group. This finding is in accordance with

previous research data that particulate matter has the ability to generate oxidative stress and activate the MAPK cascade. The analysis of MAPK expression between treatment group 1 and treatment 2 showed no significant difference ($p = 0,507$).

The measurement of MAPK expression based on the IRS index also obtained similar results. There was a significant increase in MAPK expression in the Treatment 1 group ($p = 0.048$) and Treatment 2 ($p = 0.01$) compared to the control group. However, there was no significant difference between treatment group 1 and 2 ($p = 0.217$). Thus, there was a significant increase in MAPK expression in the Treatment 1 and Treatment 2 groups compared to Control group based on the number of immunoreactive cells as well as the IRS index⁽⁷⁾. The results of this study are in accordance with the previous studies. These findings support the hypothesis that exposure to soot particulates can increase MAPK expression in the mechanism of cardiovascular disruption⁽⁶⁾.

An interesting result was obtained between the Treatment 1 and Treatment 2 groups that showed an insignificant difference based on the number of immunoreactive cells and the IRS index. This was likely due to an increase in non-linear MAPK expression with an increased dose of soot particulate exposure⁽¹⁵⁾. Another possibility is that it took longer exposure time to elicit a significant difference MAPK expression at the dose of exposure to particulate substance as in this study. Therefore, a further study is required to be conducted with various exposure dosage and exposure time of particulate materials.

Conclusion

Based on data analysis, there was a significant increase of MAPK expression in rats' heart tissue as the result of exposure to soot particulate. However, this increase in MAPK expression was not linear with an increased dose of exposure to the given particulate material. These findings suggest the possibility of an important role of oxidative stress and pro-inflammatory line activation as a response to soot particulate exposure. The findings in our study are important in explaining how particulate matter, especially soot, can contribute to cardiovascular cases.

Ethical Clearance: The research process involves animals as subject of research that was accordant with the ethical research principle based on the regulation of

research ethic committee. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, nonmaleficence, and justice.

Conflict of Interest: There is no report of conflict of interest involved with this study so far.

Source of Funding: This study is funded by authors' fund only without external funds or donation.

Synergy of Government and Regional Government Authority in Providing Health Guarantee for Communities in Indonesia

Fatkul Muin¹, Rully Syahrul Mucharom¹, Wafda Vivid Izziyana²

¹Faculty of Law, Universitas Sultan Ageng Tirtayasa, ²Faculty of Law, Universitas Muhammadiyah Ponorogo

Abstract

The main idea of the government was to form a special institution to handle social security for the community in 2004, which was through the Social Security System Act. With the provisions of this law, in 2011, the Republic of Indonesia Law No. 24 of 2011 concerning the Social Security Organizing Agency (BPJS) and implementing regulations. On another aspect, the social security system is certainly difficult to implement if the system is not integrated between the central government and regional governments. With an integrated system, a social security system in the health sector will be built, this is in line with Law No. 23 of 2014 concerning Regional Government, where one of the concurrent affairs in the health sector. The purpose of this research is to analyze the synergy of the authority of the government and regional governments in implementing social security in the health sector by using qualitative methods and normative juridical approaches.

Keywords: *Health Insurance, Synergy, Government*

Introduction

Social and economic development as one of the implementation of national development policies has produced a lot of progress, including increasing the welfare of the people. The welfare must be enjoyed sustainably, fairly and equally to reach all people. ⁽¹⁾ In opening the 1945 Constitution of the Republic of Indonesia it was mandated that the aim of the state was to improve the welfare of the people. In the Fourth Amendment to the 1945 Constitution of the Republic of Indonesia, the objective was further emphasized by developing a social security system for the welfare of all people. ⁽²⁾ One form of social security provided in the health sector.

In order to improve health protection for the people of Indonesia, it is necessary to review the health service system, where health services are a mandatory part of responsibility Country given to the community. Health service is one of the fundamental rights of the

community whose provision must be carried out by the government as mandated in the 1945 Constitution article 28 H paragraph (1) Every person has the right to live in physical and spiritual prosperity, to live and have a good and healthy living environment and has the right to receive health services. Service is an activity that is invisible (cannot be touched) that occurs as a result of interactions between consumers and caricatures or other things provided by service providers that are intended to solve the problems of consumers or customers. ⁽³⁾ In the administration of government, which is based on the provisions of Law No. 21, 2014 regarding Regional Government, in general, the administration of health in the field of health is carried out jointly between the government and regional government, then jointly between the government and regional government, making the obligation for the government and local governments to fulfill the health of every citizen, especially for the poor.

In the provisions of Chapter II Determination of Criteria and Data Collection of the Poor and Poor People.

Section 2:

(1) The criteria for the poor and disadvantaged are determined by the Minister after coordinating with the

Address: Jl. Raya Serang - Jakarta, Panancangan, Cipocok Jaya, Serang City, Banten 42124

minister and / or leaders of the relevant institutions.

(2) Criteria for the Poor and Poor People as referred to in paragraph (1) shall be the basis for the institutions conducting government affairs in the field of statistics to conduct data collection.”

Section 3

“The results of the data collection of the poor and disadvantaged people carried out by institutions that carry out government affairs in the field of statistics are verified and validated by the Minister to be integrated data.”

With an integrated system, it is expected that the management of the health service system can be carried out significantly by the State.

Research Methodology

In research, the object of research is one of the instruments that needs to be the basis for efforts to determine the research method to be carried out by a researcher. In general, the research method used is doctrinal with normative juridical approaches.

Findings and Discussion

Fulfillment of the constitutional rights of every State in the field of health is an attempt by the State to carry out its obligations. Law Number 24 of 2011 which stipulates that social security is administered by the Social Security Assistance Agency (BPJS) consisting of BPJS Health, which is implemented from January 1, 2014, the National Health Insurance (JKN) as a health insurance system for all Indonesian citizens is carried out throughout health service agents ranging from hospitals to puskesmas aimed at all levels of society.⁽⁴⁾ With this institution, it is expected to be able to provide maximum health services to the community,⁽⁵⁾ so that the level of community welfare can be achieved.

The existence of BPJS Health as an Implementing Body is a public legal entity formed to organize a health insurance program for all Indonesians. The purpose of the implementation of the National Health Insurance program is to meet the proper public health needs provided to everyone who has paid contributions or whose contributions have been paid by the Government. With the Law No. 40 of 2004 concerning the National Social Security System, in 2011 PT Askes (Persero) was officially appointed as the Health Social Security

Administering Board (BPJS) which covers the health insurance of all Indonesians as stipulated in Law No. 24 of 2011 concerning BPJS. The National Health Insurance Program (JKN) organized by BPJS Health has started to be implemented since January 1, 2014.⁽⁶⁾ This period is the period of integration of the health system in Indonesia organized by the government through the Social Security Management Agency (BPJS) and the Regional Government through its Regional Stuan Organization Organization, namely the Health Office.

In the period of 2015 the implementation of the National Health Insurance Program in Indonesia has been carried out, but for 1 Year 3 months the implementation of JKN there are still a lot of homework that must continue to be addressed by the government and all parties involved. To achieve the National Social Health Insurance (JKSN / AKN) for all residents a comprehensive mapping is needed covering aspects of regulation, membership, health services, benefit packages, service networks, funding, management, and other resources. In the end, the progress of the JKN program will highly depend on public confidence in the performance of the BPJS as the main implementer of the JKN program. Complaints from participants, doctors, and other health facilities must also be accommodated.⁽⁶⁾ By accommodating the interests of all, it is expected to be able to provide health services based on public service standards and synergize government and local government policies.⁽⁷⁾

Law No. 40 of 2004 concerning the National Social Security System (SJSN) is the effort of the Republic of Indonesia in the field of legislation in ensuring the fulfillment of the right to health for the entire population. The law states that the government is responsible for the availability of services, the availability of access to both facilities and information, the availability of equal resources, and the seeking of feasibility and affordability in the health sector. Furthermore, the government is also responsible for administering health insurance through the national social health insurance system for each of its citizens. Sustainability of Law No. 40 of 2004 concerning SJSN is the issuance of Law of the Republic of Indonesia No. 24 of 2011 concerning the Social Security Organizing Agency (BPJS). The law explains BPJS consists of BPJS Health and BPJS Employment. BPJS Health is a government policy program to organize National Health Insurance. BPJS Health has been implemented since January 1, 2014. In the implementation of the BPJS program, there are many

obstacles faced by one of them the potential funding deficit which increases every year. Based on data from the Health BPJS in 2014 the BPJS experienced a deficit of 1.94 Trillion, at the end of 2015 the BPJS had a deficit of 5.85 Trillion and according to the Director of Development Planning BPJS Mundiharno the potential for deficit in 2016 was around 9.2 Trillion.⁽⁸⁾

In implementing the SJSN Law and the BPJS Law, the government implemented its policies through Government Regulations and Presidential Regulations, one of which is Presidential Regulation No.12 / 2013 on Health Insurance which experienced three changes, the first change being Presidential Regulation No. 111 of 2013, the second amendment to Presidential Regulation No. 19 of 2016 concerning Health Insurance and the third amendment to Presidential Regulation No. 28 of 2016 concerning Health Insurance. The second amendment to Presidential Regulation No. 19 of 2016 was carried out with the spirit to improve the conditions of the implementation of the National Health Insurance, among others, to meet the adequacy of contributions, regulate membership, regulate fines, regulate fraud prevention. However, in its implementation only within a period of not more than thirty days the Presidential Regulation was changed to Presidential Regulation No. 28 of 2016. Presidential Regulation No.19 of 2016 concerning Health Insurance has not yet had time to be implemented, it has been changed to Presidential Regulation No.19 of 2016 concerning Health Insurance. In the system theory described by Easton, a policy-making process begins with an input process that describes all requests that require a problem-solving solution, resources and support from the existing environment, all variables in the input process will be processed in a process to make a policy where in the process there will be dynamics of the policy making process and the interaction of the various actors involved² and produce its output in the form of a solution that becomes public policy. A policy analysis needs to be done to be able to see why the output of the policy change is happening so fast, because this process can perfect these National Health Insurance policies and can be implemented properly and in accordance with the constitutional and statutory mandates. The purpose of this study is to analyze the rapid changes in JKN policy; Presidential Regulation No. 19 of 2016 concerning Health Insurance becomes Presidential Regulation No. 28 of 2016 concerning Health Insurance.⁽⁸⁾

In essence, social security in the health sector, began to be developed. Countries in the world through

international health agencies WHO has agreed to achieve Universal Health Coverage (UHC) in 2014. UHC is a health system that ensures every citizen in the population has fair access to services quality promotive, preventive, curative and rehabilitative health at an affordable cost that includes two core elements in it namely access to fair and quality health services for every citizen, and protection of financial risks when citizens use health services where the Indonesian state is currently located in the transition to coverage of universal health services.⁽⁹⁾ With this system, public health can be achieved.

In Indonesia the understanding and capability of the regions in managing Jamkesda are still different from one another, especially in the framework of achieving Universal Health Coverage, as evidenced by only 4 provinces that have achieved Universal Health Coverage (UHC). The number of provinces that only guarantee non-Jamkesmas poor participants reached 27 provinces (81.81%), and 2 provinces (6.06%) using SKTM (Certificate of Disability).⁽¹⁰⁾

In order to provide health protection to the community through the Indonesia Health Card-Health Insurance Program (JKN-KIS), the role of the Regional Government is expected to be present in efforts to improve the quality of the JKN-KIS program in accordance with the mandate of Law Number 40 of 2004 concerning the National Social Security System. At present the Regional Government integrating the regional health insurance program (Jamkesda) into the JKN-KIS Program has increased and it is hoped that all Regional Governments can do the same, in addition to many other things that can be done by the Regional Government in supporting the implementation of the JKN-KIS Program continuous. "BPJS Health together with local and regional governments and other stakeholders can work together to achieve 100% participation or targeted universal coverage to be realized on January 1, 2019. At present the coverage of JKN-KIS participants in Indonesia has reached 170.9 million or around 70%. The local government can optimize the Jamkesda budget and be integrated with the JKN-KIS Program. The legal basis or Jamkesda integration policy (population registered by the Regional Government) is clear, in accordance with, Presidential Regulation No. 12 Number 111 of 2013, Presidential Regulation Number 74 of 2014 concerning Guidelines for the Preparation of a Social Security and Employment Sector Road Map, Perpres Number 19 Year 2016 jo. Perpres 28 of 2016 concerning Health Insurance, Letter of the Minister of

Home Affairs number 440/3890 / SJ dated October 19, 2016.

The number of Jamkesda integration participants as of November 2016 is 15,151,350 people. Of the 34 provinces 32 provinces have integrated part or all of the District / City Jamkesda in their regions. There are 15 provinces that contribute through sharing of contributions / participants in Jamkesda integration financing with varying patterns, for example 40% of contributions are paid by the provincial government, 60% by Pemkab / Pemkot. The 15 provinces are Aceh, North Sumatra, Riau, West Sumatra, Bengkulu, Bangka Belitung, Jakarta, Banten, Central Java, West Java, Central Kalimantan, NTB, West Sulawesi, Gorontalo, South Sulawesi. Referring to BPJS Health data, 378 Jamkesda districts / cities have been integrated into the JKN-KIS program. Then, there are 4 provinces which can be categorized as Universal Health Coverage (UHC) or JKN-KIS membership of the population > 95%, namely DKI Jakarta Province, Aceh Province, West Papua Province, Gorontalo Province.⁽¹¹⁾ A good management system for social security institutions in the form of BPJS Health is as an effort to provide protection to the community in the health sector.

Conclusion

The social security system established is to provide social protection to the community. Law No. 40 of 2004 concerning SJSN is the issuance of Law of the Republic of Indonesia No. 24 of 2011 concerning the Social Security Organizing Agency (BPJS). The law explains BPJS consists of BPJS Health and BPJS Employment. BPJS Health is a government policy program to organize National Health Insurance. Being an effort to create a social security system in the health sector, synergy efforts are needed, therefore concurrent affairs in the health sector can be carried out jointly between the government and the regional government and the Health Social Security institutions formed based on legislation. In this case, there are certainly many elements that must be addressed, so that in order to realize effective and efficient improvements, it may be necessary to take action steps based on scientifically determined priority sequences, for example based on difficulty and usefulness.⁽¹²⁾

Abstract

Background: The weight of Schoolbag in childrens school is an important issue within education and general health . Schoolbag overweight can cause back pain in children, which may lead to chronic back problems in adulthood.

The aim of this study is to evaluate the relation between the weight of school bag and backache among primary school pupils in Tikrit city.

Subject and method: A cross sectional study is conducted in Tikrit primary schools from the first of November 2018 to the end of March 2019 among primary school pupils .

Sample size included 252 pupils, 130 were females and 122 were males. Two school chosen by cluster sampling , the pupils were chosen by stratified then simple random sampling methods ,the data collected by using a questionnaire which was administered by the interviewers the students were examined to exclude any present congenital anomalies.

Results: From the total sample of 252 pupils 74 (29.4%) pupils report backache from those 43 (58%) were females and 31 (42%) were males . The sequence of the location of back pain was upper as (59.4%) backache then middle (33.6%) and very few pupils have lower backache (7%) . The relation between bag weight/pupil weight percentage and positive backache in primary school pupils from the total 74 pupils suffering from backache 41 (55.4%) has the percentage of bag weight / pupil weight more than 15% , 26 (35.1%) pupils had it between 10%-15% and only 7 pupils (9.5%) had it below 10%.The back pain is most commonly reported among those who come walking to the school.

Conclusion :The study concluded that 74 (29.4%) of primary school pupils complained from backache among those 43 (58%) were females and 31 (42%) were males.

Key Words: Kilogram (Kg), Tikrit University College Of Medicine (TUCOM), Back ache, primary school pupils.

Introduction

School is one of the important institutions , when it provides healthy environment it gives children's the capability to grow and flourish . The bag is the most common way used to take books , equipments and other things students need at school ,which stays with the

student along their study^[1] . .

The usage of computer based learning and online learning by dissemination the learning material to the students are policies used by countries to reduce the usage of bags to reduce its harmful effect on school children's^[2]. On the contrary, in Iraq, the risk factors for back pain caused by heavy school bags are increasing rather than decreasing , due to lack of studies on this important issue^[2].

The National Institute of Occupational Safety and Health reports shows that there are different limits of bag weight between countries . The mean carrying weight for children's in schools below the age of 16 years old are 14kg for boys and 8 kg for girls^[2] . Health centers all over the world agreed that children should not carry bags not more than 10%-15% of their total body weight^[3]. The American Occupational Therapy recommends a limit of 15% of body weight^[3] . National Back Pain Association makes a guidelines which recommend that schoolbags must be under the weight of 10% of children body weight^[4] .

In a recent study, prevalence of musculoskeletal disorders was 63.4% of students of mean age 10.6, the schoolbag affects the shoulders (27.3%) than on the back (15%) and the time was an important factor that affect the symptoms^[5] . Students that carry heavy loads (bags) well develop pain in shoulders and neck which might cause musculoskeletal symptoms in early age^[6] .

An important factor the student learn how to carry his bag to avoid and decrease the postural problems, backache and musculoskeletal diseases. Carrying a load a backpack position can cause less problems than carrying in a lateral position^[7] .

When Carrying the school bag on the shoulders rather on the back this well increase heart rate and oxygen consumption ,so carrying the bag on the back is accepted method due to usage of large muscle groups rather than small muscle groups in order to reduce muscle fatigue and pain^[8]. In Indian schools a study shows that children's between the age 10-15 years to maintain good body posture^[9, 10, 11].

Subjects and Method

Study population and sampling

Sample: two primary schools was chosen by cluster sampling , the pupils were chosen by stratified then simple random sampling methods and this study included 252 pupils, 130 were females and 122 were males all student were examined for presence of back congenital anomalies.

Presentation and data analysis:

All data management and analyses was done by manual statistical methods schoolbag weight/body weight percentage was calculated by the equation:

Statistical test (chi square) applied to test the significance of the results , chi square test achieved by manual calculation.

Results

The current study shows reported backache and its location in different stages in both male and females from the total sample of 252 pupils most of pupils do not report any backache 178 (70.6%) and only 74 (29.3%) pupils report backache from those 43 (58%) were females and 31 (42%) were males as in figure (1).

From the total sample of 252 pupils in 74 (29.4%) pupils report backache from those 43 (58%) were females among those females 36 (83.7%) had upper backache , 6 (14%) had middle backache and only 1 (2.3%) had lower backache .While in males 31 (42%) had backache among those 8 (25.8%) had upper backache , 19 (61.2%) had middle backache and 4 (13 %) had lower backache.

From the total of 130 females 87 (67%) have no backache and 43 (33%) report backache. While in males from the total 122 pupils 91 (74.5%) have no backache and 31 (25.5%) had backache .

An interesting finding that in those who have backache the sequence of the location was upper as (59.4%) backache then middle (33.6%) and very few pupils have lower backache (7%). Figure (1) show no significant association between backache and gender in primary school pupils at p-value less than 0.05.

Figure (1) : Reported backache in primary school pupils

Figure (2) shows the bag weight/ pupil weight percentage which was 7 (5.3 %) female pupils have it below 10 % , 43 (33%) female pupils have the percentage between 10 -15% and 80 (61.7%) were more than 15% . While in male 14 (11.4%) pupils has it below 10 % , 46 (37.8%) between 10% - 15% and 62 (50.8%) above 15% . There is no significant association between gender and bag weight/ pupil weight percentage in primary school pupils at p-value less than 0.05.

Figure (2) : percentage of bag weight / pupil weight in primary school pupils

Table (1) demonstrate the relation between the bag weight/pupil weight percentage and positive backache in primary school pupils from the total 74 pupils suffering from backache 41 (55.4%) has the percentage of bag weight / pupil weight more than 15% , 26 (35.1%) of pupils had it between 10%-15% and only 7 pupils (9.5%) had it below 10%

As we can notice in the table (1) that there is no pupil in first and second grades has the percentage below 10% that mainly due to their low body weight in relation to their heavy bags .There is no significant association between bag weight/ pupil weight percentage and positive backache in primary school pupils at p-value less than 0.05.

Table (1) The relation between the bag weight/ pupil weight percentage and positive backache in primary school pupils

Percentage Grade	Less than 10%	10% -15%	More than 15%	Total Number of pupils with +ve backache
First grade	0	5 (50%)	5 (50%)	10 (13.5%)
Second grade	0	3 (25%)	9 (75%)	12 (16.2%)
Third grade	2 (9.5%)	8 (38%)	11 (52.5%)	21 (28.4%)
Fourth grade	1 (10%)	2 (20%)	7 (70%)	10 (13.5%)
Fifth grade	1 (8.3%)	3 (25%)	8 (66.7%)	12 (16.2%)
Sixth grade	3 (33.3%)	5 (55.5%)	1 (11.2%)	9 (12.2%)
Total	7 (9.5%)	26 (35.1%)	41 (55.4%)	74 (100%)
Chi square = 15.39 P-value = 0.01 Degree of freedom= 10 Correlation = 0.41 Not significant association				

Table (2) show the relation between the bag weight/ pupil weight percentage and negative backache in primary school pupils from the total 178 pupils who has no backache 101 (56.7%) has percentage of bag weight / pupil weight more than 15% , 63 (35.3%) of pupils had it between 10% - 15% and only 14 pupils (8%) had it below 10 % .

As we can notice in table (2) in the first 4 classes the highest number of pupil has the percentage above 15% while in the last two classes the higher number were between 10% - 15% . There is very strong association between bag weight/ pupil weight percentage and negative backache in primary school pupilsat p-value less than 0.05.

Table (2) The relation between the bag weight/ pupil weight percentage and negative backache in primary school pupils

Percentage Grade	Less than 10%	10% -15%	More than 15%	Total number of pupils with -ve backache
First grade	0	6 (16.2%)	31 (83.8%)	37 (20.7%)
Second grade	1 (3.2%)	7 (21.8%)	24 (75%)	32 (18%)
Third grade	2 (13.3%)	4 (26.7%)	9 (60%)	15 (8.5%)
Fourth grade	4 (11.7%)	13 (38.3%)	17 (50%)	34 (19%)
Fifth grade	3 (10.3%)	17 (58.7%)	9 (31%)	29 (16.4%)
Sixth grade	4 (13%)	16 (51.6%)	11 (35.4%)	31 (17.4%)
Total	14 (8%)	63 (35.3%)	101 (56.7%)	178 (100%)
Chi square = 31.69 P-value = 0.001 Degree of freedom= 10 Correlation = 0.38, Very strong association				

Considering the way of transport regarding pupils with positive backache explain in figure (3) as the following : approximately the number of pupils going by vehicle is the same as for those who walk in the third and fourth grades while in the first and sixth grades the number of pupils who walk is less than those using vehicles and opposite to this is in the second and fifth grades. There is no significant association between stage and way of transport among pupils with positive backache p-value less than 0.05.

Figure (3) :Way of transport in primary school pupils with positive backache

In the current study , comparing positive with negative backache regarding examination results the study shows that most of the pupils who had an abnormal examination result had a backache .

Discussion

The weight of schoolbag in schools is an important issue within the educational and health sector. Chronic backache in adults may be caused by excessive schoolbag weight in childhood. This study is the first of its kind in Iraq to evaluate this situation and encourage the population to pay more attention for this problem.

A number of 74 (29.3%) of students suffer from the backache among the total of 252 students in comparison to a study in King Faisal University, Saudi Arabia in which it was 1170 (42%) student suffer from the backache among the total of 2567 students this study has a higher pupil number than our study ^[12] .

This study shows that third grade shows the highest percentage of backache 21 (58%) while in university Tenaga National (UNITEN) ,Malaysia fifth grade show

the highest percentage as 285 (87%) due to different daily schedule in each grade and each day of the week ^[13].

The majority of pupils are using the double strap bag whether they have positive(91.8%) or negative (94.3%) backache this corresponds with a study in Brazil which shows that the most popular style of schoolbag was found to be a backpack-style bag with two straps (95%) ^[14].

In this study pupils show abnormal examination result in the following percentages in positive backache (20.3%) , in negative backache (4%)while a study in university of Novi Pazar, Serbia show relatively high frequency of postural deformities ^[15] .

Conclusion

The study is concluded the followings:

1. The majority of pupils do not report any backache 178 (70.6%) and only 74 (29.4%) report backache.
2. Among pupils with positive backache (58%) were females and (42%) were males.
3. The location of backache in primary school mostly reported as upper back pain (83.7%) in females and as middle back pain (61.2%) in males
4. The percentage of bag weight/ pupil weight percentage in (61.7%) of females and (50.8%) males were above 15% .
5. The majority of pupils are using the double strap bag whether they have positive or negative backache.
6. Examination result in student with positive backache shows that (79.7 %) of pupils were normal and (20.3 %) of them were abnormal .

Abstract

Several studies have indicated that H. pylori treatment causes an impact on the status or absorption of B12 vitamin. When talking about malabsorption of B12 vitamin, H. pylori is a big risk, especially for adults and older people who have suffered bacteria related diseases for a long time. A literature review of more than 25 papers have found inconclusive results due to the methodological differences in them. This paper assesses the relationship among the deficiency of vitamin B12 and H. pylori.

This study involved hundred patients in total, having deficient B12 serum vitamin. The study conducted Upper G I Endoscopy and obtained gastric biopsies for histological evidence and histopathological examination of H. pylori infection.

The results of the tissue biopsy pointed out chronic antral gastritis in thirty patients and chronic atrophic gastritis in sixty-two patients. It was found that the H. pylori infection by histology is positive in eight-six patients. A significant relation was found among H. pylori and atrophic gastritis and also between B12 deficiency and H. pylori. This study concluded that, the deficiency of B12 Vitamin is predominant in the Helicobacter pylori infection.

Key words: *Helicobacter pylori; pernicious anemia; Vitamin B12*

Introduction

The relation of H. pylori infection is significant with a lot of micronutrient deficiencies. H. pylori and the deficient B12 vitamin have a significant positive relation with each other. Researchers have found that the presence of H. pylori bacteria in many patients having pernicious anemia because of not well treated B12 vitamin deficiency, even in people without any digestive problem or gastritis.⁽¹⁾

H. pylori infection and chronic gastritis of the antrum of the abdominal have a strong relation between them. This causes impairment in the secretion of pepsin and gastric acid and is therefore related to malabsorption of B12 vitamin. The infection H. pylori is the source of B12 vitamin deficiency. It is also called as the supporter of gastritis ulcers and has the capacity to stop the stomach from absorbing B12 vitamin and thus leads to its deficiency.⁽²⁾

Pernicious anemia can characterise the ending stage of a procedure that starts with H. pylori linked gastritis and origins from progressive atrophy levels till the complete loss of parietal cell mass occurs. Many pieces of research have indicated that the B12 vitamin deficiency and H. pylori have a strong relation. This relation exists even in patients without any gastrointestinal issues or gastritis. H. pylori bacteria have been found in more than 50 percent of patients having pernicious anemia, specifically due to not well-treated deficiency of B12 vitamin.⁽³⁾

Method

This study involved 100 patients in total who had the level of B12 vitamin lower than 200 pg/ml. All of the patients had the age of 19 years or more than that. The patients having hepatic or renal failure, postgastrectomy status, patients who had received prior H. pylori eradication therapy and pregnant ladies were omitted from this experiment. The study also did not include immunocompromised states, for example,

diabetes mellitus and HIV infection because of more than one factors involved in these diseases. Peripheral smear was conducted for all of the involved patients. (4)

The gastrointestinal endoscopy was experimented in all of the patients to get biopsy specimens from the gastric antrum, fundus and body and to study the microscopic appearances of the gastric mucosa. The samples were gathered using individual sterile forceps. The samples of biopsy were forwarded for histopathology investigation and further processing, involving staining for H. pylori infection. (5)

Statistical analysis

The data of the experiment was analyzed using SPSS software. This helped to calculate the percentage of B12 vitamin deficiency and frequency in the patients of Helicobacter pylori infection. The standard deviation and the mean value were also calculated. To find out the statistical difference among the patients, the Chi-square method was applied. The value of p was taken as 0.05.

Results

In total, 100 patients were gathered having a B12 vitamin deficiency. From them, 65 were men and 35 were women, having the average age of 43.75± 19.44 yrs. 86 patients had positive results of Helicobacter pylori infection (Table 1). In the histopathology assessment, 62 percent of patients were found to have chronic atrophic gastritis. Normal Histology was found in approximately 3 percent of patients (Table 2). The distribution of B12

vitamin in connection with H. pylori revealed that there is a considerable correlation among H. pylori status and B12 value. Table 3 indicates that 31 patients infected by H. pylori had normal B12 vitamin level, while 55 patients had deficient B12 vitamin level. The patients were infected by H. pylori with a considerable difference (P value less than 0.05).

Table 1: H. Pylori status among patients.

H. pylori infection	Frequency	Percent
Negative	14	14%
Positive	86	86%
Total	100	100.0%

Table 2: Distribution of biopsy findings among patients.

Endoscopic findings	Frequency	Percent
Chronic antral gastritis	30	30%
Chronic atrophic gastritis	62	62%
Peptic ulcer	5	5%
Normal	3	3%
Total	100	100.0%

Table 3: The deficiency of Vitamin B₁₂ in H. pylori infected patients

Normal Deficiency			Vitamin B ₁₂		Total
H. pylori	Negative	Count	11	3	14
		%	78.6%	21.4%	100.0%
	Positive	Count	31	55	86
		%	36.0%	64.0%	100.0%
Total		Count	42	58	100
		%	42.0%	58.0%	100.0%

P value < 0.05

Discussion

This is a standard experiment for treating the lack of B12Vitamin, therefore it is vital to create the cause for B12vitamin shortage as it can be linked with disorders of ilium causing reduced absorption, inadequate dietary intake, intrinsic factor from practical cells, and disorders linked with gastric pepsin secretion. Helicobacter pylori has been found as an etiological factor in the shortage of B12Vitamin ^(1, 2). The clinical importance of this aspect is not very clear ⁽³⁾. It is also not clear if the calcium supplements have the capacity to reverse B12 vitamin malabsorption. The previous reports are not supported which indicates that megadoses of Vitamin C destroy B12 vitamin ⁽⁴⁾.

Nitrous oxide is an anesthetic component and it inactivates and oxidizes vitamin B12. That is the reason that both of the enzymes on which vitamin B12 is dependent become inhibited and able to create several characteristics. Over the counter or OTC availability is the reason for enhanced Omeprazole utilization and that is the reason that it is used without the recommendation of healthcare professionals. Although the drug is beneficial for GERD and PUD, its usage is full of risks with complications. This involves B12 vitamin deficiency complications, for example, macrocytic anemia, hyperhomocysteinemia and/or neuropathies, drug-drug interactions and enhanced aspiration pneumonia risk for some patients ⁽⁵⁾. Before the arrival of mouth ingested free B12 vitamin in the duodenum 2ndsection in small intestine, it stays in the bound state in addition with and R-binder⁽⁵⁾

Conclusion

This study concluded that Helicobacter pylori is an etiologic aspect of the deficiency of B12 vitamin. Therefore, this condition is predominantly found in Helicobacter pylori infected patients

Detection of Parvovirus B19 Infection in Thalasemic Patients in Tikrit City, Serological Study

Hala Mohamed Majeed

Department of Microbiology, College of Veterinary Medicine, Tikrit University, Tikrit, Iraq.

Abstract

Background:-Parvovirus B19, a member of the genus Erythrovirus virus of the Parvoviridae family, causes several clinical diseases including infectious erythematosis, joints, fetalis hydrops or chronic hemolytic anemia like thalassemia syndrome, transient aplastic crises. B19 can be transmitted through respiratory secretions, blood products, and blood transfusions.

Objective: To identify the seroprevalence of Human Parvovirus B19 virus in Patients with thalassemia major in Tikrit city.

Material and method:- This lessons is a cross-sectional case control study that included 130 Patients infection with beta thalassemia attendance the Tikrit Military Hospital Department of Blood Diseases Unit as of 1/7 /2018 to 1/12/2018 major age ranging from 1-60 years and 50 healthy patients as control grouping. Blood sample were obtain for determination of specific antibodies IgG and IgM for HPV-B19 by enzyme linked immunoassay (ELISA).

Results:- HPV B19 IgM antibodies were detected in 15 of 130 thalassemic patient(11.5%),and not detected in any patient of control group, P value (0.02).While anti-HPV B19 IgG antibodies were detected in 50 of 130 of thalassemic patient (38.5 %)and 2(4%) of 50 in control group(5%), P value(0.003).. the range age of the thalassemia patient was (2 –58 years) and B19 infection was highest in the 20-to-40 year range. And the result show the highest percentage to infected to virus during the blood transfusions once a month per month was 30(100%) anti-B19IgG and 8(26.7%) anti-B19IgM.

Conclusion:-In this study, acute B19 infections were detect in patients with beta thalassemia major. showing of such high-risk groups can significantly reduce the incidence and prevalence of B19 infection; thus, screening is required for epidemiologic surveillance and disease-prevention measures.

Keyword: *Detection, Parvovirus B19, Infection, Thalasemic, Patients, Tikrit, serological, study.*

Background

Human Parvovirus B19(HPV B19)is a small, naked virus belonging to the family Paravaviridae¹. Parvovirus B19 (Latin means small) is a newly emerging DNA virus discovery in Austarlain, When the giver sera tested for HBV, but found the B19 virus in the sera, 19 in row 19B (bank donation number) and labeled B19, later the B19 virus was implanted in the Erthrovirus genus of the Parvovirade family².

Infection with this virus is very frequent and can lead to a broad range of scientific lesions depended on the immunity and hematological state of the patients, in immunologically qualified individuals, B19 infection can be symptomatic or benign and may cause Erythema infection (V disease), and arthritis³. However, in patients reduced production or increased loss of erythrocytes, such as syndrome Thalassemia and other chronic hemolytic anemia, B19 infection lead to lower drops of hemoglobin level and anemia that can threaten life⁴.

Corresponding author:
Assist. Prof Hala Mohamed Majeed
m.hala17@yahoo.com

Parvovirus B19 is common throughout the world, and 15% of children aged 15 years have IgG positive

and is spread in late coldness and early spring. The virus is transmit through contact to drops or infected blood that is minimum and vertically from mother to fetus cause Congenital anemia and fetalis hydrosis.⁵

The Infection incubation period is 4-14 days but can be up to 21 days, but viremia can persist for up to a week, after which the IgM Abs suddenly rises to the peak and at 21 days, IgG Abs virus then rises and remains high.⁵

Major thalassemia patients with beta-thalassemia, due to chronic hemolytic disease, have an excessive blood transfusion system and are thus at elevated risk of obtaining B19 transmission, but contain rarely been study by detect Abs to B19.^{6,7} A rapid decline of anemia, reticulocytopenia, and cessation of erythropoiesis in the bone marrow describe the transient aplastic crisis. It is probable that the non-induced crisis that occurs in B19 is often diagnosed as complicating the underlying disease.⁸

In addition, these patient are at elevated risk for transfusion-borne disease. Similarly, the B19 infection was also report from multiple hemorrhagic transfusions patients, recipient of Factor VIII concentrate, and children with congenital malformation.^{9,10} In addition, the B19 transmission problem is compounded by repeated contamination of the coagulation centers. B19 transmission leads to non-spitting of red cells, neutrophils, and thrombocytopenia.¹¹

HPV B19 had a strong predominance of the hematopoietic stem cell¹². The virus is integrated into a specific location in the human genome. The infected cell fails to divide, weakening the production of new red blood cells, and the retic number is often reduced to less than 0.1 to 0.5% of the 6-20% routine values in the patient with hemolytic anemia. HPV B19 infects mature erythroid progenitor (CFU.E), preventing further reproduction and maturity, and the most primitive precursors (BFU.E) are affected as a minimum¹³.

Objective

To identify the seroprevalence of Human Parvovirus B19 virus in Patients with thalassemia major in Tikrit city

Material and Method

This study is a cross-sectional case control study that included 130 Patients infection with beta thalassemia attending the Tikrit Military Hospital Department of Blood Diseases Unit from 1/7 /2018 to 1/12/2018 major age ranging from 1-60 years and 50 healthy patients as control group. Demographics Obtained from the patient group such as age, gender, duration of disease, Numbers of blood transfusion units, Serological status of HBs Ag , H CV, HIV. Anti-HPV B19 IgM and Anti- HPV B19 IgG has also been obtained by Using the ELISA test

kits.(DRG International, Inc. United States, Catalog Number EIA-3504 IgM ELISA and Catalog Number EIA-3503 directed IgG). the control set included 50 non Thalassemia occurs at the same hospital for a different reason with a negative history of transfusions. Anti-HPV B19 IgM and Anti-HPVB19 IgG were also done. IgM refers to a recent infection while IgG refers to the previous infection.

Data Analysis

Implemented using the SAPPs program Version 14.0. Chi-Square and Fisher's exact test were used to determine the statistical significance of the differences between the patient control group (case) according to Anti-HPVB19 IgM and IgG. The value of P <0.05 was considered to significant .

Results

In this study, we found only 15 Out of 130 patients have positive thalassemia Anti-HPVB19 IgM (11.5%), while no any positive case of anti-HPVB19 IgM was detected in the control group with the value of P (0.02). We also found 50 patients Out of 130 in the thalassemia patient positive for anti-HPVB19 IgG (30.4%), while only 2 out of 50 patients in control group it is positive to anti-HPVB19 IgG (4%) with P value (0.003) As shown in Table (1)

Table (1) Distribution of serological markers from IgG Abs HPVB19 and IgG in Thalassim patients and Control Group

Patients group	No of sample	Ab HPVB19 IgM	Ab HPVB19 IgG
thalassemic group(130)	130(72.2%)	15(11.5%)	50(38.5)
Control groups (50)	50(27.8)	(0) (0)	2(4%)
Total	180(100)	15	52
P value	-	0.02	0.003

Also we found only 1 cases in thalassemic group (6.7%) were positive for Anti-HPVB19 IgM had number of blood transfusion once every two month, 30 cases (60%) had number of blood transfusion once mouth were positive for Anti-HPVB19 IgG and 8 cases (53.3%) were positive Anti-HPVB19 IgM. while cases number blood transfusion two times per mouth were 15(30%) positive for Anti-HPVB19 IgG and 5 cases(33.3%) were positive Anti-HPVB19 IgM and we found 5 cases (10%) were positive for Anti-HPVB19 IgG had number of blood transfusion Three times per mouth and 1 cases (6.67%) were positive Anti-HPVB19 IgM as shown in table (2).

Table (2) Anti-B19 Abs and total number of transfusion received by thalassaemia

Number of transfusion	Positive % Anti-B19 IgG	Positive % Anti-B19 IgM
Once every two monthly	0 (0)	1(6.7%)
Once a month	30(60%)	8(53.3%)
Two times per month	15(30%)	5(33.3%)
Three times per month	5(10%)	1(6.7%)

Total 65 thalassaemia major patients test by in-house ELISA, anti-B19 IgM antibodies were detect in 15(23%) thalassaemia patients and 50 (77%) test seropositive for anti-B19 IgG antibodies. According to gender, 66.7% (10 of 15) males and 33.3% (5 of 15) females were positive for anti-B19 IgM antibodies, while 80% (40 of 50) males and 20% (10 of 50) female tested positive for anti-B19 IgG. The frequency of IgG antibodies was 75, 87.5, 72.2, 71.4 and 50 % in males and 100, 75, 100, 66.7 and 100% in females of age groups 1 –20, 20–30, 30–40, 40-50 and 50 – 60 yrs, respectively. The anti-B19 IgM antibody positivity were 25, 18.8, 16.7, 14.3 and 25% in males and 50, 25, 50, 33.3 and 100% in female in the age group shown in table (3).

Table(3) frequency of anti-B19 Abs in thalassaemia major patients according to age and gender

Age group in years	Sex			Positive % anti-B19 IgG			Positive % anti-B19 IgM		
	Total	Male	female	Male	female	Total	Male	female	Total
1-20	10	8	2	6(75)	2(100)	8	2(25)	1(50)	3
20-30	20	16	4	14(87.5)	3(75)	17	3(18.8)	1(25)	4
30-40	20	18	2	13(72.2)	2(100)	15	3(16.7)	1(50)	4
40-50	10	7	3	5(71.4)	2(66.7)	7	1(14.3)	1(33.3)	2
50-60	5	4	1	2(50)	1(100)	3	1(25)	1(100)	2
Total	65	53	12	40	10	50	10	5	15

Discussion

Parvo virus B19 infection is distributed in humans throughout the world. Epidemiological studies of several countries show that the frequency of HPV B19 infection vary among many country and populations and increases with age ¹⁴. Unfortunately, we do not have data on the exact prevalence of HPV B19 infection in our country.

In this study, a higher prevalence of HPV B19 specific IgM indicative of recent infection (11.5%) was found in thalassemic group compared to control (zero) with significant statistical difference (P value 0.02). The prevalence of HPV B19 specific IgG (38.5 %) in thalassemic group compared to control group(4%) with significant statistical difference (P value 0.003), and this is similar to results obtained by Adnan ,2013 ¹⁵.from Babylon, of 60 thalassemic major patient (Anti-B19 IgG is 38.4% and IgM 13%). Siritant korn *et al* ; ¹⁶ in Thailand , of 60 thalassemic major patient (Anti-B19 IgG is 38% and IgM 4%) . In Kishore *et al* . in serological study on 90 indian patient with thalassemia reported much higher rate of Anti-HPV B19 IgM and IgG (41.1% and 81% respectively) ¹⁷. The difference perhaps associated to geographical difference in prevalence of HPV B19 infection ¹⁴.

Conclusion

In this study, acute B19 infections were detect in patients with beta thalassemia major. showing of such high-risk groups can significantly reduce the incidence and prevalence of B19 infection; thus, screening is required for epidemiologic surveillance and disease-prevention measures.

Evaluation of Titanium di oxide Nano-fillers Incorporation on Mechanical Properties of Heat Cured Acrylic Resin

Hasanen A.Alnamel¹, Ali ShyaaThedan²

¹Assistant Lecturer, Prosthetic Dentistry, College of Dentistry, University of Basrah, Basrah, Iraq.

²Assistant Lecturer, Orthodontic Dentistry, College of Dentistry, University of Basrah, Basrah, Iraq.

Abstract

The persistence of this revision was to assess the outcome of adding of surface cured titanium dioxide Nano stuffing (TiO₂) on Impact strength, Transvers strength and tensile strength. Titanium oxide Nano fillers were merged into (PMMA) denture base by allowed essential majority. The nanoparticles were coated by a film of trimethoxysilypropylmethacrylate (TMSPM). A controlled group and three different percentages 3%, 5% and 7%, of TiO₂ dust was added to PMMA powder by weigh up and mixed by probe sonication appliance. 120 samples were built and distributed into 3 clusters rendering to the test (40 specimens for each group) and each cluster was split into 4 sub-groups conferring to the ratio of auxiliary TiO₂ (10 specimens for each subgroup). The tests piloted were impact strength (charpy tester), transverse strength test and tensile strength test. Extremely significant rise in charpy tester and transverse strength was detected associated with the increase of the addition of TiO₂ powder to (PMMA) at the ratio of 3% and 5%; despite the fact a significant drop happened in both tests at the ratio of 7%. Alternatively, there were non-significant progresses in the tensile strength through the enforcement of (TiO₂).

Conclusion: the result of this revision presented that treated TiO₂ Nano-fillers is nominal in altering impact strength and Transvers strength while it was non nominal in successful altering the tensile strength, the extreme rise in impact strength and Transvers strength pragmatic in denture base containing 5% wt. of treated TiO₂ Nano-particles.

Keywords: heat cures acrylic, Titanium dioxide Nano-filler (TiO₂), Nano technology.

Introduction

Till now a day acrylic still used widely whatever the poor mechanical properties of it because it considered as material of choice for denture base [1]. To solve this problem acrylic might be treated by different enforced materials in order to enhance its properties these enforcement materials include metallic strengtheners, carbon-graphite fiber, aramid fiber and glass fibers [2].

One of the best materials used to altering the properties of acrylic is the use of Nano particles through the Nano technology [3]. In the chemical engineering, during the past 10 years, study has been enthusiastic to the advance of a new manufacturing procedure that includes nanoparticles into acrylic resin given that a new class of acrylic resin that proposals the strength of the Nano-oxides, with the elasticity of PMMA [4].

Metal Nano oxide as TiO₂, and SiO₂ are branded by their minor extent, great surface area and strong interfacial contact with the polymer matrix [5]. So that, they can advance the physical, thermal and optical properties of the polymer matrix denture base [6].

Augmented bond strength by operation of silanes is a consequence of a multipart set of issues such as wet out, surface energy, border layer captivation, polar adsorption, acid-base communication, interpenetrating grid development and covalent response [7]. Titanium oxide Nano-particles mechanically underline the polymers and allow for high impact strength, breakage toughness, rigidity and solidity of the armored PMMA matrix [8].

External surface alteration of a mineral particle with an organic substance is a valuable method to decrease its superficial energy and raise its compatibility with

polymer matrix and dispersalsameness and thus recover the assets of the polymer-inorganic subdivisions [9].

The non-competitive Nanoparticles were experiencedsuperficialconduct with saline link agent and entrenched into PMMA [10].

Handling the superficial aspect ofTiO2 nanoparticles using trimethoxysilypropyl methacrylate (TMSPM) could reducecombination of TiO2 particles and improve its compatibility with organic polymer [11].

Materials and Method

Titanium dioxide already coated with trimethoxysilypropylmethacrylate (TMSPM), heat cured resin polymer and monomer, yellow dental stone (III) and could mold seal were prepared to be used. (120) samples were organized for this revision. The samples were distributed to three groups according to the type of the examination. Each group involved 40 samples and these were segmented according to the attentiveness of Titanium di oxide Nano particles into four sub groups as follow:

- a. Group (A) control group (0% TiO2) 30 samples
- b. Group (B) 3% modified group (3% weight TiO2) 30 samples
- c. Group (C) 5%modified group of (5% TiO2) 30 samples
- d. Group (D) 7% modified group of (7% TiO2). samples

Table (1): Involvement Proportion of TiO₂ with PMMA according to the manufacturer instruction

cod	TiO ₂	Polymer	monomer
0%	0	100g	40ml
3%	3g	97g	40ml
5%	5g	95g	40ml
7%	7g	93g	40ml

Plastic model preparation:

By using of CNC laser cutting machine plastic models were made on deferent plastic sheet: .a. for Compressive or Transverse strength test bar designedsample with

measurement of (65mm x 10 mm x 2.5 ± 0.1 mm) length, width, thickness respectively.

b. for charpy or Impact strength test: bar designedsample with measurement of (80 mm x10 mm x 4 mm) length, width and thickness respectively.

c. Tensile strength test: Dumbbell- Shaped samples with measurement of (75mm × 12.75mm × 2.5mm) length, width, thickness respectively. As shown in Fig (1)

Fig (1) Tensile strength specimen (A), Transverse strength specimen (B) and Impact strength specimen(C)

Preparation of the mold

By using metal dental flask, denture processing method were used to prepared the samples, at the beginning paint the flask by separating medium allowed to dry then paint the samples by separating medium weight to be dry mix the stone according to manufacturer instruction then filed the first half of the flask by the stone put the samples in which half of it appeared to be removed easily after the set of the stone put the other half of the flask on the first one fill the flask by dental stoneweighted to the dry and open the tow half of the flask paint them by separating medium and pack the acrylic and cure

Titanium di oxide Nano fillers incorporation

TiO₂ Nano filler powder was added by weightiness in four clutches; 0%, 3%, 5%, and 7% to acrylic monomer. digital automaticweighing scale with exactness of (0.001g) was used, Next the totaling mixed by probe ultra-sonicater (140W, 65KHz) for several min to destroy the coated particles intospecific crystals of Nano TiO₂.The postponement of monomer with TiO₂ Nano crystals was instantlydiverse with polymer to decrease the opportunity of crystals accumulation and segmentparting.

1. Charpy test (Impact strength test)

A- Test samples

The samples were equipped with measurement (8cm

x 1cm x 0.4 cm) for unnotched Charpy Impact test. For each concentration ten samples were equipped make an overall of (40) samples. PMMA samples were kept in distilled water at 37°C for 48 hours on the incubator before the test.

B-Testing equipment and procedure

The test was assessed subsequent the technique recommended by the use of Charpy device. The samples were sustained horizontally at each end and hit by free fluctuating pendulum of two Joules and digital paradigm to show the impact energy fig (5). The measurement analysis provides the impact energy in Joules. The amount of the strength at unnotched specimens was intended in kilo Joules per square meter (KJ/M²)

Fig (2) impact testing device

2. Transverse strength test

A- Specimen design:

The samples were equipped with measurements of (6.5cm x 1cm x 0.25cm) for each concentration. Ten samples were equipped make an overall of (40) samples. Samples were kept in distilled water at 37°C for 48 hours on the incubator before the test.

B-Testing equipment procedure:

The test was assessed subsequent the technique recommended by the use of universal Instron testing machine, the sample was situated on the bending fixture which consists of two parallel supports 5cm apart, the full scale was 50 Kg, and the weight was pragmatic with a cross head quickness of 1mm/min by a rod placed centrally between the supports making bend until break happens.

3. Tensile strength testing:

A- Specimen design:

The specimens used were dumbbell-shaped specimens with dimension of (75mm x 12.75mm x 2.5mm). Ten specimens for each concentration plus the control will make a total of (40) specimen for the measurement of transverse strength. All the specimens were immersed in distilled water on the incubator at 37°C for (48) hours before testing.

B-Testing procedure:

Tensile strength was assessed via Jian Qiao testing apparatus for determining tensile strength. (Fig7). The sample was detained at each two ends and the force at the disappointment was recorded in Newton (N) and the tensile strength standards were intended from the following equation:

$$TS = A/F$$

Where

TS: Tensile Strength.

F: The Force

A: Minimum cross-sectional area

Revision results

1. Impact strength

Statistical values listed in the table 2 appear the effect of adding different concentration of

TiO₂ Nano particles to heat cured acrylic on the impact strength of PMMA

Table (2) distractive data of Impact strength parameters analysis (Kj/m²)

	Group A	Group B	Group C	Group D	
N	10	10	10	10	
Mean	8.22	9.111	9.625	7.19	
SD	0.254	0.111	0.145	0.32	
SE	0.822	0.334	0.544	0.11	
range	Min.	8.133	9.001	9.321	7.222
	Max.	8.945	9.422	9.934	8.133

Maximum mean value seemed in group C with a mean of 9.617 Kj/m² and the last mean was in group D which was 7.77 Kj/m².

Rise of impact strength because of interfacial crop strength between Nano filler and matrix was high because of creation of cross-links or supra molecular attachments which shelter the Nano plaster and avoid crashes. Also the crash broadcast can be altered by good attachment

between Nano filler and matrix.

2. Transverse Strength

Statistical values listed in the table 3 appears the effect of adding different concentration of TiO₂Nano particles to heat cured acrylic on the transverse strength of PMMA

Table (3) descriptive data of Transverse strength parameters (N/mm²)

		Group A	Group B	Group C	Group D
N		10	10	10	10
Mean		114.945	120.135	124.533	111.633
SD		1.423	0.845	1.566	0.50
SE		0.834	0.367	0.587	0.111
range	Min.	112.433	118.992	121.996	110.994
	Max.	116.686	122.122	127.111	112.082

Maximum mean seemed in group C which was 124.562 compared to group D with mean of 111.6 which presented the last mean.

Rise in transverse strength that happen with adding of 3%TiO₂ Nano particles because of decent spreading of the greater than 150nm size of Nano subdivisions allow them to entomb between lining macromolecules chains. Segmental motion of the macromolecular chains were limited and prime to rise strength and firmness of the risen so this enhanced the fractural confrontation and lead to progress transverse strength.

3. Tensile strength test:

Statistical values listed in the table 4 appears the effect of adding different concentration of TiO₂Nano particles to heat cured acrylic on the tensile strength of PMMA

Table-4 Show that the same mean appeared in-group A, B, C and D, which was between 43.220 to 43.261

		Group A	Group B	Group C	Group D
No.		10	10	10	10
Mean		43.222	43.233	43.224	43.226

SE		0.533	0.555	0.555	0.555
range	min	39.77	39.24	39.53	39.89
	max	45.16	45.25	45.15	45.16

Discussion

The adding of coated TiO₂ Nano-filler powder to PMMA amplified the value of impact strength related to 0% concentration group, 5% group has the peak impact strength and 7% group has the last impact strength.

The increase of impact strength due to interfacial shear strength between Nano filler and matrix was high due to formation of cross-links or supra molecular bonding which cover the Nano filler and prevent sudden cracks. Also the crack propagation can be changed by good bonding between Nano filler and matrix [12].

Increase the concentration of smaller size Nano particles increase inter facial surface area so that the force need to destroy the samples also increased, adding TiO₂ Nano filler will form a network of 3D dimension of PMMA and TiO₂ Nano particles. PMMA, matrix powder chain shifted in to 3D-network like chains at 5% of Nano filler accordingly lead to decrease the segment motion and rise the impact strength [13].

At the 7%, the drop in impact strength as compared with 5% may be due to high external expanse of the collected Nano filler which may reach to micro filler TiO₂ within the matrix causing stress concentration around the collection of the Nano material which lead to fissure spread. The increase in transverse strength that occur with addition of 3% TiO₂ Nano particles due to good distribution of the <100nm size of Nano particles enable them to inter between liner macromolecules chains. Segmental motion of the macromolecular chains was restricted and lead to increase strength and rigidity of the risen so this improved the fractural resistance and lead to improve transverse strength [13&14].

Rise clarified on the roots of alteration strengthening when adequate stress progresses and fissure instigates to spread, an alteration of TiO₂ from the steady crystal phase to the steady monocyclic phase happens which reduces the energy of fissure spread, at this procedure growth of TiO₂ crystals happens and seats the fissure under a state of compressive stress and fissure spread was blocked [15].

At the 7%, drop in transverse strength may be because of spaces between the acrylic cuffs were occupied with Nano filler produced filler among this cuffs and because of frail attachments between them producing drop on transverse strength, as well as because it was stop stress transformation [16].

Conclusion

Within the limits of this study, the following conclusion was drawn:

1- Incorporating Nano titanium di oxide Nano filler into conventional heat-cured denture base resin results in an increase in impact strength and transverse strength. The magnitude of the increase is depending on the percentage of TiO₂ added into the resin (3%,5%). However, as the percentage increased to 7% there was significant decreased in impact and transverse strength.

2- No significant change in tensile strength was seen when acrylic resin was mixed with TiO₂ percentages 3% and 5% but there was highly significant decrease in tensile strength with 7% TiO₂.

The Effectiveness of *Garcinia Mangostana* L. Rind extract in Reducing Total Cholesterol Levels in Hypercholesterolemic Male White Mice

Hasyim As'ari, Asnani

Lecturer of Surabaya Health Ministry Polytechnic

Hypercholesterolemia contributes to the incidence of coronary heart disease which is the leading cause of death in the world ¹. Diet modification and hypolipidemic drugs, including herba, one of which is *Garcinia mangostana* L. will effectively reduce total cholesterol ³.

A research a posttest control group design ²⁰, type of research was a laboratory experimental research ¹⁵. The population was male white mice aged 3 - 4 weeks weighing 100-200 grams ¹². Hypercholesterolemia in male white rats was with MDLT induction (high - fat diet food) ⁷. Data collection of total cholesterol levels measurement used enzymatic spectrophotometer method, data analysis used Variant Analysis statistical test (ANOVA) with significance level $\alpha < 0.05$ ¹⁵.

The effect of *Garcinia mangostana* L. rind extract on total cholesterol reduction in white rats was grouped into a negative control group, positive control group and four dose treatment groups ⁴. Identification of hypercholesterolaemia in white rats was examined for total cholesterol on day 8 ¹⁶. The effect of *Garcinia Mangostana* L rind extract on reducing total cholesterol was examined on day 22 ^{3,16}.

The results of the examination showed the administration of *Garcinia mangostana* L. rind extract in all dosage groups effectively reduced total cholesterol levels with a significance level of $p < 0.05$.

Keywords : *Garcinia mangostana* L, total cholesterol and hypercholesterolemia

Introduction

In 2004 World Health Organization (WHO) stated that hypercholesterolemia had a contribution of 56% of coronary heart disease which resulted in the deaths of around 4.4 million every year worldwide. The data was predicted to increase continuously to 20 million per year until 2030 to 24 million per year ¹. In Indonesia deaths from heart and blood vessel disease amounted to 16.7% ¹².

Hypercholesterolemia occurred because of an increase in the transport of acylglycerol from the liver to blood circulation in the form of VLDL ^{4,10}. In the blood circulation VLDL was hydrolyzed by lipoprotein lipase become free fatty acids and glycerol ^{9,10}. Then,

they were transported to the tissues and became IDL which was an LDL particle precursor ⁶, remained in the blood circulation. LDL in the blood circulation was then taken by LDL receptors and translocated to cell membranes, past endosomes and lysosomes ²⁰. The increased lipoprotein containing cholesterol by LDL receptors results in high cholesterol concentrations in cells. the lipoproteins concentration enhancement which containing cholesterol in cells resulted in an increase of total cholesterol ^{9,10}.

At high LDL concentrations in the blood circulation there would be saturation in the process of taking lipoprotein containing cholesterol through LDL receptors ^{8,10}. Therefore LDL containing cholesterol was converted to oxidized LDL ⁴ which was not recognized by LDL receptors ^{9,10}. The oxidized LDL could not be taken by LDL receptors, so it was translocated to the cell membrane through scavenger receptors that had macrophage properties. Taking oxidized LDL which containing cholesterol by scavenger receptors for a

Correspondence Author :

Hasyim As'ari,S.Kep.

Ns.M.Ked hasyim@poltekkesdepkes-sby.ac.id

long time resulted in the formation of foam cells in atherosclerotic lesions².

Decreasing LDL concentrations containing cholesterol in blood circulation is carried out through exercise and diet modification containing unsaturated fatty acids. Regular exercise can increase lipoprotein lipase expression due to increased insulin sensitivity. Diets of unsaturated fatty acids can increase the catabolic rate of LDL containing cholesterol due to the addition of the number of LDL receptors. If exercises and dietary modifications of unsaturated fatty acids fail to reduce cholesterol, it can be done by management of a plasma lipid-lowering drug (hypolipidemic)^{9,10}.

Hypolipidemic drugs could reduce cholesterol by mechanisms including; inhibiting enterohepatic circulation of bile acid, inhibiting cholesterol absorption from gastrointestinal^{9,10}, decreasing plasma triacylglycerol, inhibiting HMG-CoA reductase, and increasing lipoprotein lipase activity. However consuming hypolipidemic drugs had an impact in the form of gastrointestinal disorders, skin rashes, liver function disorders and the existence of contra-indications of use that resulting in not everyone can consume¹³.

The management of herbal-derived hypolipidemic was highly recommended. Herbs were a source of compounds that had potential as a drug base, one of which was mangosteen rind (*Garcinia mangostana* L). In the pericarp, it contained mangostin compounds, reaching 75 mg / 100 mg¹⁸. Mangostin had inhibitory activity for inhibiting the release of prostaglandin E¹¹, that resulted in a decrease in lipolysis of adipose tissue^{9,10} and was thought to increase the activity of the lipoprotein lipase enzyme³.

The decrease in lipolysis of adipose tissue results in a decrease of free fatty acids in the blood and liver circulation. So that the esterification of free fatty acids becomes acylglycerol in the form of VLDL containing cholesterol which is transported from the liver blood circulation to decrease. Decreasing VLDL production results in decreasing IDL levels. The decrease in IDL which was an LDL-forming precursor containing cholesterol in the blood circulation resulted in a decrease of total cholesterol in the blood^{9,10}.

Metode

This research was an experimental laboratory with a posttest control group design²⁰ as a study design between

the independent variable of *Garcinia mangostana* L. Rind extract and the dependent variable of total cholesterol levels. The population was male white mice (*Ratus norvegicus*) aged 3-4 weeks with a weight of 100-200 grams¹⁶. Samples numbers were 6 for each group⁵. Data collection of measurement of total cholesterol levels used enzymatic method with a spectrophotometer, the data analysis used Variant Analysis statistical test (ANOVA) with a significance level of $\alpha < 0.05$ ¹⁵.

The Result of Study

1. The results of the total cholesterol concentration tests between the non-induced MDTL group and induced MDTL groups (High-Fat Diet Foods)

Tabel 1. The results of the total cholesterol concentration tests between the non-induced MDTL group and induced MDTL groups (High-Fat Diet Foods)

Dependent Variable	Group		Sig. (p)
	the non-induced MDTL group N = 6	induced MDTL groups N = 6	
Total Cholesterol (Mean \pm SD)	56,17 \pm 4,53	68,17 \pm 8,61	0,010

The results of the study in table 1 showed that total cholesterol levels induced by MDTL had a significant increase compared to the group before MDTL was induced with $p = 0.010$

2. Data on body weight, the total cholesterol levels variable in the control group and treatment group

The analysis results of initial body weight, final weight, changes in body weight, total cholesterol levels between the control group and the treatment group which treated by mangosteen pericarp rind extract (*Garcinia mangostana* L.) at a dose of 50 mg / kgBB, 150 mg / kg BW, 250 mg / kg BB and 350 mg / kg BB.

		Extract of 250 mg	-6.833	5.569	.231

In table 5 showed that there was a decrease in total cholesterol with a significant difference ($p < 0.05$) between the control group and the mangosteen pericarp rind extract group (*Garcinia mangostana* L.). extract dose of 50 mg / kg BB ($p = 0,008$), extract dose of 150 mg / kg BW ($p = 0,015$) and extract dose of 250 mg / kg BW ($p = 0,001$), while group of extract dose 350 mg / kgBB ($p = 0,000$)

In Table 5 showed that there was a significant decrease ($p < 0.05$) compared to total cholesterol between the dose groups of mangosteen pericarp rind extract (*Garcinia mangostana* L.) 50 mg / kgBB and the control group ($p = 0.008$) and group extract 350 mg / kgBB ($p = 0.038$). However there was no significant difference of the extract dose of 150 mg / kgBB ($p = 0.790$) and extract dose of 250 mg / kgBB ($p = 0.347$).

For the total cholesterol in the dose group of mangosteen pericarp rind extract (*Garcinia mangostana* L.) of 150 mg / kgBB, there was a significant decrease ($p < 0.05$) between the mangosteen pericarp rind extract group (*Garcinia mangostana* L.). dose of 150 mg / kgBB with control ($p = 0.15$) and extract dose of 350 mg / kg

BB ($p = 0.021$), meanwhile administering the extract dose of 50 mg / kgBB ($p = 0.015$) and extract dose of 250 mg / kgBB ($p = 0.001$) there was a significant decrease ($p > 0.05$).

For the total cholesterol in the dose group of mangosteen pericarp rind extract (*Garcinia mangostana* L.) 250 mg / kgBB, the ratio of significant decrease was only on the control group ($p = 0.01$), whereas on the group dose of 50 mg / kgBB, 150 mg / kgBB and 350 mg / kgBB there was no significant differences with $p > 0.05$. In comparison with the dose group of mangosteen pericarp rind extract (*Garcinia mangostana* L.) 350 mg / kgBB for the total cholesterol there was a significant decrease with the control group ($p = 0,000$), dose of 50 mg / kgBB ($p = 0.038$), and dose of 150 mg / kgBB (0.021). For the extract dose of 250 mg / kgBB there was no significant difference ($p = 0.231$).

Discussion

Food induction of a high-fat diet (MDTL) in white rats consisting of a mixture of beef fat and palm oil in a ratio of 1: 5 as much as 2% of body weight for 7 days

aimed to optimize rat blood cholesterol levels⁷. The induction of MDTL containing sterols and triglycerides was estimated to reduce LDL receptors and the formation of VLDL particles of smaller size and contained more cholesterol^{9,10}. The enhancement of LDL containing cholesterol resulted in the taking through LDL receptors experienced saturation. Therefore it changed into modified LDL with oxidation which was not recognized by LDL receptors^{9,10}. Oxidized LDL interacts well and is absorbed by lower affinity systems in macrophages and other cells called *scavenger receptors*. However not all oxidized LDL were taken by macrophages. This was due to the availability of fatty acyl substrates by the enzyme Acyl-CoA; cholesterol transferase (ACAT) which was limited to macrophages which were loaded by oxidized LDL². Oxidized LDL was not taken by macrophages that were in the membrane as far as it was unable to inhibit the HMG-CoA reductase enzyme, so cholesterol synthesis in the cell itself continues. This situation caused an increase of cholesterol in the blood^{9,10}.

The variance analysis test showed that there was a significant effect ($p < 0.05$) on total cholesterol levels between the control group and the treatment group dosing *Garcinia mangostana L.* rind extract. This decrease was consistent with the results of previous studies conducted by Dachriyanus by giving as suspension of pure mangostin in mice showed a decrease in serum total cholesterol reaching 24%³.

This decrease was due to mangosteen pericarp rind extract (*Garcinia mangostana L.*) which containing mangostin had an inhibitory activity against the inhibition of prostaglandin E release¹¹. Prostaglandin E could cause resistance to the activity of the enzyme adenylyl cyclase, an enzyme that converted ATP to cAMP. cAMP synthesis Obstacles resulted in inactive conversion of hormone-sensitive lipase enzymes into the active form of the lipase enzyme through protein kinase¹⁷ to be disrupted. As a result the lipolysis process decreased^{9,10}. The lipolysis reduction in adipose tissue resulted in a decrease in free fatty acids in the blood circulation. In this condition free fatty acids will enter the liver with low concentration. Decreasing the esterification concentration of free fatty acids to acylglycerol which transported from the liver in the form of VLDL decreased. Decreasing VLDL production resulted in a decrease of IDL levels which was the LDL former containing cholesterol. Therefore cholesterol in the blood circulation decreased^{9,10}.

The total cholesterol reduction also occurred because of *Garcinia mangostana L.* rind extract containing mangostin is very effective in saving the use of α -tocopherols which are antioxidants and play a role in breaking the chain. α -tocopherols plays a role as donors of hydrogen phenolic and a less reactive radical tocopheroxyl substitutes (α -TO•) or as direct reactants with radical initiation to prevent the formation of LOO• to form non radical products (NRP)¹⁴, one of which is *Malondialdehyde*¹⁹. Decreasing Malondialdehyde reduces *adducts* with amino acid side chains from apolipoprotein B-100^{9,10}, resulting in reduced oxidation interaction and absorption of LDL by a lower affinity system called scavenger receptor which results in LDL oxidation containing cholesterol decreases^{9,10}. Decreasing or damaging malondialdehyde resulted in reducing *adducts* between malondialdehyde and amino acid side chains of apolipoprotein B-100 and reducing the interaction and absorption of oxidized LDL by a lower affinity system called scavenger receptor^{9,10}. As a result of reduced interaction and absorption of oxidized LDL, oxidized LDL was also reduced by macrophages resulting in fatty acyl substrates by the enzyme Acyl-CoA; cholesterol transferase (ACAT) in macrophages that were filled with oxidized LDL was sufficient and would be able to inhibit the HMG-CoA reductase enzyme in cell membranes², so that cholesterol synthesis was reduced^{9,10}.

Conclusion

Giving rind extract of *Garcinia mangostana L.* with a dose of 50 mg / kgBB, 150 mg / kgBB, 250 mg / kgBB and a dose of 350 mg / kgBB can significantly reduce total cholesterol levels of male hypercholesterolemic white mice with a significance level of $p < 0.05$.

Abstract

Low activity of antioxidant enzymes due to polymorphism in antioxidant genes and differences in mineral and metal levels creates oxidative stress that may play a role in advancing many diseases. The aim of this study was to determine the role of Manganese superoxide dismutase (MnSOD) gene polymorphism [rs4880 Val16Ala] in exposed workers and to compare the levels of metals and minerals among its various genotypes in control group. A total of 80 individuals including age and gender matched workers and control group were genotyped. Detection of rs4880 polymorphism was done using sequencing technique. The blood serum were tested for determination of metals and minerals using Atomic absorption spectrophotometer (AA 6600 Shimadzu). This study indicate that the frequency of T allele was higher than that of C allele in control group as well as in workers. Our results indicate no association between all genotypes in study subjects. The results of present study indicates that Pb and Cd concentration differ significantly between TT genotypes of MnSOD (rs4880) gene polymorphism as compared to CC genotypes in workers and control group ($p < 0.05$). Control group with TT, TC and CC genotypes have high concentration of Fe, Cu and Zn as compared to workers group.

Key Words: Heavy Metals, MnSOD, Polymorphism, PCR, Workers.

Introduction

Oxidative stress is responsible for a number of pathological and physiological circumstances, including atherosclerosis, diabetes, aging, osteoarthritis, types of cancer, inflammatory bowel diseases, and more^(1,2). Oxidative stress is a word used to demonstrate the cell imbalance between prooxidant manufacturing and cell antioxidant defense. It happens either owing to deficiencies in antioxidant protection structures or due to excessive reactive nitrogen species (RNS) and reactive oxygen species (ROS) manufacturing⁽³⁾.

ROS may result from inherent variables such as mitochondria, peroxisomes and inflammatory cell activation, and contact with extrinsic variables including environmental, pharmaceutical and industrial chemicals^(4,5). Oxidative stress caused by ROS which are typically balanced by antioxidant defenses of the cell⁽⁴⁾. Oxidative stress may cause protein, DNA and lipid damage, leading to an arisen chance of chromosomal aberrations, genetic mutation and alteration of cell growth that may happen in cancer⁽⁶⁾.

In the human body, numerous mechanisms protect cellular systems against oxidative damage. These processes include some intracellular enzymes such as superoxide dismutase(SOD), catalase(CAT), glutathione peroxidases(GPX), reductase of thioredoxin, and peroxidases. Some of the antioxidant enzymes which defense against oxidative damage are polymorphic⁽⁷⁾.

Manganese superoxide dismutase(MnSOD), is one of the essential antioxidant enzymes which convert superoxide radicals to H_2O_2 and O_2 in mitochondria, and thus represents a first line defense in mitochondria against ROS (8). Therefore, the polymorphisms of the MnSOD gene have crucial role on the maintenance of ROS levels in cells^(8,9). The structure of the MnSOD gene comprises of five exons interrupted by four introns and the promoter. Several polymorphisms in distinct regions of the MnSOD gene have been recognized⁽¹⁰⁾. These polymorphisms were correlated with various illnesses. MnSOD is encoded by the nuclear MnSOD gene situated on the human chromosome 6q25 and the exon 2 of the human MnSOD gene identifies the Val16Ala polymorphism. Val16Ala (47T > C) is a commonly researched SOD2 single nucleotide polymorphism (SNP) on the MnSOD gene^(10,11). MnSOD Val16Ala polymorphism is found in the mitochondrial targeting sequence and was suggested to alter the peptide structure, affecting protein translocation and maturation in the mitochondrial matrix⁽¹²⁾. This polymorphism was linked to various pathologies including asthma⁽¹³⁾, diabetes⁽¹⁴⁾, aging⁽¹⁵⁾, cardiomyopathy⁽¹⁶⁾ and cancer⁽¹⁷⁾.

ROS production is not only influenced by polymorphism in antioxidant genes but it is also affected due to exposure of heavy metals. Heavy metals like lead (Pb), cadmium (Cd), chromium (Cr) and nickel (Ni) creates oxidative stress and contributes in the development of many human diseases which includes degenerative lung and heart conditions, Alzheimer disease and rheumatoid arthritis⁽¹⁸⁾.

To our knowledge, there were no study conducted to study the association between heavy metal concentration and Val16Ala Ala16Val polymorphism in exposed workers. Therefore, in the present study, the aim was to investigate the association between the genetic polymorphism MnSOD Val16Ala and exposed workers to heavy metals in Al-Nasiriyah city.

Materials and Method

This research was conducted in laboratories for the period from November 2018 to the end of April 2019 (Science College, College of Education for Pure Sciences, Mazaya Private College and Technical Institute in Al-Shatrah). 80 people (60 workers and 20 controls) were included in the present research. Worker groups were selected randomly from three industrial foundations in Al-Nasiriyah town center (1- Oil Refinery, 2- Car

Repair Workshops, and 3- Brick Factories). It included from each organisation 20 workers. The control group included people working in institutions that were far from being directly exposed to pollutants.

Sample collection

Approximately 7.5 ml of venous blood specimens were gathered from study group people. 2.5 ml were placed in the EDTA vacutainer tubes for genomic DNA extraction, while the remainder of the 5 ml blood was placed in a sterile plane tube and permitted to coagulate to distinguish the serum at 4000 rpm for 15 minutes by centrifugation. The genomic DNA and serum were stored at -20 c freezing , then used to amplification of MnSOD genes and estimation of heavy elements.

Metal analysis

The serum sample was used to analyze metals. The samples were processed by acid digestion method described by Ji & Ren,⁽¹⁹⁾. After acid digestion, the blood serum was evaluated by the atomic absorption spectrophotometer(FAAS.- Phoenix 986 AA. United kingdomUK.) to determine Pb, Cd, Fe, Cu and Zn.

Genetic analysis

DNA isolation and Genotyping.

Whole DNA was obtained through the use of gSYNCTMDNA Mini kit from white blood cells. MnSOD Val16Ala polymorphism was examined using sequencing method. Forward and reverse primers of MnSOD gene amplification were as follow: CAG CCC AGC CTG CGT AGA CGG -3' and reverse 5'- CTT GGC CAA CGC CTC CTG GTACTT -3') as defined by Souiden et al.⁽²⁰⁾ to amplify a 267 bp fragment as shown in Fig.1. The PCR program was initial denaturation at 95°C for 5 min followed by 30 cycles of 95°C for 40 sec. min, 59°C for 35 sec. (annealing) and 72°C for 35 sec. (extension). The reaction was completed by a final extension cycle at 72°C for 7 min. Amplified product was sent to a Macrogen Company to analyze the nucleotide sequence using a Genetic analyser device.

Fig.1. PCR products of MnSOD gene which analyzed on 2% agarose gel.

Statistical Analysis

All statistical analysis was conducted using version 17 of SPSS. Chi square test was used to compare the frequencies of genotype between workers and control group. Mean \pm standard deviation (Mean \pm SD) was used to explore the important distinctions between the metal values of the research groups. $P < 0.05$ were considered

statistically significant.

Results

The current study showed a high frequency of (TT) alleles compared to the frequency of other alleles (TC and CC) in other study groups, with no significant differences between the frequency of each allele in different groups. In the control group, 13 (65%) had TT genotype, 4 (20%) were heterozygote and had TC genotype and 3 (15%) had CC genotype. Among oil refinery workers, 12 (60%) items had TT genotype, 6 (30%) had TC genotype and 2 (10%) had CC genotype. The highest alleles frequency for group of car repair workers was TT genotype 14 (70%), while the other genotypes (TC and CC) were repeated at an equal rate of 15%. Out of 20 workers of brick factories, 10 (50%) had TT genotype, while 4 (20%) had TC genotype. The rest (30%) had CC genotype.

Table 1: Allele frequencies of the Ala16Val polymorphism among study groups

Study groups	TT n (%)	TC n (%)	CC n(%)	Total
Control	13 (65.00%)	4 (20.00%)	3 (15.00%)	20 (100.00%)
Oil Refinery	12 (60.00%)	6 (30.00%)	2 (10.00%)	20 (100.00%)
Car Repair Workshops	14 (70.00%)	3(15.00%)	3 (15.00%)	20 (100.00%)
Brick factories	10 (50.00%)	4 (20.00%)	6 (30.00%)	20 (100.00%)
Total	49 (61.25%)	17 (21.25%)	14 (17.50%)	80 (100.00%)
P.Value	0.870	0.327	0.319	

P.value \leq 0.05 means significant

This study was also intended to determine the concentration of distinct metals and minerals in separate MnSOD gene polymorphism genotypes. in workers exposed to heavy metals as compared to control. The mean concentration of Pb in TT genotype was 20 μ g/L and 17 μ g/L, in TC it was 18 μ g/L and 16 μ g/L, and in CC it was 18 μ g/L and 16 μ g/L respectively in workers and control group (Fig. 2). There was significant difference between TT and CC in exposed workers ($P < 0.05$). No significant difference was present between CC and

TC genotypes of MnSOD gene [rs4880 (Val16Ala)] polymorphism in control group as compared to exposed workers ($P > 0.05$).

The mean concentration of Cd was found to be 5 μ g/L, 4 μ g/L and 3 μ g/L in TT, TC and CC genotypes in workers and 4 μ g/L, 3 μ g/L and 3 μ g/L in TT, TC and CC genotypes in control group. Present finding indicated that significant difference occurred for Cd concentration between TT and other genotypes in workers and control group ($P < 0.05$). Control group with TT, TC and CC genotypes have high concentration of Fe, Cu and Zn as compared to workers group.

Fig. 2. Concentration comparison of A, Pb; B, Cd; C, Fe; D, Cu and E, Zn in different genotype carrier of MnSOD gene [rs4880 Val16Ala] polymorphism in workers and control group.

Discussion

Until now, no study has been revealed for study of association between MnSOD Val16Ala polymorphism and concentration of heavy metals. The findings of this research show that T allele frequency is greater than that of C allele in control group as well as in workers. Our results indicate no association between all genotypes in study subjects. Metal ion toxicity mechanism is partly

known, but it is obvious that they can generate ROS that involves nitrogen oxide (NO), superoxide ions (O₂⁻), hydroxyl (OH) and H₂O₂ with the assistance of Fenton / Haber-Weiss response⁽²¹⁾. No one has studied the association between MnSOD gene polymorphism and heavy metals in exposed workers. It is not fully understood the role of genetic variations in the MnSOD gene in altering the concentration of heavy metals. This aspect has also been attempted by the present research.

Concentration of Pb has been observed to change due to genotypes. In TT carriers in the workers and control group, the concentration of Pb was significantly high compared to the CC genotype. Similarly the finding of this study indicates that Cd concentration differ significantly between TT and CC genotypes of MnSOD1 gene [rs4880 (Val16Ala)] polymorphism in study subjects. A significant difference of Cd was present between TT and TC genotypes carriers in workers and control group as compared to CC genotype. These results indicate a complicated interaction of polymorphism of the MnSOD gene [rs4880 (Val16Ala)] with the concentration of Pb and Cd in the human body homeostasis. Although the result was observed that Fe, Cu and Zn concentration changed in all genotypes carriers in control group and workers but this difference was non-significant ($P>0.05$).

There is a gap in understanding of how metals and minerals interact in the antioxidant gene with MnSOD1 Val16Ala polymorphism (rs4880) which may affect progress of oxidative stress and development different diseases. Present information can assist to understand this polymorphism interaction with concentration of ion metals. Detailed study of exposure to minerals and metals will assist to confirm the relationship between genotypes and oxidative stress. In order to create the real picture of the association of MnSOD1 Val16Ala polymorphism (rs4880) and heavy metal concentration, further investigation is needed.

Conclusion

The present finding indicates that level of Pb and Cd increase in individual with TT genotypes. Regarding of Fe, Cu and Zn, this study suggested that the concentration of these mineral was changed slightly in all genotypes carriers in control group and workers but this difference was non-significant.

Ethical Clearance: The research and laboratory tests were approved by the Ethics Committee of the College of science for Pure Sciences / Thi-Qar University.

Seroprevalence of Hepatitis A Virus (HAV) in Mosul City

Ismail I Daood¹, Radhwan Hussein Ibrahim²

¹Assistant Professor, Department of Basic Nursing Sciences, College of Nursing, University of Mosul, Mosul, Iraq,

²Professor, Department of Clinical Nursing Sciences, College of Nursing, University of Mosul, Mosul, Iraq

Abstract

Background: Globally, there are about 1.5 million cases showing symptoms each year, with tens of millions likely to become infected. It is more common in areas of the world with poor sanitation and inadequate drinking water. The aim of the study is to identify percentage of the prevalence and distribution of hepatitis A (HAV) among the gender, age group.

Methods: Prospective study was applied in Mosul City for the period between July 2017 to June 2019. A seroepidemiologic survey about hepatitis A virus (HAV) infection was carried out in a group comprising 312 patients, ranging in age from 1 year to 60 years, from in the Mosul city. Three ml of blood were taken from the patients and Serum was separated and stored at -200C for the test.

Results: The results of the present study indicate that the total prevalence of type A virus in Mosul was (21.7%) and was distributed between males and females (14.4%) (7.3%), respectively. The infection rate was the highest in the age group (16-21 years).

Conclusion: According to the results of this study, the city of Mosul may be considered a settlement area for the hepatitis virus infection. So people responsible for health in the city must monitor programs to prevent transmission of the virus, which can be carried out in several ways.

Key Words: HVA, Prevalence, Mosul .

Introduction

Hepatitis A one of the viral disease that attack the liver and cause symptoms ranging from mild/severe.⁽¹⁻³⁾ By polluting Food, water or by direct contact with a person who is infected, the infection virus is transmitted.⁽⁴⁻⁵⁾ Very few people with hepatitis A may die from hepatitis and others can be recovering completely by life time immunity. Unsafe water and poor sanitation and personal hygiene e.g. contaminated hands is considered a major risk of hepatitis A.⁽⁶⁻⁸⁾ Hepatitis A infection does not cause chronic liver disease and is rarely fatal, as it can cause symptoms of debilitating hepatitis and

acute hepatitis (HP), which result in high mortality. A infection occurs in isolated somebody causa and in epidemics around the world and tends to occur periodically.⁽⁹⁾ The epidemic disease caused by food or water contamination can be very widespread, such as the epidemiological billet that swept China-Shanghai in 1988 and infected Three hundred thousand people. Hepatitis A viruses are prevalent in the environment and can resist the production and processing of food commonly used to disrupt and / or control bacterial pathogens.⁽¹⁰⁾ The disease can cause serious economic and social damage to local communities. It may take weeks or months for a patient to recover from his or her work, school, or daily life. It can have serious effects on food establishments that are identified as harboring the virus and their overall domestic productivity.⁽¹¹⁾ Geographical areas can be classified as high, moderate or low levels of hepatitis A infection. The symptoms of hepatitis are similar to the viruses that cause it, and the symptoms of hepatitis in children are similar to the symptoms of influenza,

including: ⁽¹²⁾ fever. Nausea. Vomiting. Anorexia. General fatigue. Sten in the upper right of the abdomen or pain, where the liver is located. Jaundice, this occurs due to the swelling of the liver, in addition to increased backup of the blood in the blood and clogged, leading to change the color of the urine to dark orange, and stool to light yellow or similar to clay color.⁽¹³⁻¹⁵⁾ With the possibility of previous symptoms, many children with hepatitis do not have any symptoms, and the absence of symptoms with age is inversely proportional to the increase in the risk of infection without symptoms as the age is smaller.⁽¹⁶⁾ Studies show that only 30% of children with symptoms younger than 6 are present, most of who appear mildly, and symptoms persist for several weeks in older children.⁽¹⁷⁻²⁰⁾ Hence, this study was designed to determine the sero-prevalence of antibodies to HAV among HCWs at National Institute for Pharmaceutical Research and Development (NIPRD) in Mosul City, Republic of Iraq.

Method

A prospective design was applied in the current study. Data were collected for the period between 1st of January 2018- 31 of December, 2018 in Mosul City-Iraq. A questionnaire was prepared to gather information related to patients who infected with the virus such as their drinking water quality and sources, toilets used and food preparation as well as the some information related to the family socio economic status and educational level. Agreement of the patient were gathered before they enrolled in the study.

Sample collection

For serological analysis for HAV (3mls) of venous blood was collected from each participant into standard sample bottles. The blood samples were collected

by well-trained phlebotomists. The samples were centrifuged at 4,452g for 10minutes and the recovered plasma were aliquoted into the well-labeled cryovials, and kept into -400C freeze until ready for the screening.

Serological Screening

Serological diagnosis was done using Rapid diagnostic tests (RDTs), for HAV infection the SD BIOLINE (Standard Diagnostic (SD) Inc., Korea) one step HAV test kit was used for detection of HAV infection and HAV antibodies was done using the SD BIOLINE HCV test kit. This is an immunochromatographic rapid test for the qualitative detection of antibodies specific to HAV in blood with a sensitivity of 100% and specificity of 99.4% according to manufacturer's instructions found on the standard operation procedure insert. The seropositive samples to HASAg detected by RDTs screening were further confirmed by Wesstern blot (Trinity Biotech, Bray, Ireland) according to manufacturer's specifications.

Data analysis

The data obtained from the study was analyzed using (SPSS) (version 20.0), descriptive statistics were presented in Tables. The Chi-square (X²) test was applied to determine the level of association of the prevalence of HAV among study samples with respect to sex and age distribution associations. Values of $P \leq 0.05$ were considered statistically significant.

Results

The results of the present study indicate that the total prevalence of type A virus in Mosul was (21.7%) and was distributed between males and females (14.4%) (7.3%), respectively. The infection rate was the highest in the age group (16-21 years).

Table (1) HAV Sero-positivity & Gender difference

Gender	Total	* No. Positive (%)	No. Negative (%)
Male	59	29 (47.4)	30 (50.8)
Female	70	14 (20)	56 (80)
Total	129	43 (33.3)	86 (66.7)
Male	53	6 (11.3)	47 (88.6)
Female	60	9 (15)	51 (85)
Total	113	15 (9.3)	98 (86.7)

Table (1) HAV Sero-positivity & Gender difference

Male	27	3 (11.2)	24 (88.8)
Female	43	7 (16.2)	36 (83.7)
Total	70	10 (14.2)	60 (85.7)
All total	312	68 (21.7)	244 (78.3)

Table 2 : Sero-prevalence of Anti – HAV (all markers) and gender difference

Gender	Total	IgG – ve	IgG + ve	* IgG + ve	* IgG - ve
		IgM – ve	IgM - ve	IgM + ve	IgM + ve
		Negative non reactive %	Reaction or Vaccination %	Positive or reaction %	Positive or reaction %
Male	59	19 (32.2)	17 (28.8)	16 (27.2)	7 (11.8)
Female	70	38 (54.2)	13 (18.5)	15 (21.4)	4 (5.9)
Total	129	57 (44.1)	30 (23.2)	31 (24.2)	11 (8.5)
Male	53	27 (50.9)	21 (39.6)	2 (3.7)	3 (5.8)
Female	60	13 (21.6)	38 (63.3)	5 (8.3)	4 (6.8)
Total	113	40 (35.4)	59 (52.2)	7 (6.2)	7 (6.2)
Male	27	18 (66.6)	5 (18.5)	2 (7.4)	2 (7.4)
Female	43	25 (58.2)	10 (23.3)	5 (11.6)	3 (6.9)
Total	70	43 (6.1)	15 (21.4)	7 (10)	5 (7.1)
Total	312	140 (44.8)	104 (33.3)	45 (14.4)	23 (7.3)

Table (3) : Age groups distribution of Sero-positivity anti–HAV antibodies

Age	Total	Anti – HAV antibodies	Anti – HAV antibodies
	No. Of case	Positive IgM , IgG (%)	Negative IgM , IgG (%)
5-Jan	30	9 (30)	21 (70)
10-Jun	36	10 (27.7)	26 (72.3)
15-Nov	25	6 (24)	19 (76)
16 - 20	52	17 (32.6)	35 (67.4)
>20	169	26 (15.3)	143 (84.7)
All total	312	68 (21.7)	244 (78.3)

Discussion

According to world Health Organization, about more four million people infected with HAV are in the middle east region. Due to the armies and political conflicted in these countries the accurate data about HAV Sero-prevalence are very imperfect.⁽²¹⁾ One of the these country is Iraq and Especially City of Mosul which attacked by for more than three years and the health care system was breakdown. The aim of the present study is to estimate the sero-prevalence of HAV in Mosul City the Capital city of Nineveh Governorate among specific age group. The finding of current study shows that, among 312 patients with a clinical presentation of viral hepatitis, (21.7%) had positive serum anti-HAV antibodies. These results mirrors of three years of the poor sanitation ,and unsafe water supply as well as bad hygienic situation of the City. According to Turkey et.al.⁽¹⁵⁾ the HAV infection is hyper endemic in Iraq with a national estimate of IgG sero-prevalence rate of 98% in the 5th decade and older age group (41+). The result is higher rate than finding of previous studies that conducted in recent years in other Iraqi Province like Basrah, Dehouk and Kirkuk.⁽²²⁾ Safiabadi et.al⁽²³⁾ stated that Hepatitis A is strongly associated with hygiene factors and has increased rates of infection during periods of war and conflict, according to recent statistics of infection in countries such as Iraq, Afghanistan, Yemen and Syria. Similarly to previous studies in Iraq and Kingdom Saudi Arabia, the gender has no significant differences were found between male and female infected.⁽¹⁶⁾

Recommendation: According to the results of this study, the city of Mosul may be considered a endemic area for the hepatitis virus infection. So the stakeholders in the city must monitor programs to prevent transmission of the virus, which can be carried out in several ways.

Conflicts of Interest: None declared.

Funding: There is no funding relevant to this study.

Acknowledgment: The authors wish to thank and acknowledge the members of the Review Board of Ethical Research Committee ,Mosul City for granting us the ethical approval for the study. Finally, the study participants are highly appreciated for their valuable time and support.

Abstract

There is widespread of PSA using as a Prostate Cancer biomarker (threshold of 4ng/ml),but there is no single PSA value that avoids missing serious cancers at a treatable phase, avoids false-positives and unnecessary prostate biopsies. The evaluation of the clinical significant of [-2]proPSA and the Prostate Health Index (PHI) in diagnosis of Prostate Cancer was done in this research to enhance the correct prediction of the prostate cancer. The aim, of this study is to improve the method of testing by using newer PSA biomarkers in the subject sera for evaluating the diagnostic significance of [-2]proPSA and Prostate Health Index (PHI) in the detect of prostate cancer in early stages. A case-control research comprising 54 patients over 50 years old age having Prostate Cancer and Benign Prostatic Hyperplasia recruited from Iraqi urological clinics unit and AL-Amal National Hospital for Cancer Management during the period from July 2018 to March 2019. There was a significantly high difference ($P < 0.001$) of serum PSA, P2PSA and PHI levels among all the study groups. The cut-off values of [-2]proPSA and Prostate Health Index (PHI) based on the ROC curve results in current study were >322 pg/ml and >578 respectively for Prostate cancer patients, while their values range between 322-89 pg/ml, and 578-209 respectively for BPH patients, and <89 pg/ml and <209 for apparently healthy men respectively, the area under curve (AUC) of (P2PSA) and PHI were 0.968, 0.960 for PCa group against noncancerous group respectively, 0.85 and 0.796 for BPH group against control group respectively. Their levels show significant increase in PCa patients in comparison with noncancerous group and in BPH patients when compared with control group.

Keywords: (-2)proPSA; prostate cancer; Prostate Health Index; prostate-specific antigen.

Introduction

Prostate-Specific Antigen (PSA) is well-known prostate cancer (PCa) detection serum biomarker in its early presence⁽¹⁾. According to recent studies, PSA fails to be considered as an accurate PCa predictor biomarker (limited by poor specificity)⁽²⁾.

A considerable effort has been made as a consequence in order to find new biomarkers for the accurate diagnosis of PCa⁽³⁾.

The bound forms of PSA found in serum account 80%–95% and the other minor form found as an unbound (free) state, which involves 3 isoforms: benign PSA (BPSA), proPSA and intact PSA. In addition, a number of truncated proPSA isoforms, involving (-2) proPSA, (-5) proPSA, and (-7) proPSA are present.

Main prostate cancer-specific isoform is [-2]proPSA isoform and it has been concentrated preferentially on immunohistochemical staining in prostate cancer tissue also it has been highly increased in the serum of Prostate Cancer patients⁽⁴⁾.

A test called the Prostatic Health Index (PHI) is a recent equation which joins the PSA, free PSA and [-2]proPSA as one formula which can be applied in order to assist making the correct diagnosis⁽⁵⁾.

In addition, the equation is also effective in discriminating BPH patients from PCa patients in males, especially those with prostate cancer⁽⁶⁾. The score of PHI was validated⁽⁵⁾, then replication of this validity through many multicenter follow-up clinical trials in various countries⁽⁷⁾. The majority of the researches' objectives are

to evaluate the detection significance of PHI in the PSA values between 2-10 ng/ml, as well termed as the detection “gray zone” and little researches have been reported regarding the PHI efficacy even when the patients PSA value exceeds 10 ng/ml. There is a non-negligible rate of males with PSA values higher than 10 ng/ml that possibly who non-cancerous and the rise in PSA values might be a consequence of asymptomatic prostatic inflammation or a result of prostate enlargement⁽³⁾. So we aimed in this study: To improve a method of testing by using newer PSA markers in the subjects sera for evaluate diagnostic significance of [-2]proPSA and PHI in detection of PCa in early stage.

Materials and Method

A case-control research was executed from August 2018 till February 2019. A sample of Iraqi patients >50 years old was diagnosed as Prostate Cancer or Benign Prostate Hyperplasia patient in: AL-Imamain AL-Kadhimain Medical City, Al-Shahid Ghazi Al-Hariri Specialized Surgery Hospital/Urology Consultation Unit, Al-Amal National Hospital for cancer management in Baghdad city. The study includes 84 samples consist of 3 groups: 24 prostate cancer cases, 30 benign prostatic hyperplasia cases and 30 apparently healthy subjects as control.

The current study comprised patients who undergo prostate biopsy for assumed PCa depending on physicians instructions. The patients >50 years old age with prostate cancer and benign prostatic hyperplasia were included in the study; while patients with acute bacterial prostatitis, sexually transmitted infections, patients with chronic renal failure and Patients on finasteride or dutasteride therapy for prostatic disease were excluded. Blood sample were aspirated using disposable syringes in the sitting position. Serum PSA, free PSA and [-2]proPSA estimated by using ELISA technique. PHI was calculated

by applying the equation: $(p2PSA/fPSA) \times \sqrt{PSA}$ ⁽⁵⁾.

Results

There was a significantly high difference ($P < 0.001$) among the all study groups regarding serum PSA and fPSA/PSA% levels. When PSA results were compared between each two groups, a very highly significant increase ($P1 < 0.001$); ($P3 < 0.001$) was found between Prostate Cancer group in comparison with both control group and Benign Prostatic Hyperplasia group respectively, while there was no significant difference ($P2 = 0.859$) between Benign Prostatic Hyperplasia group versus control group.

Regarding fPSA/PSA% results; comparison between each two groups; There was a very significantly high decrease ($P1 < 0.001$) ($P3 < 0.001$) between Prostate Cancer group in comparison with control group and Benign Prostatic Hyperplasia group respectively; in contrast, no significant decrease ($P2 = 0.416$) was found between Benign Prostatic Hyperplasia group against control group (Table 1).

As well as, when the comparison applied for Prostate Specific Antigen PSA derivatives P2PSA and PHI the findings were as listed in table 1: There was a very significantly high increase ($P < 0.001$) among all study groups. When [-2]proPSA and Prostate Health Index PHI results were compared between each two groups, a very highly significant increase ($P1 < 0.001$), ($P3 < 0.001$) was found between Prostate Cancer group in comparison with both control group and Benign Prostatic Hyperplasia group respectively. Also, concerning [-2]proPSA and Prostate Health Index PHI results; a very highly significant increase ($P2 = 0.005$), ($P2 < 0.001$) was found between Benign Prostatic Hyperplasia group versus control group respectively (Table 1).

Table 1: Statistical analysis of Biochemical measurements related to prostatic specific antigen (PSA)

Characteristic	Prostatic carcinoma n=24	BPH n=30	Control n=30	P	P1	P2	P3
	Mean±SEM	Mean±SEM	Mean±SEM				
PSA (ng/ml)	124.12±21.19	5.12 ±0.50	2.57±0.11	<0.001 † HS	<0.001 € HS	0.859 € NS	<0.001 € HS
fPSA/PSA%	11.00 ±1.39	26.71±2.42	24.45±1.90	<0.001 † HS	<0.001 € HS	0.416 € NS	<0.001 € HS

Cont... Table1:Statistical analysis of Biochemical measurements related to prostatic specific antigen(PSA)

P2PSA (pg/ml)	684.75±73.20	236.81±26.40	74.48 ±17.58	<0.001 † HS	<0.001 € HS	0.005 € HS	<0.001 € HS
Prostate health index (P.H.I)	801.39±54.42	440.64±26.86	164.95±17.98	<0.001 † HS	<0.001 € HS	<0.001 € HS	<0.001 € HS

n:number of cases;data were presented as either mean±standard error of mean(SEM);†:One way ANOVA;€: post hoc LSD test;HS:highly significant at P≤ 0.01;NS: not significant at P≤ 0.05; S:significant at P≤ 0.05;P1:P-value for Control vs carcinoma;P2:P-value for Control vs BPH;P3:P-value for Carcinoma vs BPH,PSA: prostate specific antigen,fPSA/PSA%:free prostate specific antigen/prostate specific antigen%;P2PSA:-2pro prostate specific antigen.

The validity indicators such as sensitivity,specificity and AUC for the present diagnostic biomarkers;serum PSA and fPSA/PSA%based on receiver operation characteristic (ROC) curve(Figure1A) were calculated as illustrated in table 2.

Regarding to PCa group versus noncancerous subjects;according toROC curve of serum PSA level,the cut-off value≥9.57ng/ml optimally identified the patients with Prostate Cancer from those who are noncancerous;at this cut-off value the sensitivity was87.5% , specificity

was 100% and the AUC was 0.983.A very highly significant increase (P<0.001) was found between Prostate Cancer versus noncancerous groups .

Regarding serum fPSA/PSA% level; the cut-off value≤11.1optimally identified the patients with Prostate Cancer from those who are noncancerous; at this cut-off value the sensitivity was 75%,specificity was 98.33% and the AUC was0.888.Very high significant decrease(P<0.001)was found between Prostate Cancer group versus noncancerous group(Table 2).

Table 2:Cut-off value, Sensitivity, Specificity and Area Under Curve of Receiver Operation Characteristic(ROC)Curve of Prostate-Specific Antigen(PSA) and its related biomarkers between Prostate Cancer versus group noncancerous group:

Characteristic	PSA(ng/ml)	fPSA/PSA%	P2(pg/ml)	PHI
Cut-off	>9.57	≤11.1	>322	>578
AUC	0.983	0.888	0.968	0.960
Sensitivity	87.5	75	100	91.67
Specificity	100	98.33	91.67	93.33
P-value	<0.001	<0.001	<0.001	<0.001

PSA:Prostate Specific Antigen,fPSA/PSA%:free Prostate Specific Antigen/Prostate Specific Antigen % ,P2PSA:-2Pro Prostate Specific Antigen PHI:Prostate Health Index.P -value:very highly significant at P≤ 0.001;significant atP≤ 0.05.

As shown in table 3; regarding BPH group versus control groupbased on ROC curveof serum PSA level(Figure1B);the cut-off value≥3.17ng/ml ideally established the patients with BPH from those who are apparently healthy men;at this cut-off value the sensitivity was77.78%,specificity was88.1% and the AUC was0.789.A very highly significant increase(P<0.001) was established between BPH category versus control

category.

Regarding,serum fPSA/PSA% level,the cut-off value≤31optimally identified the patients with BPH from those who are apparently healthy men;at this cut-off value the sensitivity was38.89%,specificity was88.1%,and the AUC was0.57.There was no significant difference(P= 0.436)between BPH group

versus control group(Table3).

Thus,in a sample of Iraqi patients;The cut-off values of PSA based on the ROC curve results in current study was ≥ 9.57 ng/ml for Prostate cancer patients,while its value range between 9.57-3.17ng/ml for BPH

patients,and < 3.17 ng/ml for apparently healthy men respectively,and the cut-off value of serum fPSA/PSA% level was $\leq 11.1\%$ for Prostate cancer patients,range between 11.1%-31% for BPH patients and $> 31\%$ for apparently healthy men respectively.

Table 3: Cut off value,Sensitivity,Specificity and Area Under Curve of Receiver Operation Characteristic(ROC)Curve of Prostate-Specific Antigen(PSA)and its related biomarkers between BPH group versus control group:

Characteristic	PSA(ng/ml)	fPSA/PSA%	P2(pg/ml)	PHI
Cut-off	> 3.17	< 31	> 89	> 209
AUC	0.789	0.57	0.85	0.796
Sensitivity	77.78	38.89	100	94.44
Specificity	88.1	88.1	64.29	64.29
P-value	0.001	0.436	< 0.001	< 0.001

PSA: Prostate Specific Antigen fPSA/PSA%: free Prostate Specific Antigen/Prostate Specific Antigen %
 P2PSA: 2-Prostate Specific Antigen PHI: Prostate Health Index P -value: very highly significant at $P \leq 0.001$; significant at $P \leq 0.05$.

The sensitivity,specificity,Area Under Curve and the cut-off thresholds of serum[-2]proPSA and PHI based on ROC curve were obtained to evaluate to what extent the level of possibility of these new chemical biomarkers is contributing and supporting strongly the accurate diagnosis side by side with other chemical biomarkers formerly present (Table2) and (Table3).

The finding of serum The[-2]proPSA level for Prostate Cancer group compared with non-cancerous groups were as following: The cut-off value ≥ 322 pg/ml ideally established the Prostate Cancer patients from those who are noncancerous;at this cut-off value the sensitivity was 100%,specificity was 91.67%and the AUC was 0.968.Regarding these findings;A very highly significant increase($P < 0.001$)was found between these two groups.

Figure 1: Receiver operation characteristic curve of PSA and fPSA/PSA% between Prostate Cancer versus noncancerous group.

Concerning serum Prostate Health Index(PHI) results for Prostate Cancer group compared with non-cancerous group;the cut-off value ≥ 578 optimally identified the patients with Prostate Cancer from

those who were noncancerous;at this cut-off value the sensitivity was 91.67%,specificity was 93.33%and the AUC was 0.960.A very highly significant increase($P < 0.001$) was found between these two

groups(Table2),(Figure2A).

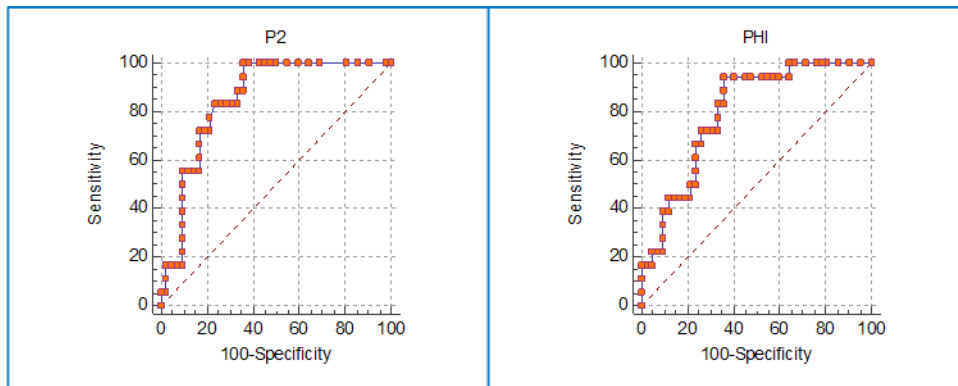

Regarding serum[-2]proPSA level for BPH group versus control group;the cut-off value ≥ 89 pg/ml ideally established the patients with BPH from those who are apparently healthy men;at this cut-off value the sensitivity was100%,specificity was64.29% and the AUC was0.85.

Figure 2:Receiver operation characteristic curve of P2PSA and PHI between Prostate Cancer group and non-cancerous group.

Concerning serum Prostate Health Index(PHI)results for BPH group against control group;the cut-off value ≥ 209 optimally identified the patients with BPH from those whom apparently healthy men;at this cut-off value the sensitivity was 94.44,specificity was 64.29%,and the AUC was0.796.A highly significant increase was found($P<0.001$) between BPH group and control group(Table3)(Figure2).

Figure 3:Receiver operation characteristic curve of P2PSA and PHI between Benign Prostatic Hyperplasia group and control group.

Thus,in a sample of Iraqi patients;this finding means that the cut-off values of(P2PSA) and Prostate Health Index(PHI)based on the ROC curve results in current study were ≥ 322 pg/ml and ≥ 578 respectively for Prostate cancer patients,while their values range between322-89pg/ml,and578-209respectively for BPH patients,and < 89 pg/ml and < 209 for apparently healthy men respectively.

Discussion

In Iraq,Iraqi Cancer Registry in 2016 exhibited that the highest incidence of cancer was among the breast cancer and the lowest was among the Prostate cancer,also the incidence rate(Per100,000Population)of Top Ten Cancer in Males in Iraq in 2016 for Prostate Cancer was 4.13⁽⁸⁾.

The current study findings may be useful for research in future, and our attempt to evaluate new Prostate Cancer diagnostic biomarkers may assist in diagnosis of Prostate Cancer in Iraq. The validity indicators of these new biomarkers have been determined all to be appropriate for that objective.

Prostate specific antigen PSA inaccuracy was established in our study because of false-positive and false-negative indications, whereas Prostate Cancer detection when PSA value 4 ng/ml accepted as a cut-off value; induced in a rate of (15 patients from 39) false positive which accounts 38.46%. It represents that from 39 patients who predictable Prostate Cancer, just 24 cases from them have been proved to be with the disease which account (61.54%). Also, only low percentage (15 patients out of 54) which accounts 27.77% of true negative rate when the value of prostate specific antigen (PSA) levels lower than 4 ng/ml showed no pathological characteristics of Prostate Cancer. A Study for Prostate Cancer (ERSPC) including 162,387 men in European Randomized reported that the PSA test resulted in 75.9% false-positive rate⁽⁹⁾. This false rate was clarified by many factors, such as prostate enlargement like BPH that can elevate PSA value, and without presence of cancer⁽¹⁰⁾ further more, high BMI lowers PSA level⁽¹¹⁾, in addition, the age of males can alter PSA values⁽¹²⁾.

However PSA is regarded as the better prostate cancer diagnostic tumor marker, it is indeed stay a long way from being optimal since there is no ideal value which confirmed Prostate Cancer diagnosis.

In addition, many studies use the fPSA/PSA percent in order to enhance specificity of prostate cancer diagnosis. The lack of absolute data which can demonstrating the ideal fPSA/PSA percent that must be used⁽¹³⁾, in present study; in a sample of Iraqi patients: The cut-off value of fPSA/PSA percent based on ROC curve results finding was $\leq 11.1\%$ for Prostate cancer patients. In 2011, SM Asafudullah et al, concluded that despite various cut-off values for fPSA/PSA percent interval from $<10\%$ to 25% that used via different researchers with difference but satisfactory specificity and sensitivity but the highest rate of prostate cancer cases (approximately 95%) was present to be combined with cut-off value less than 25% in various researches⁽¹⁴⁾, and the findings of our study were well confirmed with them.

Several novel serum biomarkers including [-2] proPSA and Prostate Health Index (PHI) have been developed and significantly increased the prediction potential of detecting Prostate Cancer⁽⁶⁾.

In this work, in order to evaluate these new biomarkers contributing in PCa diagnosis; a sample of Iraqi patients with Prostate Cancer and BPH patients according to Receiver Operation Characteristic (ROC) Curve results of serum (-2) pro Prostate-specific antigen [-2] proPSA and Prostate Health Index (PHI) levels show significant increase in PCa patients comparing with noncancerous group and in BPH group comparing with control group. The results were specific, simple and inexpensive blood tests with additional increase in PCa predictive value that could be used as part of a multivariable approach consisting of PSA and fPSA% biomarkers.

The study results were in harmony with that of Catalona et al. who concluded that results from a separate multi-site study supported the role of p2PSA and PHI as new useful predictors biomarkers of PCa in combination with PSA and fPSA% in reducing unnecessary biopsies⁽⁵⁾, also agreed with Massimo Lazzeri, et al and Heavner, Matt, et al in supporting the diagnostic significance of PHI even when PSA values exceeds 10ng/ml^(3,15) but disagreed with Mariyam Akizhanova et al. who reported that the correlation which found between PHI and the prediction of Prostate cancers poor⁽¹⁰⁾.

Conclusions

Finally, we concluded that: P2PSA and PHI levels have significantly improved validity indicators and diagnostic accuracy in diagnosis and differentiation between men with and without PCa as part of a multivariable approach to PSA and fPSA% tests.

The Effect of Buzz Group Modification Method on Exclusive Breastfeeding Against Self Efficacy in Pregnant Women: A Quasi Experiment

Febyana Dwi Cahyantia¹, Lailatun Nimah¹, Retnayu Pradanica¹

¹Faculty of Nursing, Universitas Airlangga, Surabaya, Indonesia, Universitas Airlangga Kampus C, Jl. Mulyorejo, Surabaya, Kota SBY, Jawa Timur

Abstract

Background: Exclusive breastfeeding for six months is an effort to increase the breastfeeding benefits and reduce infant mortality rate. Self efficacy is one of the factors that can influence the level of confidence exclusive in breastfeeding.

Aim: This study aimed to identify the level of self efficacy before and after given modified buzz group method and to the influence of modified buzz group method about exclusive breastfeeding against self efficacy in pregnant mother

Method: This study was designed using quasi-experimental design. The study was conducted in the working area of the health center. The total population used in this study was 42 pregnant women. A total sample of 38 respondents was taken according to purposive sampling. BSES-SF (Breastfeeding Self Efficacy Scale Short Form) questionnaire was administered at pre-test and post-test. Data analysis was performed using the Wilcoxon Signed Rank test and the Mann Whitney test.

Results: The results showed that the Wilcoxon Signed Rank statistical test obtained p value of 0,000 in the treatment group and p value of 0.355 in the control group. The Mann Whitney statistical test obtained a significant value of p = 0,000 at the post-test. The modification of the buzz group method took effect to increased self efficacy about exclusive breastfeeding for pregnant mother because this method was organized by four sources of self efficacy that was direct experience, indirect experience, verbal persuasion, and emotional condition.

Conclusion: With the modification of the buzz group method and self efficacy for pregnant mother can increase of value for breastfeeding exclusive coverage.

Keywords: *Buzz Group Modification, Buzz Group Method, Self-Efficacy, Breastfeeding Self-Efficacy*

Introduction

Breast milk can help infants to start life well, the content in breast milk can meet all food needs such as nutrition and immunology. Giving exclusive breastfeeding for 6 months and continued with breastfeeding for 2 years can enhance spiritual (SQ) and emotional (EQ) abilities¹. Problems that cause mothers not to exclusively breastfeed are lack of knowledge about the breastfeeding benefits, proper breastfeeding, lack of lactation counseling services and support from health workers, socio-cultural perceptions against

breastfeeding, and lack of motivation to breastfeed. Psychological factors are one of the factors that influence one's level of confidence. Self efficacy is a person's belief to do a specific task or behavior².

Self-efficacy or self-confidence is one important factor in the success of giving exclusive breastfeeding. There was study examined that the lower the self-efficacy of a person, the lower the success rate. Until now there are still mothers who are worried that the production of breast milk is a little, thus, the reality that occurs mothers really experience disruptions in the production

of breastfeeding^{3,4}. Many ways have been done by the government to socialize exclusive breastfeeding, namely the formation of government regulation number 33 of 2012 concerning exclusive breastfeeding and various kinds of study on exclusive breastfeeding have been done, but until now Indonesia has not been able to achieve the target that was set by the government in 2010, namely coverage exclusive breastfeeding for infants aged 0-6 months is around 80%. This can be seen from the results of a health service survey in 2015, the coverage of exclusive breastfeeding in Indonesia from 0-6 months of infants was 55.7% with an increase of 3.4% from the previous year which was 52.3%^{5,6}. Self-efficacy for breastfeeding is an action that cannot be separated by the mother's belief in giving breastfeeding to her infant. There are various factors that make up self-efficacy such as direct experience, the experience of others, verbal persuasion, physical, and emotional state⁷.

Pucang Sewu Public Health Center is one of the public health centers in the Surabaya city area of Indonesia that has low breastfeeding coverage rates. Pucang Sewu public health center has a class of pregnant women which is held once a month. The number of pregnant women in attendance is not proportional to the number of pregnant women recorded in the public health center. This happens because of many factors, one of which is the absence of a companion during a class of pregnant women, the lack of motivation of mothers to come, and less varied learning methods. The use of the buzz group method is considered as appropriate way to eliminate these factors because this method has never been used during a class of pregnant women and considered as an update way of teaching material. The results of the study mentioned the role of the buzz group method in an effort to improve learning outcomes in fiqh material can be stated sufficient or moderate. Other study results revealed that there was an influence of the buzz group discussion method with the uno card game on student collaboration and the ability to solve student problems.

Based on this background the writers intended to provide a buzz group method modification in the class of pregnant women aimed at increasing the self-efficacy of pregnant women related to exclusive breastfeeding, hence it is expected that after giving birth mothers will exclusively give breast milk.

Method

This study used a quasi-experimental design. The independent variable in this study was the buzz group on the dependent variable, namely the self-efficacy of pregnant women in exclusive breastfeeding. Buzz group was a large group which was divided into several small groups, consisting of 4-5 people. An impromptu group consisting of no more than five people will make all group members actively involved in the discussion. The place was arranged so that participants can have their faces covered and exchange ideas easily. Buzz groups also assigned each large group member and group leader. The next stage, small groups gathered and discussed, then returned to the large group, which then conveyed ideas that arise in the group. At the end of the session, the facilitator asked each group to actively participate in delivering the results of the discussion. This method can build an atmosphere of mutual respect for differences of opinion and also increase the participation of participants who still did not talk much in broader discussions and can develop a common opinion or agreement to find a best formulation of an issue.

The population in this study was pregnant women in the working area of the Pucang Sewu Public Health Center. The population in this study was 42 pregnant women. Based on the formula, the minimum sample size used was 38 respondents. The 38 sample results were divided into 2 groups: 19 for the control group and 19 for the experimental group, with inclusion criteria: (1) Mothers can read, write and hear (2) Late trimester pregnant women recorded in the Pucang Sewu Puskesmas. Furthermore, the exclusion criteria are: (1) Pregnant women with chronic or infectious diseases (HIV, TB, cancer, hepatitis). (2) Pregnant women who did not have permanent residences.

The sampling used by writers was nonprobability sampling that was purposive sampling. Data collection instruments used in this study were in the form of informed consent, questionnaire sheets, stationery, booklets and turning sheets about exclusive breastfeeding, and respondents. The instrument in this study used the Breastfeeding Self Efficacy Scale Short Form (BSES-SF) containing 14 questions about confidence and confidence in breastfeeding. Each question has a 5-point Likert scale and summed. This instrument was compiled by Dennis in 2003 and has been declared valid and reliable⁸.

The data collected was analyzed the differences in self-efficacy changes before and after the intervention was given, such as buzz group method modification with the Wilcoxon Signed Rank Test. The Mann Whitney test was carried out to analyze the differences between the two

groups, the treatment group and the control group, with significance level $p \leq 0.05$ meaning that if the statistical test showed the value of $p \leq$ then H_1 is accepted. This study has been through a review and has been declared “Eligible Ethics” with a Certificate of Ethical Feasibility from the Faculty of Nursing, Universitas Airlangga, Surabaya Indonesia.

Results

Characteristics of Respondents

The following is the respondent’s characteristic data.

Discussion

The results examined that self-efficacy of the control group and the treatment group before getting the intervention got the same score that was moderate. Self-efficacy was a person's belief to do positive things, thus it affected motivation, thought processes, emotional conditions, and social environment that shows a habit. Self-efficacy for mothers was considered as important for breastfeeding activities and can provide an illustration, especially for health workers about mothers' readiness in providing nutrition with breast milk for their babies. The level of self-efficacy of a person in each task varies greatly. This arises due to factors that influence the perception of an individual's abilities such as gender, age, level of education and experience⁹.

Based on the results of the study, respondents with primary education have low to moderate self-efficacy, such as control group respondents number 10 who have low self-efficacy because mothers cannot read fluently and also lack of knowledge about breastfeeding. Control group respondent no. 1 and 2 were respondents with a high education level, namely tertiary institutions with high self-efficacy scores, this was due to the large amount of information that mothers have obtained from various books and internet sources. Individuals who have higher levels have higher self-efficacy, because basically they learnt more and receive more formal education, besides individuals who have higher education levels will get more opportunities to learn in overcoming problems¹⁰.

The number of children was one thing that influenced the practice of breastfeeding. Most respondents were mothers with more than one child. This will increase the experience of mothers in breastfeeding. The number of children influenced the mother's knowledge because the practice of nursing mothers was closely related to the learning process of the practice of the previous child. The results revealed that self-efficacy after intervention in the treatment and control groups were different. These results were reinforced by the post-test conducted 1 week after the intervention. This referred to a theory that explained that the effective time to carry out a post-test should be within a week after the intervention. The treatment group, which initially had an average level of self-efficacy after being intervened, became a high average, in contrast to the control group which had no significant changes after the intervention^{4,11}.

The experience of success or direct experience can increase the confidence and strong desire of the

respondent. A sense of success can also increase the persistence and persistence of respondents during the process, so as to reduce failure. Mothers who have direct breastfeeding experience tend to be more confident to continue breastfeeding. There were 6 respondents who gave non-exclusive breastfeeding to their children, and the six respondents had a moderate level of self-efficacy. There were 3 respondents who had successfully provided exclusive breastfeeding and the three people had high self-efficacy. The learning pyramid theory Edgar Dale explains that a person's learning outcomes were obtained by direct experience (concrete). Learning that referred to Edgar Dale's pyramid theory reinforced direct experience, through direct experience practice will provide information and ideas contained in that experience, because it involved the sense of sight, hearing, feeling, smell, and touch⁸.

Someone's self-efficacy can increase especially if she believes she can do the action because she sees that other people have succeeded in doing so. Individuals will have a tendency to increase motivation and confidence to take action if they see that those who have already been able to succeed through the problem. Small groups when implementing the buzz group modification get problems that were discussed in groups, this allowed for mothers who have experience in giving breastfeeding to tell the inexperienced, thus it can bring self-efficacy to inexperienced mothers^{3,12}.

Buzz group modification activities can encourage shy individuals to contribute thoughts to participate in discussions and create a pleasant atmosphere so that pregnant women can receive information with happy feelings^{12,13}. Respondents from the treatment group got an increase with high self-efficacy values, there was only 1 respondent did not experience it. This was because respondent number 10 was in a hurry to go home soon because her first child was sick. In terms of age, the respondent was 34 years old enough, in terms of the experience of the respondent she also has 2 children and now his third pregnancy, the first child was not exclusively breastfed because of work and the second child was exclusively breastfed, in terms of education.

The control group did not experience a significant increase in self efficacy about exclusive breastfeeding. The increase in self efficacy about exclusive breastfeeding in the control group only slightly increased, it happened because after the pre-test the control group followed the class of pregnant women who also coincided

with discussing the material of breast milk, namely understanding breastfeeding, understanding exclusive breastfeeding, and how to express milk. The activity was one form of verbal persuasion, where verbal persuasion was one source of self-efficacy. Another factor that made the increase in the control group was that the writers gave a handbook on pregnancy to respondents as souvenirs during the pre-test and every Monday and Thursday there was an examination of pregnant women, meaning that there were pregnant women who received additional information when attending examination. Therefore, after a post-test one week later there was still a shadow about breast milk making a slight increase in the control group.

Conclusion

Submitting material with a modification of the buzz group method was a powerful way to increase self-efficacy about exclusive breastfeeding to pregnant women, because at home pregnant women can re-study the material discussed.

Abstract

Objective: The cervical cancer is the most found cancer in the gynecological malignancy. Several cervical cancer cases sometimes are found the result of *Intravenous Pyelography* examination that is not suitable with the clinical stage that has been examined according to *Federation Internationale de Gynecologie et d'Obstetrique*. Another deviation that accompanies the cervical cancer cases is very important for clinicians and the patients because of the distinct deviation managements. The utilization of other modalities in supporting the other deviations needs to be considered so that the patient service will be better and more accurate as it is expected by the clinicians and the patients.

Aim: This study aims to identify comorbid abnormalities in cervical cancer patients undergoing *Intravenous Pyelography* examinations and clinical examinations according to FIGO.

Method: The retrospective research is applied from the medical records of the cervical cancer patients in stage IA IVB on January until December 2014 and it is analyzed statistically.

Result: From 131 samples, it is obtained 77 samples which are qualified the inclusion criteria. There are 48 samples (62,3%) which are resulted to normal IVP and 29 abnormal samples (37,7%). It is also revealed that there are comorbidity deviation in 14 patients (18,2%).

Conclusion: From the result of *intravenous pyelography* examination, it is found that several comorbidity deviations based on the result of BUN/creatinine and clinical examination of *Federation Internationale de Gynecologie et d'Obstetrique* should not be found any deviation. Regarding these results, the clinicians therefore can consider the next management for the patients.

Background of the Study

Cervical cancer is still the main health problem in the

world, ranks third most after breast cancer (1.38 million cases) and colorectal cancer (0.57 million cases), and is the fourth leading cause of death after breast cancer (458,000 deaths), lung cancer (427,000 deaths), and colorectal cancer (288,000 deaths) ¹. An estimated 740 cases of death occur due to cervical cancer ². Cervical cancer is a leading cause of death for women throughout the world ³. In ASEAN, the mortality rates of several countries that still have high cervical cancer rates include Cambodia, Myanmar and Laos ⁴. In Indonesia, cervical

cancer still occupies the first position, followed by breast cancer and skin cancer, while in gynecological cancer, cervical cancer is the most frequent cancer, followed by ovarian cancer, endometrial cancer, vulva and vagina.

According to FIGO, cervical cancer can spread into the parametrium, vagina, uterus and other surrounding organs ⁵. In some cases of cervical cancer that is found with a certain stage accompanied by concomitant diseases causing impairment of kidney function not in accordance with the clinical stage so that it will change the management of therapy in patients. For example cervical cancer with ureteral stones, cervical cancer with diabetic nephropathy or cancer with other disorders. These abnormalities can be detected by conducting an Intravenous Pyelography (IVP) examination. IVP examination is carried out as one of the investigations to detect various disorders of the urinary tract caused by infiltration from cervical cancer. Abnormalities in the urinary tract that are found after IVP examination still require another radiological examination to confirm the diagnosis.

Some studies suggest that the survival rate in cervical cancer patients who have comorbidities is low, although the mechanism is unknown ⁶. This study aims to identify comorbid abnormalities in cervical cancer patients undergoing Intravenous Pyelography examinations and clinical examinations according to FIGO.

Method

This study employed the retrospective and descriptive research and used the medical record as the secondary data. This study used the samples of the cervical cancer patients who were treated in the POSA Obsgyn RSUD Dr. Soetomo and the polyclinic of Obstetrics and Gynecology Graha Amerta Surabaya, who were also examined by the cervical cancer histopathology and creatinine serum and underwent the Intravenous Pyelography examination in the radiology section in the Centre Diagnosis Building and the Emergency Department in Dr. Soetomo General Hospital starting January 2014 until December 2014. The sample collection technique employed the total sampling method.

These are the research criteria:

Inclusion criteria:

- a. The cervical cancer patients stage IA-IVB
- b. The cervical cancer patients stage IA-IVB with

comorbidity diseases

- c. Have done the examination of cervical tumor tissue histopathology
- d. Have done the examination of creatinine and urea
- e. Have done the examination of *Intravenous Pyelography*

The exclusion criteria: patients who are and have been doing the chemo radiation

This study enrolled two variables research, which are the clinical stage that is written by clinicians based on FIGO as an independent variable, and the result of *Intravenous Pyelography* examination as dependent variable.

This study is started with the data collection that is taken from the IVP examination result and the clinical stages based on FIGO. All the records is submitted to be processed in the data tabulation and statistical analysis. The statistic assessment is processed with the SPSS software. Ethically, the researcher has given the ethical clearance permission from ethics commission of medical research of Dr. Soetomo general hospital.

The Result of the Study

In this study, it is found that there are 77 people but 54 people are excluded. The patients who were excluded are because 41 persons have not done the histopathology examination and 13 persons have done chemotherapy.

Table 1. Demographic data of respondents

	Frequency	Percentage (%)

IIIB	15	19.5
IVA	1	1.3
Cervical cancer stadium		
Early	42	54.5
Advanced	35	45.5

The Sample Distribution Based on Ages

In this study, the patients who are used as the research samples have the age range between 29 – 74 years old with the average age between 48.92 ± 8.07 years old. These are the data distributions based on ages: under 30 years old is 1 person (1,3 %); 31-40 years old are 8 persons (10,4%); 41- 50 years old are 41 people (53,2 %); 51-60 years old are 24 persons (31,2 %); 61-70 years old are 2 persons (2,6%); above 70 years old is 1 person (1,3%). However, the samples that are used are the patients between 41- 50 years old. The patient distributions that are used as the samples based on ages can be seen in Table 1.

The Profile of the Samples Based on the Disease Stages

Based on the result of data analysis, it is found that the cervical cancer patients stage IA are 8 persons (10,4%), stage IB are 20 persons (26 %), stage IIA are 14 persons (18,2 %), stage IIB are 18 people (23,4 %), stage IIIA is 1 person (1,3 %), stage IIIB are 15 persons (19,5%) and stage IVA is 1 person (1,3%). The most frequent cervical cancer patient is on their stage IB. The data distribution of the patients based on the stages can be seen in Table 1.

The cervical cancer stages can be distinguished into the early stage and advanced stage. The early stage consists of stage IA, IB and IIA whereas the advanced stage consists of stage IIA, IIIA, IIIB, IVA, and IVB. Based on the above criteria, the most frequent sample of the early stage cervical cancer are 42 persons (54,5 %) and the rest is the advanced stage cervical cancer patients that are 35 persons (45,4 %). The data distribution of patients based on the two stages can be seen in Table 1.

The Sample Profile Based on the Histopathology Conception

Based on the histopathology profile of cervical cancer patients that is used as the sample is the most frequent conception is Squamous cell carcinoma

which are 54 persons (70,1%). The conception of Adenocarcinoma histopathology in carcinoma cell are 17 persons (22,1%). The conception of combination histopathology is Adenosquamous carcinoma cell are 6 persons (7,8 %) (Table 2).

Table 2. The Sample Profile Based on the Histopathology Conception

Hispathology	Frequency	Percentage
Squamous cell carcinoma	54	70,1
Adeno cell carcinoma	17	22,1
Adenosquamous cell carcinoma	6	7,8
Total	77	100

The Sample Profile Based on the Intravenous Pyelography Examination Result

The data profile of the *intravenous pyelography* examination (IVP) result based on the normality of the histopathology conception is found that the most normal IVP examination results are 48 persons (62,3 %). The result of IVP examination that are not normal are 29 persons (37,7%).

On the other hand, the result that is obtained in the IVP profile based on the IVP result conception in detail stated if the most IVP examination result is normal that are 47 persons (61 %), while one person is indicated with bladder indentation. The results of IVP examination which are not normal with the hydronephrosis conception are 9 persons (11.7 %). The results of IVP examination that are not normal with the delay function conception are 5 persons (6.5 %). The results of IVP examination which are not normal with non-visualized conception are 4 persons (5.2 %).

The results of the abnormal IVP examination with bladder nuisance are 2 persons (2.6 %) The results of the abnormal IVP examination with the hydronephrosis and hydroureter are 3 persons (3.9 %). The abnormal result of IVP examination with hydronephrosis and non-visualized conception is 1 person (1.3 %). The abnormal result of the IVP examination with hydronephrosis, delay function, and hydroureter is 1 person (1.3 %).

The abnormal results of the IVP examination with hydronephrosis, delay function, and non-visualized conceptions are 2 persons (2.6 %). The abnormal result of

the IVP examination with hydronephrosis, hydroureter, and non-visualized is 1 person (1.3 %). The abnormal result of the IVO examination with the hydronephrosis, hydroureter conception and bladder nuisance is 1 person (1.3 %).

The Descriptive Analysis of the Relation among the Examination Results

Based on the data analysis, it is revealed that the result of IVP examination that is suitable with the clinical stages according to FIGO are 63 (81,8%), while those that are unsuitable are 14 (18,2%). The result of the descriptive analysis is suitable with the result of the IVP examination result with clinical stages of FIGO (Table 3).

32	IIA	Normal	Normal	-	Compatible
33	IIA	Normal	Normal	-	Compatible

Cont... Table 3. The Compatible Result of IVP Examination with the Clinical Stages Based on FIGO

34	IIA	Normal	Normal	-	Compatible
35	IIB	Normal	Normal	-	Compatible
36	IIIB	Normal	Hydronephrosis grade 2 + Hydroureter + Right non visualized	-	Compatible
37	IIIB	Normal	right Hydronephrosis grade 2	Multiple stone kidney,	Compatible
38	IIIB	Normal	Right non-visualized	-	Compatible
39	IIA	Normal	Normal	-	Compatible

In this study, it is found that there is an incompatibility between the IVP examinations compared to the clinical stages of FIGO. It happened because there is the comorbidity deviation so the IVP examination which must be on the early stage, it resulted in the normal IVP result. The examination of IVP with abnormal result on the early stage of cervical cancer in this study is caused by the emergence of comorbidity deviations such as: ureteral stone, uterine myomas, ovarian cystoma, Non Hodgkin Lymphoma, adenomyosis uteri, endometritis, Gastro-Intestinal stromal tumor, and bilateral ovarian cysts.

Discussion

The results of the IVP examination showed normal results in most samples. In detail, the results of the patient's IVP examination show compliance with the clinical stage based on FIGO. In the results of IVP examinations that are not in accordance with the clinical stage of FIGO, there are accompanying abnormalities as mentioned previously.

In general, the results of IVP examination in patients with early stage cervical cancer are normal, and will only show an abnormal picture at an advanced stage^{5,7}. The picture can be in the form of non-visualized, delay function, hydronephrosis, hydroureter or bladder disorders. There are two possibilities of abnormal but still appropriate stadium; and not normal but not according to stage if cervical cancer is accompanied by accompanying abnormalities.

Based on FIGO, IVP abnormalities can be found in advanced cervical cancer stage III and IV. This is because at that stage cancer cells begin to invade the lower third of the vagina and / or spread to the pelvic wall, and / or cause hydronephrosis or impaired kidney function. In stage IV, cancer cells spread beyond the pelvis or have invaded the bladder and rectum mucosa^{5,7}.

Accompanying disorders that are found based on IVP examination are abnormalities that should not be found on BUN / Creatinine examination and FIGO clinical stage including early stage cervical cancer (I-II)^{5,7}. With the discovery of comorbid disorders, clinicians are expected to be able to adjust the treatment regimen to these comorbidities. In addition, the use of IVP as an option for supporting examinations can be done if the facilities in the hospital are inadequate.

Conclusion

From the result of *intravenous pyelography* examination, it revealed that the comorbidity deviations are found in 14 patients (18,2 %). However, seeing the result of BUN/creatinine and clinical examination based on *Federation Internationale de Gynecologie et d'Obstetrique*, there must not be any abnormalities.

Conflict of Interest: The author reports no conflict of interest of this work.

Source of Funding: This study is done with individual funding.

Ethical Clearence: The research process involves participants in the survey using a questionnaire that was accordant with the ethical research principle based on the regulation of research ethic committee. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, non-maleficence, and justice.

Abstract

Background: Breast milk is the main food of infant in the sixth month of life. The behavior of exclusive breastfeeding in infants aged 0 - 6 months is still low. Variety of factors affected the behavior of breastfeeding. Based on Sunrise Model a lot of components affect health behaviors.

Objective: To analyze the factors behavior of breastfeeding based on Sunrise Model at Kenjeran Public Health Center

Method: The design used was cross sectional with total sampling method and 28 respondents. The independent variables were the kinship and social factors; cultural values and ways of life; niketutalitarmini@gmail.com economic factors, and educational factors. The dependent variable was the behavior of breastfeeding included exclusive, predominant and partial breastfeeding. Instruments used in the data collection were questionnaires. Data were analyzed using the Spearman test with the level of significance level was $\alpha < 0.05$.

Results: The results showed that kinship and social factors along with cultural values and ways of life were significantly related to breastfeeding behavior ($p_{\text{social}} = 0,000$, $p_{\text{cultural}} = 0,000$). Economic factors along with educational factors were not significantly related to breastfeeding behavior ($p_{\text{economic}} = 0.460$, $p_{\text{educational}} = 1,000$).

Conclusion: Kinship and social factors, cultural values and ways of life can improve the behavior of exclusive breastfeeding. Differences in economic and educational levels do not lead to differences in breastfeeding behavior. The results of this research can be used as the design of a model program of interventions on breastfeeding behavior in the community in further research.

Keywords: *Breastfeeding, Sunrise Model Approach*

Introduction

Breastfeed (ASI) is the baby's main food. WHO and UNICEF recommend exclusive breastfeeding be given to infants from birth to six months without additional food and drinks, except medicines and vitamins. Exclusive breastfeeding reduces infant mortality due to various common diseases affecting children and accelerates recovery when sick. Breastfeed has succeeded in preventing 1.4 million under-five deaths

in developing countries^{1,2}. Breastfeeding behavior and knowledge in maternal who have infants, especially exclusive breastfeeding, is still lacking. Many people still appreciate the beliefs, traditions, and culture that infants who are breastfed still need water and food other than breastfeed^{2,3}.

The Sunrise model was developed to provide a comprehensive and conceptual overview as an important factor for the theory of culture care diversity and universality. This model is a conceptual visual guide that illustrates several factors thought to influence cultural care⁴. There are various factors that can influence the behavior of breastfeeding, including mothers who give exclusive breastfeeding understand and receive

Corresponding author:

Ni Ketut Alit Armini

E-mail: niketutalitarmini@gmail.com

information about exclusive breastfeeding and the benefits of counseling given. Although there are some mothers who give exclusive breastfeeding, but there are still some other mothers who give breastfeed with additional food and drinks. This can happen for several reasons, including infants who only get breastfeed just look less full and fussy, mothers are tired after work, mothers are embarrassed to breastfeed in public, mothers are sick, breastfeed does not come out or a little^{5,6}.

Based on the Sunrise Model approach, this theory is important for health workers to realize cross-cultural knowledge and their needs. Culture is not just a way of life for someone but to connect someone with others, so they can know the needs or desires of that person. A person's cultural background needs to be studied in order to know beliefs about values and behavior in dealing with one another⁴. There are cultures that can support exclusive breastfeeding but there are also those that do not support exclusive breastfeeding. Family support is a supporting factor which, in principle, is an emotional and psychological activity given to breastfeeding mothers in breastfeeding. A positive mother's mind will stimulate muscle contraction around the alveoli glands to flow milk into the lactiferous ducts and then inhale by the baby⁷. In the Sunrise Model approach, there are several components that can influence health behavior. Based on the previous explanation, writers analyzed social factors and family attachments, cultural values and way of life, economic factors and educational factors in the Sunrise Model approach for further analysis in identifying behavioral factors in breastfeeding.

Method

This study used a cross sectional approach. The independent variables were social factors and family attachment, cultural values and ways of life, economic factors and educational factors and the dependent

variable is the behavior of breastfeeding including exclusive, predominant, and partial breastfeeding.

The target population in this study was breastfeeding mothers with infants aged 0-6 months in the work area of the public health center in Surabaya Indonesia as many as 90 people. The sampling technique used in this study was total sampling. Samples representing this study were 28 people with inclusive criteria: (1) Mothers who have children aged 0-6 months (2) Mothers who can read and write (3) Mothers who give breast milk. Furthermore, the exclusion criteria are: (1) At the time of the study, it was not in the area for a difficult period to determine (2) mothers with HIV/AIDS, hepatitis, and diseases that could be transmitted through breastfeeding.

Data collection instruments used in this study was questionnaires, namely a number of questions and written statements that were used to obtain demographic data, independent variables, and dependent variables. The instrument validity test was carried out with the SPSS 21 application with valid results on all questionnaires. The reliability test was performed using the Cronbach alpha method and declared reliable.

After the data was collected, the data was presented and analyzed by using Spearman's correlation statistical test to find out the relationship between the dependent and independent variables. The Spearman Test's significance level was determined $\alpha < 0.05$. This study has been through a review and has been declared "Eligible Ethics" with a Certificate of Ethical Feasibility from the Faculty of Nursing, Universitas Airlangga, Surabaya, Indonesia.

Discussion

The results showed that the behavior of breastfeeding included partial breastfeeding 53%, breastfeeding 3.6%, and exclusive breastfeeding 42.8%. According to WHO, the behavior of breastfeeding was categorized into 3, namely the behavior of exclusive breastfeeding, the giving of predominant and partial breastfeeding. Internal factors that influenced breastfeeding behavior included age, maternal knowledge, level of education, perception, psychological, maternal physical and emotional mother. Meanwhile, external factors that influenced breastfeeding behavior were the role of the husband, socio-cultural changes, mother's work, information by health workers, and lactation management in the delivery room (IMD practice). Other factors were maternal health which made it impossible to give breastfeeding^{2,8,9}.

The results examined that there was a statistically significant relationship between the factors of cultural value and way of life with breastfeeding behavior. This can be seen from the majority of mothers with a factor of cultural value and a healthy way of life that provides strong exclusive breastfeeding (85.7%). Mothers with weak cultural values and a healthy lifestyle gave 100% non-exclusive breastfeeding (Partial breastfeeding 92.3% and Predominant breastfeeding 7.7%).

The results of other studies indicated that there were cultures that can support exclusive breastfeeding but there were also those that did not support exclusive breastfeeding. Mothers who have strong cultural values and healthy ways of life and weak healthy ways of life tend to choose non-exclusive breastfeeding. There was one respondent whose factor of cultural value and way of life was strong that respondent 1 gave partial breastfeeding because the mother works. Many people did not know how to pump and store breastfeed, hence they chose to give formula milk during the day when they work^{10,11}.

The results showed that there was no statistically significant relationship between educational factors and economic factors of mothers with breastfeeding behavior. This can be seen from the data of mothers who gave exclusive breastfeeding as much as 42.8% of 28 respondents consisting of educated mothers (high, medium and low) as well as middle and lower economic levels. The Kenjeran Community Health Center has provided counseling about breastfeeding so getting information about ASI was not a problem. The level of education was one of the social aspects that generally

affected the level of family income as well as economic factors. In this case high knowledge, the effort to find information will be broader, because people who have a higher education base are easier to understand and understand the information they receive when compared to those with lower education^{1,12}. That means that mothers with high levels of education will produce good knowledge and from good knowledge will influence good behavior (exclusive breastfeeding behavior) such as respondents 11 and 19.

12 respondents with lower economic factors and lower secondary education factors provided non-exclusive breastfeeding. Low-educated mothers need information or information media about breastfeed that was easier to understand. This information must be conveyed in ordinary language through lay forums such as social gathering and PKK meetings. Respondents 7 with lower economic factors and low education factors exclusively breastfed. The higher per capita household income, the lower the exclusive breastfeeding, both in the group of infants aged 0-1 months, 2-3 months, and 4-5 months.

There was one respondent, 28 respondents who have secondary economic factors and secondary education factors but provide partial breastfeeding. In this respondent, social factors and family attachments were weak as well as cultural values and healthy ways of living are weak. Sunrise model stated that a health behavior was formed by various factors that work together. If there was an imbalance of factors such as the respondent number 28, the health behavior became less. That caused someone to be educated and have a good economic status, their health behavior was still lacking, whereas respondents 4 and 26 with higher education and middle economic factors gave partial breastfeeding because of work. Working mothers were actually not a reason to not give exclusive breastfeeding if they knew how to pump and store the right milk. Health workers should provide this information after the mother gives birth. In addition, the delivery of information was conveyed by her husband and family in order to support the mother in providing exclusive breastfeeding. Mothers with secondary economics and tertiary education should be more active in finding information about breastfeeding because they were better able to understand and easily access information¹³⁻¹⁵.

Conclusion

Social factors and family attachments as well as cultural values and ways of life enhance the behavior of exclusive breastfeeding. Furthermore, at the economic level and education level did not determine the behavior of breastfeeding.

Abstract

Aim: This study presented to compare the antimicrobial effect of MTAD, 17% EDTA, and 3% NaOCl, against *Enterococcus faecalis* (*E. faecalis*).

Methodology: The study utilized 40 extracted human primary teeth with single root canal. The samples were instrumented and sterilized, and then, these teeth were infected with *E. faecalis* for 2 weeks, after that tooth were divided randomly into 2 groups according to the irrigants used. All the samples were incubated in brain heart infusion (BHI) broth. Irrigation processes were completed according to each material instruction. The effectiveness of irrigants was evaluated by comparison between the pre-irrigation and post- irrigation samples using serial dilution (CFU/ml).

Statistical analysis was done using one-way anova with dunnett t3 post hoc test.

Results: all samples treated with MTAD showed nearly complete absence of bacteria. the samples treated 3% NaOCl and 17% EDTA showed similar result to the first group, Statistical analysis of the data using dunnett t3 test showed there is no significant difference between the groups ($P > 0.05$).

Conclusion: The study concluded that MTAD was effective as 3% NaOCl -17% EDTA against *E. faecalis*.

Keywords: BHI broth, *Enterococcus faecalis*, 17% EDTA, MTAD, 3% NaOCl, Primary teeth.

Introduction

Microorganisms are playing a fundamental role in etiology of pulp and periradicular lesions [1]. Successful therapy of root canal relies on triad of instrumentation, disinfection and obturation [2]. The major determinant in the healing of periapical tissues is the disinfection of the root canal [1]. This is happen though the use of antimicrobials and chemo mechanical preparation, which are effective in reducing the bacterial load, some bacteria can still persist [3]. One among the facultative organism

is *Enterococcus faecalis*, which is persistently found in failures of root canal treatment [4], and is resistant to various intracanal medicaments [5]. The microorganisms, which found in the root canals of permanent teeth are similar to those in the root canals of deciduous teeth [6, 7]. Though, a commonly used root canal irrigant, is sodium hypochlorite (NaOCl), it has an unpleasant taste and odor it does not consistently system for disinfect the root canal [8], and is toxic, when extruded into the periradicular tissues [9]. So, a search for better root canal irrigant continues, because of these limitations.

Figure 1: bile esculin blood agar plate.

Torbinejad in 2003 introduced, a new irrigant, such as MTAD which is a mixture of Doxycycline, citric acid, and detergent (Tween-80)^[7], which is capable of safely removing the smear layer^[10], and eliminating *E.faecalis*^[11]. The present study sought to compare the antimicrobial efficacy of MTAD, 3% NaOCl, and 17% EDTA against *E.faecalis*.

Methodology

Material and Method

Forty extracted single rooted of human primary teeth, were collected from children, aged 6-7 years, (Tow-third of the root length, at least should be presented). Crowns of teeth, were cut leaving only the roots. Determination of working length should be completed by radiograph. Instrumentation of the roots, to size 30 K-type file. Then cleaning the samples with normal saline, and sterilized by ^[12].

E.faecalis, should be isolated from infected root canals. Many samples were taken from chronic infected roots that suspected to be inhabitant with *E.faecalis*. there was a special test called bile esculin test (selective test for *E.faecalis*) used for first identification of bacteria (figure 1) where, such a black deposit appears after 24 hours of samples culturing (figure 2). Then *E.faecalis*, further detecting by another way called vitek2 system for more accuracy (figure 3).

Figure 2: E.faecalis (black deposit) in bile esculin agar

Figure 3: vitek 2 system

The tooth specimens sterilized and then inoculated with *E.faecalis* that, after that was cultured in Brain-Heart Infusion (BHI) broth at 37°C. In order to inject the broth suspension inside root canal, 30 gauge needle was used. All specimens tooth must be immersed in broth at 37°C to allow bacterial growth (figure 4). Medium in this process should be changed once a week for each 4 respectively weeks. Two weeks' period was chosen for inoculation of bacteria, as recognizable number of colonies of bacteria has been produced after it. After this process, teeth were removed from the bacterial culture. Then we covered the root apices with Cavit™. After that, the end of each tooth specimen was wiped with 3% sodium hypochlorite in order to disinfect the outside of the tooth before irrigation treatment ^[13].

Figure 4: teeth specimens in brain heart infusion broth.

Figure6: colonies of *E.faecalis* in the blood agar plate.

Then, all samples were divided randomly in to 2 groups, for experimental procedure of irrigation materials. Paper point that used for taking swap should be sterile, this swap from root canal (pre samples) before irrigation procedures. Importantly, we must be irrigated the root canal with normal saline and then preoperative swap was taken; normal saline here acts as good media for inoculation the content of canal.

Irrigation procedure:

Group 1: In this group, 20 roots samples, each root canal was irrigated firstly with 2ml 3% NaOCl, then normal saline cleaning, followed by irrigation with 17% EDTA, and final irrigation with normal saline^[14].

Group 2: In this group, 20 samples irrigated with MTAD, 2 ml of MTAD used for root canal irrigation, followed by irrigation with normal saline ^[15].

Sterile paper point, used for taking post irrigation samples from the root canal. Both pre and post sample, are kept in Eppendorf tubes, special tubes, which containing 1ml of normal saline, (figure 5) and then transferred to the laboratory, for serial dilution, and bacterial count by using cfu/ml procedure (figure6).

Figure 5: pre and post irrigation samples.

Figure6: colonies of *E.faecalis* in the blood agar plate.

Results

In this study the number of bacterial colonies in both irrigation regimens are reduction as in table (1).

Table 1: The values of antibacterial effect of the Tow irrigant methods used in the study

Groups	Mean	Std. Deviation	Minimum	Maximum
MTAD	98.037	1.029	95.45	100.00
NAOCL&EDTA	99.187	1.975	94.00	100.00

Result of one way anova revealed that there is no significant difference between antibacterial efficacy of both groups $p > 0.05$ shown in (table 2).

Table 2: Statistical values of one wayanova analysis for both Groups

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	5832.821	2	2916.410	240.724	.161
Within Groups	508.837	42	12.115		
Total	6341.658	44			

Levene statistics=17.993, df=2, p value=0.161.

Table 3: The antibacterial effect of the irrigant methods by Dunnett t3 post hoc test, Comparison Study.

Comparisons between groups using Dunnett T3					
(I) Group	(J) Group	Mean Difference (I-J)	Sig.	95% Confidence Interval	
				Lower Bound	Upper Bound
MTAD	NaOCL&EDTA	-1.151	.161 [NS]	-2.636	.335

There is no significant difference showed in comparisons between MTAD and 3% NaOCL – 17% EDTA group, the p value = 0.161 ($p > 0.05$).

Table 4: The antibacterial effect for pre and post samples for both groups

Groups	Paired Samples Statistics				T value	P value	Effect size
	PRE		Post				
	Mean	SD	Mean	SD			
MTAD	3.675	1.251	.067	.032	11.202	.000[HS]	2.892
NaOCL& EDTA	2.041	.626	.014	.034	12.394	.000[HS]	3.200

Df = 14

In this study, result showed the reduction in the means percentage of the post samples of bacterial colonies for both methods, as in table 4, but the large effect size is 2.892 in the MTAD group, and (3% NaOCL-17% EDTA) group is 3.200 effect size, as in table 4.

Discussion

In order to eliminate the bacteria and their products, and the substrate from the root canal system of teeth, doing root canal treatment^[16], so this process is the main aims for our study. In this process, the use of irrigation solution is essential to ensure bacterial elimination, and removal of organic tissue pieces^[17]. Maximum tissue dissolving effect on the necrotic tissues, when we have maximum anti-bacterial effect of irrigant, and the least toxic effect on the peripheral tissues are some important features of an ideal root canal irrigant^[18]. Primary teeth have the complex morphology, and the irregularity of the root canals, which of negatively affect the success of chemo-mechanical endodontic treatment^[19]. The most commonly employed root canal irrigant is sodium hypochlorite, till now^[20], the antimicrobial activity of NaOCl is by the release of hypochlorous acid (HOCl), oxidative action of this acid on sulfhydryl

groups of bacterial enzymes, by the action of (HOCl) will disrupted the metabolism of the microorganism^[20]. Sodium hypochlorite, it is an effective antibacterial agent, but NaOCl is toxic when extruded to the periradicular tissue^[18]. Many primary teeth needed treatment for root canal, permanent tooth follicles can be damaged by NaOCl during treatment, and also peripheral tissues and oral mucosa. Therefore, a new irrigants should be found, research for that must be continues. MTAD, new material introduced in 2003, it was subjected to various test procedures, in order to evaluate its efficacy, it was compared with various commonly used irrigants. The antimicrobial activity of both MTAD over 3% NaOCl seen in this study are in conformity with the findings of Shabahang, and Torabinejad's study^[11, 21].

The most important organism in this study was *E. faecalis*. Therefore, it was selected, because it is most commonly isolated in endodontic retreatment of apical periodontitis^[4], sodium hypochlorite^[20], potassium iodide^[22] or calcium hydroxide^[23] chemical material irrigants had been identified to have a resistant currently when used, and has been found to survive as a mono-infection in root canals^[2]. There is many previous in vitro studies, which have shown a high level of susceptibility

of *E. faecalis* to MTAD, this solution was diluted 200 times and still has the same efficacy of, while NaOCl loses its antibacterial activity against the *E. faecalis* beyond 32 times dilution^[11].

MTAD, its acting by removing the smear layer of bacteria with significantly less erosion of the dentinal tubules in comparison with EDTA(10). MTAD, when was evaluated for biocompatibility, it was prove to be less cytotoxic, and more safer than Eugenol, Ca(OH)₂ paste, 5.25% NaOCl, 3% H₂O₂, 0.12% Chlorhexidine gluconate^[24]. The antimicrobial effectiveness of MTAD, by anticollagenase activity of Doxycycline, which it causes low Ph and have ability to be released gradually over time^[10], also its action by citric acid was facilitated the removing the organic and inorganic substances. Surface tension of solution reduces on the dentinal tubule by Tween-80, therefore, allows Doxycycline to penetrated more deeper into the tubules. Capacity of MTAD to kill *E. faecalis* after a mere exposure of 5 minutes, which is one of the significant features of this material, making it useful in the clinical situation. However, this effect was not seen with NaOCl^[25]. Newberry et al. showed that MTAD killed most strains of *E. faecalis* when diluted 1:512 times and inhibited most strains of *E. faecalis* growth when diluted 1:8192 times^[26]. Thus MTAD has ideal properties for root canal irrigant. The results of the our study was identical to the findings of Portenier et al^[27], Ghoddsi et al^[28, 29], and Davis et al^[30], while studies done by Dunavant et al^[29], Baumgartner et al^[30], Krause et al^[31] are differences with these results. These differences in the results due to differences in our methodology and variance in strains tested, and the modification in our processing.

Conclusion

Conclusion based on the data of the present study, biopure MTAD has an effectiveness as 3%NaOCl- 17% EDTA. However, more in vitro and in vivo studies are important to prove the using of MTAD as good irrigant against *E. faecalis*.

Iron Oxide Nanoparticles Reduced Biofilm Formation and Detection of *lmb* Genes in *Streptococcus agalactiae* Isolated From Patients with Diabetes Mellitus

Sarween Omer Taha Rasul¹, Khadija Khalil Mustafa², Zirak Faqe Ahmed Abdulrahman³

¹PhD Student in Microbiology, Biology Department, Education College /Shaqlawa, Salahaddin University, Erbil-Iraq, ²Full Professor in Medical Bacteriology, ³Full Professor in Molecular Microbiology, Biology Department, Education College, Salahaddin University, Erbil- Iraq.

Abstract

Fifty eight isolates of *Streptococcus agalactiae* were obtained from wound and urine specimens among one hundred thirty six from patients with diabetes mellitus and identified through cultural, morphological, and biochemical examinations in addition to VITEK 2 Compact System. All of the isolates were tested regarding their sensitivity to 18 antibiotics and the results showed that all of the isolates were resist to clindamycin, and sensitive to teicoplanin. The current study was carried out to use two methods (i.e. microtiter biofilm and Congo red agar) so as to provide and extend insight into bacterial colonization and biofilm formation among diabetic patients. The two methods were compared and the results revealed that microtiter was the best method for biofilm detection, and two chemical materials (i.e. silver oxide, and iron oxide) were used as anti-biofilms for all isolates, one of the best concentration and kind of chemical materials was Iron oxide at 75 mg/ml for reducing biofilm formation. PCR system was employed in order to detect the virulence genes (i.e *lmb* gene), the results that 30(51.72%) were positive for *lmb* genes.

Keywords: Biofilm, Diabetes mellitus, Nanoparticles, *Streptococcus agalactiae*, Virulence genes

Introduction

The term diabetes commonly used by public refers to a series of metabolic disorders that involve increased levels of blood sugar for long periods of time, which are collectively labeled Diabetes mellitus (DM) ¹.

It is a widely accepted phenomenon that diabetic patients are more likely to develop bacterial infections ².

Proteases break the peptide bonds in protein chains through hydrolysis³. Microorganisms perform their hemolysis using a substance called hemolysin ⁴.

The VITEK 2 system has advanced the technology to the level where it can identify and perform Antibiotic Sensitivity Test (AST) on bacteria, once the initial inoculations are performed and brought to its standards⁵.

Microbial organisms have developed various mechanisms in order to survive against the stressful conditions of the environment. One of these defensive mechanisms is their capability of developing a layer of slimy bio-film, which can be defined as a self-secreted polysaccharide aggregate matrix attached to their surface in a certain direction ⁶.

The isolated bacteria colonies were grown on the polystyrene layer of the microtiter plates' flat bottomed wells ⁷.

The Congo Red Assay (CRA) is a simple qualitative test method that has the additional benefit of leaving the colonies open for further testing ⁸.

Forming antibiofilm through the use of nanoparticles like a silver oxide leads to a decrease in resistance within biofilm because silver oxide interferes with most bacterial cell structures and functions ⁹. Various chemical techniques like co-precipitation, hydrothermal, and laser pyrolysis have proposed synthesis of iron oxide

nanoparticles ¹⁰.

PCR products are usually analyzed within agarose gel electrophoresis, where the DNA products can be put into an order based on their size and electric charge ¹¹. Detection of the *lmb* genes using conventional PCR .

Materials and Method

Bacteriology

Fifty eight *S. agalactiae* isolates (urine and wound) were obtained from 136 diabetic mellitus patients were depending on cultural, morphological and biochemical tests in addition to Vitek 2 compact system. Sensitivity test kit for gram positive bacteria which included several antibiotics such as clindamycin , erythromycin , tetracycline , inducible clindamycin , vancomycine , ceftriaxine , cefotaxime , benzympenicillin , ampicillin , trimethoprim , linezolid , tigecycline , nitrofurantoin , moxifloxacin , ciprofloxacin , imipenem , levofloxacin , and teicoplanin and VITEK 2 Compact System were employed. Enzyme assays like protease test, and hemolysin, were used for all isolates, and biofilm formation was performed by two methods of the microtiter plate method and Congo red method.

In microtiter plate assay test, the strains are inoculated in 10 ml of LB broth for 18 hours at 37 °C. Then a mixture of 50 µl inoculum and 50 µl fresh of LB broth is placed in a microplate (96 cells), and left for incubation overnight, once again at 37 °C. The cells are then emptied and washed with PBS thoroughly. 100 µl of 1% crystal violet solution is then added to the cells, and the microplate is left to rest at room temperature for half an hour. The plate is then washed once again with PBS, then the cells are introduced 200 µl 95% ethyl alcohol each. Finally, 125 µl of this solution is collected from each cell to measure under 540 nm using a microplate reader ¹².

The Congo red stain was obtained from Research lab fine chem. Industries, India, and was prepared as a 0.8 g/200 ml distilled water solution. Appearance of black dry crystalline colonies on the CRA plates indicated biofilm production while the colonies of biofilm non-producer remained pink or red colored ¹³.

MIC of nanoparticles on DM isolates

Two nanoparticles were used as antibiofilm agents against *S. agalactiae* including silver oxide, and iron oxide. The MIC Ago-np on 58(42.64%) isolates were 100 µg/ml from varies concentration (25, 50, 100, and 150 µg/ml), Also the MIC Io-np on 58 (42.64%) isolates were 75 mg/ml among different concentration were used as (20, 35, 50, 75, and 100 mg/ml).

DNA extraction

To obtain a pure culture, all of the *S.agalactiae* strains were streaked twice on blood agar (Oxoid, UK), and the single colony was inoculated into a 50 ml flask containing 10 ml Luria Bertani (LB) broth made of 10 g(w/v) NaCl2 5g (w/v) yeast extract (Oxoid, the UK) and 1 L distilled water. The flasks were kept in the incubator shaking at 110 rpm for a night. Isolation of DNA from bacterial cells was performed by using Presto™ Mini gDNA bacterial kit.

The DNA were extracted from the bacteria that had grown in the pure culture.

PCR amplification

Following the instruction of the manufacture of the PCR primers (Gene work, Australia). The primer sets were utilized to promote the invasion of the damaged epithelium(*lmb*) gene codes for *lmb* (laminine-binding protein). (Table 1).

Table 1. Primer sets used for the detection of virulence genes in *Streptococcus agalactiae*

Putative function	Target gene	Primer Sequence (5-3)	Amplicon size (bp)	Annealing temp. (C)	Reference
Promotes invasion of the damaged epithelium	<i>lmb</i>	ACCGTCTGAAATGATGTGG GATTGACGTTGTCTTCTGC	572	54	Spellerberg <i>et al.</i> , (1999)

AccuPower PCR PreMix is the powerful technology and easy to perform DNA amplification. It contains DNA polymerase, dNTPs, a tracking dye and reaction buffer in a premixed format, freeze-dried into a pellet. Primer (1.3 µl) of each forward and reverse, (2.5µl) of DNA

template were added to AccuPower PCR tube then 20µl of distilled water added to AccuPower PCR tubes. After that lyophilized blue pellet dissolved by vortexing. PCR performed for samples, proceeds in the thermal cycler for 30 cycles as mentioned in table (2).

Table 2. PCR protocol and thermocycling conditions.

Gene name	Initial denaturation	Cycles	Denaturation	Annealing	Elongation	Final elongation
lmb	95°C/5min	30	94°C/1min	54°C/1min	72°C/2min	72°C/5min then 4°C→∞

The most common way to separate DNA molecules according to size is electrophoresis technique in agarose gel ¹⁴.

a. Agarose preparation

A 1.5% was made by adding 1.5 gm agarose to 1X TBE buffer. The agarose solution was boiled until all the agarose was dissolved in a microwave oven for 1 minutes and left to cool at 50°C then an appropriate comb was placed in a sealed mould, and agarose was poured into the mould. The gel was allowed to cool for at least 20 minutes before the seal and the comb was removed ¹⁴.

b. Preparation of sample

Before electrophoresis each well was loaded with 5µl of PCR product and 5 µl of ladder DNA marker (100bp) was loaded into the well flanking the samples.

Result

In current study 58 isolates of *S. agalactiae* were

obtained from 136 diabetic mellitus patients. According to the results of enzyme assay, it was observed that all isolates produced hemolysin about 100% except for the protease test which indicated a percentage of about 60%.

Fifty eight isolates of *S. agalactiae* were tested for their sensitivity and resistance to 18 antimicrobial agents by using VITEK 2 Compact System, which revealed that their resistance to the antibiotics varied. The results indicated that the highest percentages of resistance of the isolates were respectively related to clindamycin 58 (100%), erythromycin 42 (72.4%), tetracycline 40 (68.9%), inducible clindamycin Resistance 38 (65.5%), vancomycine 36 (62.0%), ceftriaxcine 34 (58.6%), Cefotaxime 30 (51.7%), Benzylpenicillin 27 (46.5%), Ampicillin 25(43.1%), trimethoprim 20 (34.4%), linezolid 15 (25.8%), tigecycline 13 (22.4%), nitrofurantoin 11 (18.9%), moxifloxacin 9 (15.5%), ciprofloxacin 6 (10.3%), imipenem 5 (8.6%), and levofloxacin 4 (6.8%), and all isolates were susceptible to teicoplanin (Table 3).

Table 3. Antibiotic susceptibility test and degree of resistance of all isolates

No. of antibiotics	Antimicrobial agent	Symbol	R	S	Percentage (%)
1	Clindamycin	Clind.	58	0	100%
2	Erythromycin	Eryth.	42	16	72.4%
3	Tetracycline	Tetra.	40	18	68.9%
4	Inducible clindamycin Resistance	I.C.R.	38	20	65.5%
5	Vancomycine	Vanc.	36	22	62.0%
6	Ceftriaxcine	Ceft.	34	24	58.6%

Biofilm was carried out for all isolates by two methods including microtiter plate method and Congo red method, and it was observed that microtiter plate method led to the highest level of biofilm formation of 53 (91.37%), and the least biofilm formation was related to the congo red agar method 25(43.10%). Moreover, (figure 1a) indicates the results of biofilm formation by using microtiter plate assay and the control without

bacteria isolate. While , figure (1b) presents the results of biofilm formation by Congo red method.

Two nanoparticles of iron oxide, and silver oxide were utilized to reduce biofilm formation from all of the isolates, and the results revealed that the Iron oxide nanoparticles lead to a reduction of 43(74.13%) in the biofilm formation, and silver oxide 35(60.34%) (figure 2).

control(red)

Fig. 2. Reducing biofilm formation using (a) Nanopartecles of Iron Oxide, and (b) Nanopartecles of Silver oxide.

The detection of virulence genes was performed by using PCR technique, which led to detection of *lmb* gene with product size 572bp. Indeed, the results of PCR found that the *lmb* genes (Figure 3) .

Discussion

Out of the 136 specimens obtained from the patients with diabetes mellitus, 58 isolates were diagnosed to be *S. agalactiae*, this results is similar with those reported by Farely¹⁵ who stated that *S. agalactiae* is more prevalent among diabetic patients and the increased number of *S. agalactiae* infections is associated with diabetes. Moreover, Batista and Ferreira¹⁶ also concluded that *S. agalactiae* is quite common among diabetic patients.

The results obtained from VITEK 2 Compact System and Gram positive Kit indicated that all obtained isolates of *S. agalactiae* were 100% resistant to clindamycin, this finding is in line with the reports of the studies conducted by wang *et al.*,¹⁷ who concluded that clindamycin resistance rate is extremely high among pregnant women, also Rawat *et al.*,¹⁸ reported that resistance to clindamycin is high among diabetic patients. However, it was also observed that other antibiotics were used for *S. agalactiae* isolates gave variable resistant, while teicoplanin was susceptible for all isolates. This results similar with the results reported by Barberis *et al.*,¹⁹.

The current results indicated that the highest and lowest amounts of biofilm production were respectively related to microtiter plate method (91.37%) and congo red agar method (51.72%). This finding was almost in line with those of the studies reported by Azeredo *et al.*,²⁰.

Fifty three (91.37%) isolates were biofilm producers by using microtiter plates assay, and this method was the better screening test for biofilm production than Congo red agar because it was easy to perform both qualitatively and quantitatively²¹. Also, Mathur *et al.*,¹² reported that the microtiter assay was an accurate and reproducible method than Congo red agar, and this method can serve as a reliable quantitative tool for determining biofilm formation by clinical isolates of microorganism²².

With regard to the effect of the studied nanoparticles on reduction of biofilm, our results found that the Iron oxide nanoparticles resulted in a decrease of 43 (74.13%) in biofilm formation, and also, silver oxide nanoparticles were found to reduce biofilm formation by 35 (60.34%). This finding is closed to results of Ueno *et al.*,²³.

The *lmb* gene (laminin binding protein) plays an important role in the adherence of *S. agalactiae* 30 (51.72%) isolates were found to contain the *lmb* gene in the present study. According to Spellerberg *et al.*,²⁴, the *lmb* gene was presenting the common serotypes of *S. agalactiae*.

Conclusion

In current work it was indicated that *S. agalactiae* was quite common among the patients with diabetes mellitus, which could be reduced through, iron, and silver oxide nanoparticles. Since *S. agalactiae* can lead to result in severe invasive diseases, diabetic patients and medical experts are recommended to utilize such nanoparticle in order to inhibit or reduce biofilm formation as a result of *S. agalactiae*.

Correlation of Nitric Oxide (NO) Sputum Level and Lung Physiology of Indoor Parking Attendant

Tati Sudiarti¹, Winariani¹

¹Department of Pulmonology and Respiration, Faculty of Medicine, Universitas Airlangga, Dr. Soetomo General Hospital, Surabaya 60285, Indonesia

Abstract

Background: Air contamination inside the building causes respiratory inflammation and increases NO sputum levels that cause changes in parking staffs' lung physiology.

Objective: To analyze the correlation between NO sputum level and lung physiology of indoor parking attendant.

Method: This research was conducted at the Toserba oceans in Tasikmalaya West Java, Indonesia with a sample of 40 people. Twenty indoor parking attendants as an exposed group and 20 administrative officers as a control group. Sputum NO and lung physiology were examined in both groups. The measurement of NO sputum level was using Griess method and lung physiology was by spirometry of brand of Fukuda.

Results: The mean of NO sputum level in the exposed group was 4689.75 ± 6778.452 and in the control group was 485.25 ± 307 , the mean of NO level was obtained a significant difference between exposed group and control group ($p = 0.009$). The results of lung physiology examination in both exposure and control group from % FEV1, % FEV1 / FVC showed significant differences ($p < 0.05$). While % FVC did not show a significant difference ($p > 0.05$). The result of the Pearson correlation test showed a strong positive correlation between NO sputum level and lung physiology of indoor parking attendant ($r = 0.461$ with $p < 0.041$).

Conclusion: There was a correlation between NO sputum level and lung physiology of indoor parking attendant.

Keywords: Indoor parking attendant, NO level, Lung function, Vehicle emission level

Introduction

The World Health Organization (WHO) estimates that urban air pollution contributes about 800,000 deaths each year and disability of around 4.6 million every year worldwide. The burden is uneven that about two-thirds of the deaths/years occur in developing countries in Asia¹.

In the 1990s, many epidemiological studies reported the adverse effects of air pollution on health². Environmental factors play an important role in the development of respiratory diseases. The presence of various particles and gases from vehicle emissions such as carbon dioxide, carbon monoxide, sulfur, benzene, lead, nitrogen dioxide and black smoke have a role in the pathogenesis of the respiratory disease. Toxic chemicals and non-combustible gases resulting from motor vehicle emissions might cause respiratory tract irritation. In the long run, exposure to pollutants possibility leads to the occurrence of diseases such as asthma and bronchitis as well as the occurrence of lung physiological changes³.

The results of research in several cities (Jakarta, Bandung, Semarang, and Surabaya) showed that motor

Email: winarianiwina@gmail.com

vehicles were the main source of air pollution. The problem of air pollution due to vehicle emissions has reached a worrying point, especially in big cities. Motor traffic is quite dense that could affect air quality, traffic density not only occur on the highway but also can occur in the parking lot due to increased motor vehicle users which ultimately affect the air quality in the parking lot ⁴.

Based on several studies, air pollution might affect respiratory distress through reactive oxygen species (ROS) pathways. ROS could lead to respiratory tract cell to damage by inducing apoptosis (cell programmed cell death) and cell necrosis that will enhance the proinflammatory cytokine mediator and some chemokines including tumor necrosis factor alpha (TNF- α) and interleukin-8 (IL-8). This process could ultimately lead to decreased lung physiology function ⁵, and plays an important role in various lung diseases, including asthma and chronic obstructive pulmonary disease (COPD) ⁶.

Nitric Oxide (NO) is a short-lived intercellular material that has been shown to be important in many biological functions including neurotransmission, defense systems, immune function, and inflammation. Pathophysiology of lung disease associated with NO. Previous research has shown that measurement of NO expiratory air concentration can represent non-invasive measurements of inflammation in the airways. In particular, NO expiratory air has been shown to be a marker associated with chronic cough symptoms, COPD, and asthma. Several studies have examined the effects of air pollution on subclinical inflammatory markers such as NO. In a longitudinal study in elementary school students aged 8-13 years found that exposure to black smoke, nitrogen dioxide (NO₂), and particles smaller than 10 μ m (PM₁₀) was associated with an increase in NO expiratory air. Pollutants are also associated with decreased peak expiratory currents and increased inflammatory markers in nasal lavage samples ⁶.

Based on some evidence that mention of NO plays an important role in respiratory tract physiology and become an indicator of inflammation. Previous research examined levels of NO sputum of asthma patients whose results were higher compared with controls ⁷. Normal NO value of sputum was 502 μ m / L with standard deviation 414 ⁸. The half-life of NO in the tissue is very short (about 1-5 seconds), the direct NO test is not easy to do so the examination was performed indirectly using

Griess reaction ⁹.

The parking attendant, especially those working in closed rooms (Indoor) that are not equipped or not functioning air ducts so the vehicle exhaust gas will accumulate in the parking space, consequently affect the respiratory system. In research conducted by Almaditya to the parking attendant, the obstruction was obtained 80% and restriction 85%. Based on the above background, this research will be examined about the correlation of NO sputum level with lung physique of an indoor parking attendant.

Method

The subjects of this research were indoor parking attendants and the Tasikmalaya Ocean General Store administration officers who fulfill the inclusion and exclusion criteria. The inclusion criteria consisted of ages 18 to 55 years, have worked at least 1 year, able and cooperative undergo the procedure of induction of sputum and examination of lung physiology. Exclusion criteria were subjects with a history of bronchial asthma, heart disease, diabetes mellitus, rheumatoid arthritis, pulmonary tuberculosis, lung tumors, Chronic Obstructive Pulmonary Disease, and pneumonia. Allergic rhinitis. Free from drugs that affect the levels of NO (antioxidant, vitamin C). Subjects who are willing to participate by fill out the informed consent sheet and sign it.

This research was conducted in the parking area of the indigenous seashores of Tasikmalaya oceans using cross-sectional design. The data were collected using questionnaires and physical examination, subject demographic factors (sex, age, height, weight, duration of work), thoracic photos, vehicle emission measurements, NO-induced sputum and lung physiology. Sputum was obtained by inhalation induction using 2 ml of NaCl solution 2 ml with ultrasonic nebulizer device until the solution was exhausted then subjects were told to cough sputum on the sterile pot which had been prepared. Sputum NO concentration using Sputum was centrifuged for 15 minutes at a rate of 3000 g, cell culture supernates obtained were included in an eppendorf tube and stored at -20°C.

The pulmonary physiological examination was performed at the agreed time with a portable spirometer device of Fukuda Sangyo ST 75 brand. The examination was performed three times and the highest result was taken as the data to be analyzed. The values recorded are

FVC, FEV1 and FEV1 / FVC ratios. The measurement of vehicle emissions was performed by Air Quality Measurement System (AQMS). Measurements were made for at least 1 hour then recorded in report form. Automated monitoring equipment (AQMS), this equipment continuously monitor ambient air quality and produce the data that could set as needed. Parameters measured by this tool were carbon monoxide (CO), O₃, PM₁₀, NO₂, and Sulfur dioxide (SO₂).

The collected data were processed using SPSS (SPSS, Inc., Chicago, IL) with $p < 0.05$. To analyze the correlation of NO sputum level with lung physiology used correlation statistic functioned to describe the relationship of NO content-induced sputum with indoor lung parking attendant physique. The test used was Pearson test and Spearman test.

Results

Characteristics of Respondents

Based on the length of the working period less than or equal to 10 years dominated by exposure group was 90.00% and in the control group was 65.00 %. Based on smoking status in this study was dominated by smoking habit. In the exposure group, it consisted of 16 people smoking and in the control group consisted of 12 people smoking. Based on the abnormalities of lung physiology in this study was obtained more abnormal obstruction in the exposure group by 50%. While in the control group was 10%. Restriction and mixed abnormalities were not obtained in both groups of both exposed and control groups. Viewed from the abnormalities of lung physiology, there was a significant difference between the exposed group and the control group ($p = 0.005$) (Table 1).

Table 1. Measurement data of research subjects

Characteristics	Exposed group (%) or Mean±SD	Control (%) or Mean±SD
Sex		
Male	20 (100.00)	17 (85.00)
Female	0 (0.00)	3 (15.00)
Job durations		
≤ 10 year	18 (90.00)	13 (65.00)
> 10 year	2 (10.00)	7 (35.00)
Habit		
Smoking	16 (80.00)	12 (60.00)
Un-smoking	4 (20.00)	8 (40.00)
Lung physiology abnormalities		
Normal	10 (50.00)	18 (90.00)
Obstruction	10 (50.00)	2 (10.00)
Age	39.50±12.20	33.95±9.25
Years of service	6.40±2.43	9.95±6.97
NO Level	4689.75±6778.45	485.25±307.08

In the exposure group, it was obtained the youngest age was 21 years and the oldest was 55 years, while the control group obtained the youngest age at the age of 20 years and the oldest age at the age of 53 years. Judging from age there was no significant difference between

the exposed group and the control group ($p = 0.113$). In the exposed group, the shortest working period was 3 years and the longest working period was 11 years, while in the control group, the shortest working period was the age of 2 years and the longest working period

of 28 years. The mean of the subjects was obtained a significant difference between the exposed group and the control group (p = 0.038; Table 1).

Comparison of Lung Physiology

The comparison of % FVC based on the smoking status of the exposed group was The mean FVC% of the non-smoking group was higher than the smoking group, but the t-test at % FVC has obtained a p-value of 0.262.

The comparison of % FEV1 based on the smoking status of the exposed group. The mean of % FEV1 group that was not smoking is higher than a smoking group but, the T-test at % FEV1 yielded p-value = 0.454. Comparison of % FEV1/FVC based on the smoking status of the exposed group. The mean FEV1/FVC% of the non-smoking group was higher than the smoking group, but, the t-test at % FEV1/FVC yielded a p-value of 0.944 (Table 2).

Table 2. Comparison of lung physiology based on smoking and group status

	Groups		P	Smoking status		P
	Exposed	Control		Non-smoking	Smoking	
%FVC	121.40±13.17	129.30±11.96	0.054	126.50±7.93	120.13±14.09	0.262
% FEV1	106.45±15.99	118.35±12.84	0.013	111.75±14.17	105.13±16.57	0.454
%FEV1/FVC	75.15±5.43	83.45±6.25	0.000	75.25±1.70	75.13±6.06	0.944

Discussion

The average age of subjects was 37.56 years, but no significant correlation was obtained between age and lung function impairment ¹⁰. Based on smoking status dominated by smoking habits. In the exposure group, it consisted of 16 people smoking and 4 people did not smoke, while in the control group consisted of 12 people smoking and 8 people did not smoke. This was in accordance with previous research consisting of 57 people who smoke and 46 people who do not smoke ¹⁰.

There were abnormal lung abnormalities in the exposure group by 50% and in the control group by 10%. The results of previous research have obtained the decreased vital capacity of lung parking attendant in closed parking with r = 0.518 ¹¹. This study was inconsistent with previous research that only obtained 7.9% of the subjects lung abnormalities and the rest of normal lung physiology ¹⁰. Based on the smoking status in this study, more obstruction abnormalities were obtained in the exposed group (50%). While restriction and mixed abnormalities were unfound in both study and exposure groups ¹².

The results of this study according to Regulation of Minister of Manpower and Transmigration No.Per.13 / MEN / X / 2011 About Threshold Value Physical and Chemical factors in the workplace and the public health

guidelines of the city of Illinois on indoor air quality parameters that do not meet the required quality standards are high levels of Sulfur Dioxide (SO₂) by 0.68 mg/Nm³ and PM₁₀ 0.05µg/Nm³ in the indoor parking lot ¹³. The result of measurement of vehicle emission level in the indoor parking lot in this study above the air quality standard. Sputum NO concentration can be used as a marker of inflammatory processes in the airways such as asthma ¹². Inflammatory processes can also be caused by pollutants such as vehicle emissions (CO, SO₂, NO₂, O₃, PM₁₀) being inhaled ¹³.

There was a decrease in both FEV1 in case group (3.1 L/sec) and FVC in case group (2.7 L/sec) than the control group (3.2 L / sec) ¹⁴. The changes in FEV1 and FVC were not related to prolonged exposure to pollutants from vehicles after they were correlated with age, height, and level of cigarette consumption ¹⁵.

Currently, there no research that has been done to find the correlation between NO sputum and lung physiology of indoor parking attendant. In this study obtained NO sputum indoor parking officer significantly higher level than administrative officers. The result of ratio measurement (% FEV1/FVC) of indoor parking officer significantly lower than the administrative officer. We obtain 50% obstruction in indoor parking attendant and 10% in administration officer. This indicates that the higher the NO sputum level, the lower the ratio (% FEV1/

FVC). The results were in accordance with the results of measurements of vehicle emission levels (SO₂) of 0.68 mg/Nm³ and PM₁₀ 0.05 µg/Nm³ in indoor parking above the quality standard causing irritation and inflammation of the respiratory tract, resulting in increased levels of NO sputum. Airway inflammation results in edema of the respiratory tract resulting in impaired pulmonary physiological disorders in the indoor parking attendant. Sputum NO level with APE value (Flow Peak Expiration) showed a decreasing trend so that the decrease of sputum NO concentration followed by an increase of APE value¹⁶. This means that the higher the NO sputum level, the lower the value of APE. In Osaka Japan, where there was a strong negative correlation between NO sputum level and airway obstruction (FEV₁/FVC ratio) with $r = -0.62$ and $p < 0.001$ ¹⁷.

The obstacle of this study was the time required to examine all research subjects. The check should take at least 1 hour for each sample. In addition, data collection conducted on working hours of research subjects resulted in each research subject must alternately be served on the field when his colleagues underwent examination in this study. These barriers complicate the process of collecting research data, but the efforts undertaken to deal with it considered able to overcome the problem so that the data collection process can run well.

Conclusion

There was a correlation between NO sputum level and lung physique of indoor parking officer in Tasikmalaya oceanfront of West Java Province.

Conflict of Interest: The author reports no conflict of interest of this work.

Source of Funding: This study is done with individual funding.

Ethical Clearence: The research process involves participants in the survey using a questionnaire that was accordant with the ethical research principle based on the regulation of research ethic committee. The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, non-maleficence, and justice.

Indications and Adverse Outcomes of Emergency Lower Segment Cesarean Section at 1st and 2nd Stages of Labor at Al-Elwiya Maternity Teaching Hospital

Wegar Akram¹, Thikra N. Abdulla ², Taghreed Mardan Abullah³

¹Lecturer, ²Ass. Pro. Department of Obs. & Gyn., Al-Kindy College of Medicine, Baghdad University,

³Specialist Obstetrics & Gyn., Abugraib General Hospital

Abstract

Background: globally that about 6.2 million unnecessary cesarean sections were done yearly. Oldest surgical operation and it is considered as one of the most commonly performed surgical operations. **Objective:** To assess the indications and adverse outcomes of emergency lower segment caesarean section at 1st and 2nd stages emergency Caesarean at Al-Elwiya maternity teaching hospital. **Patients and method:** A prospective cross sectional study conducted for 1 year duration in Al-Elwyia Teaching hospital in the period from the first of Jan. 2018 to the end of Dec. 2018, when 1229 of the women were enrolled. **Results:** A total of 1229 cesarean sections operations were done in the period of the study, 836 (68%) were 1st stage emergency Caesarean and 393(32%) were in 2nd stage. The most common indications of the caesarean section were the malposition (64.5%). Meconium aspiration Syndrome is the most common perinatal outcome (n=34).

Conclusion: The 2nd stage emergency Caesarean shows more maternal and neonatal complications in comparison with 1st stage

Keyword: lower segment caesarean section, maternal complication, neonatal complication, 1st and 2nd stage emergency Caesarean.

Introduction

It was estimated globally that about 6.2 million unnecessary cesarean sections (CS) were done yearly. ⁽¹⁾ The CS rate were found in about 19% in data included from 194 countries and it's associated with higher mortality rate in both maternal and neonate. ⁽²⁾ While in a study done in 159 countries revealed that the rate of maternal and neonatal mortality was more than 10%. ⁽³⁾

Among the primary caesarean deliveries the most common indication for an elective procedure is breech presentation and for an emergency procedure includes labor dystocia and 6 non- reassuring fetal heart rate tracings. ⁽⁴⁾

In 1985, the World Health Organization (WHO) proposed that, of all births, the percentage of caesarean

sections should be between 5 and 15%; a percentage lower than 5% would suggest a limitation in the performance of caesarean sections, while a higher percentage of caesarean sections would not represent additional benefits. ⁽⁵⁾

Currently there are two concerns: while emerging countries seek to implement actions that allow greater accessibility to this procedure, in more developed countries or in sectors of populations with better economic conditions there is a growing increase in the percentage of caesarean sections performed. Only in the United States of America (USA), in 2006 a historical record of caesarean sections was reached. In that year, the percentage of births by abdominal route was 31.1%, with an increase of 50% in the last decade. In emerging countries such as China, caesarean section represents a percentage close to 40% of births, similar to South Korea. Belizan and collaborators ⁽⁶⁾ reported that in Latin American countries there is a well-documented phenomenon, in which the rate of caesarean section in 12 of 19 countries examined exceeded the maximum

Corresponding author:

Dr. Wegar A. Hussain,

email: wegarakram123@yahoo.com

percentage recommended by the WHO.

There is a marked difference in the recommendations on the indication of cesarean section among the different associations of obstetricians: The American College of Gynecology and Obstetrics (ACOG) ⁽⁷⁾ states that “in the absence of significant information on the risks and benefits of cesarean section [if the doctor believes that cesarean section promotes the health and well-being of the patient and her fetus more than vaginal delivery is ethically justified to perform it]. “ In contrast, the International Federation of Gynecology and Obstetrics (FIGO) ⁽⁸⁾ state that “at present, there is not enough evidence without medical reasons of a net benefit to perform a cesarean section, so it is not ethically justified.”

Maternal Characteristics

Of the maternal conditions that determine the way of birth, the maternal age and the reduction in the number of desired children stand out. ⁽⁹⁾ Gestational age less than 38 weeks of gestation or greater than 40 weeks increases the probability of having a cesarean birth. ⁽¹⁰⁾ Births at gestational ages between 29 and 36 weeks have a probability close to 57% of occurrence by cesarean section, compared to 33% in births with a gestational age between 37 and 42 weeks. ⁽¹¹⁾ Primi women have a higher proportion of cesarean deliveries (43.3%) compared to women who have a previous child’s history (34.9%), or two or more children (27.5%).

Among women of medium and high socioeconomic status there is a great preference for surgical delivery, ⁽¹²⁾ having determined that there is a relationship between socioeconomic indicators and the number of cesarean sections. ⁽¹³⁾

Another maternal factor is the fear of labor pain, as it has been described that up to a quarter of women prefer a cesarean section after having a vaginal delivery. ⁽¹⁴⁾

Obstetric Practice

Obstetricians of the female gender are those who perform a greater number of cesarean sections. In this regard, it has been estimated that there is a 12% higher probability that a woman will perform a cesarean than a man. ⁽¹⁵⁾

Social Factors

The behavior of human beings, the cultural

environment and beliefs are associated with the preference of cesarean births, although it is currently unknown how this preference affects. ⁽¹⁶⁾

Institutional Factors

In private hospitals it is more frequent to perform cesarean sections than in public institutions. ⁽¹⁷⁾

Economic Factors

The economic variables have to be taken into consideration. Multiple studies have been conducted to evaluate the cost and cost benefit of performing cesarean sections. ⁽¹⁸⁾

Aim of the study

To assess the Indications and adverse outcomes of emergency lower segment cesarean section at 1st and 2nd stages of emergency Caesarean at Al-Elwiya maternity teaching hospital.

Patients and method:

A prospective cross sectional study conducted for 1 year duration in Al-Elwyia Teaching hospital in the period from the first of Jan. 2018 to the end of Dec. 2018, when 1229 of the women were enrolled. Information was obtained from theater room and from gynecological and obstetrical labor ward records. The patients were evaluated separately on designed performed.

Inclusion criteria: All primi and multiparous women (with term pregnancy) in active labor (with cervical dilation) with cephalic presentation were included.

Exclusion criteria:

1. All delivering women with previous scar
2. Patients with history of medical disorders (HT, DM, thyroid,etc)
3. Mal-presentation
4. Twin and other high order pregnancy
5. Preterm labor
6. Congenital anomalies

Results

A total of 1229 CS operation were done in the period

of the study, 836 (68%) were in 1st stage of labor and 393(32%) were in 2nd stage emergency Caesarean (figure 1).

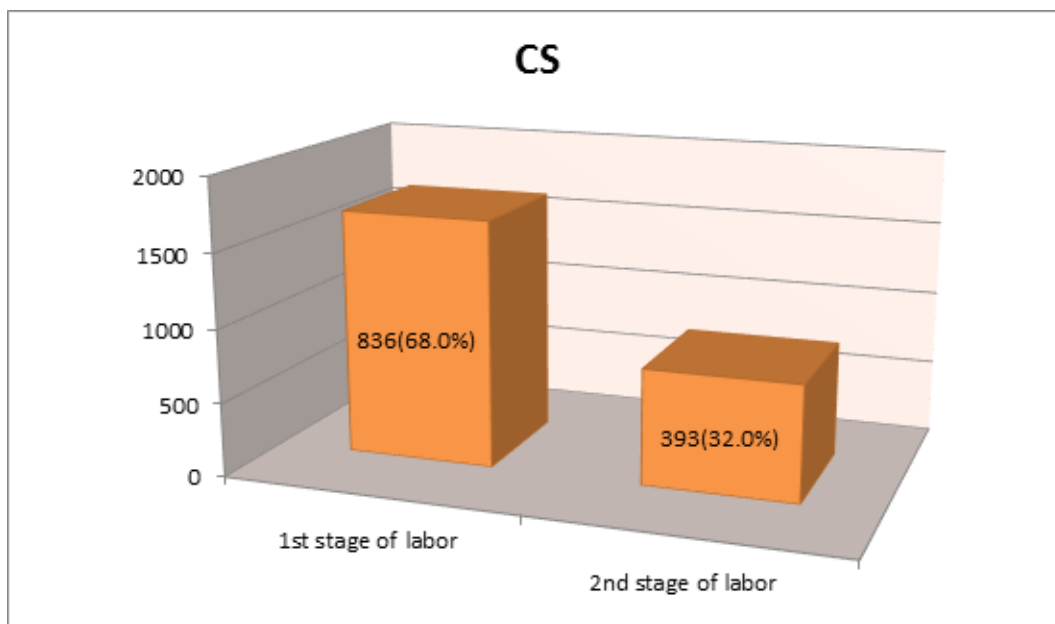

Figure 1: Distribution of CS in the studied group

As shown in table 1 the most common indications of the caesarean section were the malpresentation (64.5%), then fetal distress (20.8%), (10.7%) were failure to progress of labor, (4.4%) were APH and then cervical dystocia (3.9%).

	No.	%
Fetal distress	256	20.8
Mal position	739	64.5
Failure to progress of labor	132	10.7
Cervical dystocia	48	3.9
APH (abruption) at time of labor	54	4.4
Total	1229	100.0

Table 2, revealed that 74 patients have intraoperative complications, (48) of them were haemorrhage 13 patients with bladder injury, 10 were represent with extension of uterine and only 3 patients with caesarean hysterectomy complication.

The postoperative maternal complications of the studied patients were found in 466 (37.9%). The most common complications was UTI 183 (39.3%), then spinal headache which is found in 157/466, chest infection in 56/466, wound infection in 39 and 31 were in pelvic and genital infection. The 2nd stages were having more complications than 1st stage did.

Table 2: Intraoperative and postoperative maternal complications

Intraoperative maternal complications						
	2nd stage		1st stage		Total(n=184)	
	No.	%	No.	%	No.	%
Haemorrhage	31	66.0	17	34.0	48	100.0
Bladder injury	8	61.5	5	38.5	13	100.0
Caesarean hysterectomy	2	66.7	1	33.3	3	100.0
Extension of uterine Incision/tear	7	70.0	3	30.0	10	100.0
Total	48		26		74	
Postoperative maternal complications						
	2nd stage		1st stage		Total (n=466)	
	No.					
Spinal headache	89	56.7	68	43.3	157	100.0
UTI	102	55.7	81	44.3	183	100.0
Chest infection	33	58.9	23	41.1	56	100.0
Wound infection	23	59.0	16	41.0	39	100.0
Pelvic and genital infection	18	58.1	13	41.9	31	100.0
Total	265		201		466	

MAS is the most common perinatal outcome (n=34), then birth asphyxia, perinatal death (n=12), prematurity (n=10), difficulty in delivering the fetus breech (n=7) and INCU (n=17). The 2nd stages of labor have more complications than 1st stage (table 3).

Table 3: Perinatal outcome

	1st stage (n=40)		2nd stage (73)		Total	
	N.	%	N.	%	N.	%
Birth asphyxia	12	36.4	31	53.6	33	100.0
MAS	11	32.4	23	67.6	34	100.0
Prematurity	7	70	3	30	10	100.0
Difficulty in delivering the fetus	2		5		7	100.0
INCUB admission	7	41.2	10	58.8	17	100.0
Neonatal death	1	50.0	1	50.0	2	100.0

MAS= Meconium aspiration Syndrome

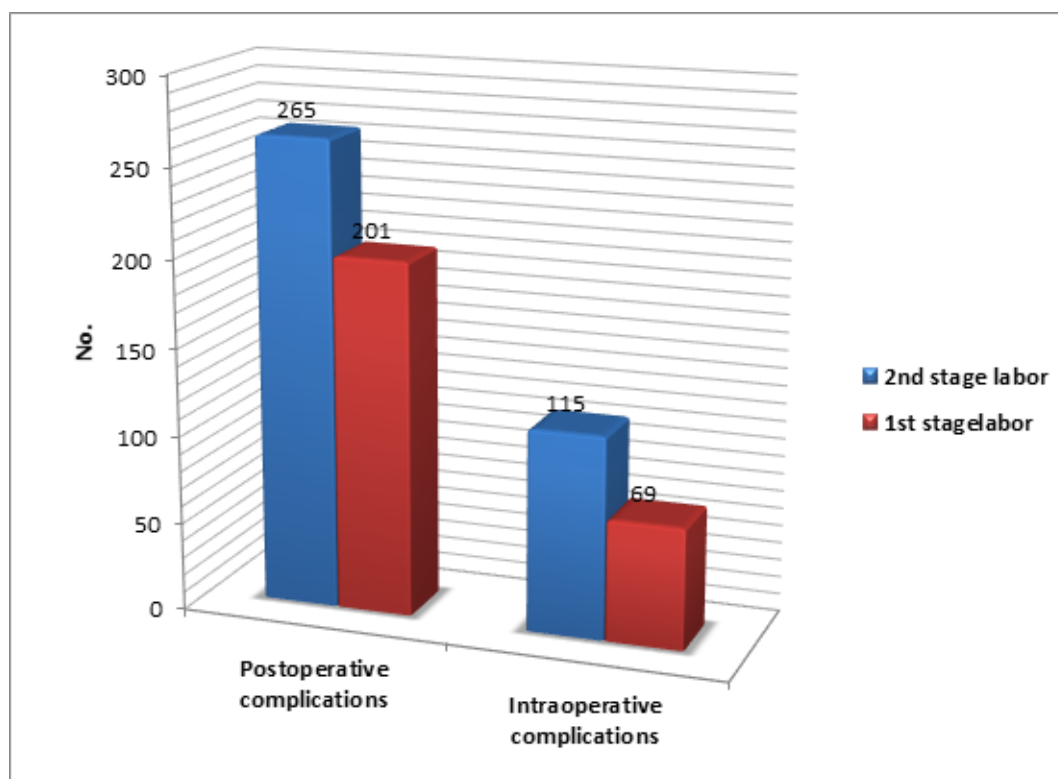

Figure 2: post & intra operative complications in both stages of labor

Discussion

In the present study the most common maternal indications for CS operation were mal position (64.5%), then fetal distress (20.8%), which is in agreement with that mentioned by Gulfareen H et al⁽¹⁹⁾ when reported that female in Pakistan show that the most common indications for CS in addition to repeated CS the labor dystocia, fetal distress, APH.

While in Mussarat N et al,⁽²⁰⁾ the most important maternal Caesarean section indications were previous one (34%), then (6%) severe preeclampsia, and (6%) for post-date& failed labor induction, this may be due to difference in antenatal care provided.

There is increase in the prevalence in 2nd stage CS which associated significantly with long term maternal physical and psychological morbidity. This problem significantly needs good skill and knowledge to decrease the possible adverse events. It's probable to stay as a regular problem for obstetricians in the estimative future with continuing burdens to decrease elective CS rates.⁽²¹⁾

Moreover it is similar to that found by Rabiou et al,⁽²²⁾ when mentioned that there is a higher blood loss, caesarean hysterectomy, wound infection in women

performed CS in the 2nd stage of labor in comparison with the 1st stage. Also same that found by Bashir A et al study.⁽²³⁾

The present study revealed that CS in 2nd stage labor operation was particularly the risk for neonatal birth asphyxia; this neonatal outcome was debatable in earlier studies. Which is not similar to Alexander JM⁽²⁴⁾ and Selo- Ojeme et al.⁽²⁵⁾ found no difference in the risk of fetal asphyxia.

Conclusion

The 2nd stage of labor shows more maternal and neonatal complications in comparison with 1st stage.

Conflict of Interest: No

The Determinants of the Occupational Diseases in Al-Nasiriyah Province at 2018

Majeed MohanThajeel Al-Hamami¹, Mulim Nahi², Ali A. Saadoon², Safaa Kudhaier Abbas³

¹Department of Internal Medicine, College of medicine / University of Thi- Qar, Iraq, ²Department of Family and Community Medicine, College of medicine / University of Thi- Qar, Iraq, ³Health Decorticate of Thi-Qar, Iraq

Abstract

Background: The occupational diseases are the major epidemic problem in the field of public health in developing countries (WHO). It does not arise haphazardly among the workers, but happens only when an appropriate accumulation of determinants or risk factors. .

The Aims of the study were to assess the general workers' health. and to explore the determinants) risk factors and causes (of the occupational disease within selected fields of work in Al-Nasiriyah province at 2018.

Method and material: An analytical cross-sectional study was conducted in Al Nasiriyah thermal electrical plant, cable plant and oil refinery in the Al Nasiriyah -province at 2018. A multistage cluster sampling method was conducted to recruit 369 (workers. The data gathered by survey questionnaire and processed by statistical analysis.

Result: The extent of occupational exposure was about 89.7% with exposed to the non-exposed ratio) 8.7:1 (. About 31.8 % of the workers exposed to the respiratory hazards (thinner, PVF, PVC, Ammonia and acoustic agents). About exposed cases with RADS (41 cases) had about 0.000 (P. value. The Noise exposure had 71.5 %)264(. of the workers The exposed cases with NIHL (23 cases) had about 0.015(. P. value. An odds ratio of the occupationally exposed to the non-exposed worker was equal to 19.1. Binary Logistic Regression was done to adjust the confounder factors for systematically classified occupational diseases which augments the significance of the association for occupational exposure, age and work duration.

Recommendations: Introducing the speciality of the occupational physician in primary health care with preparing for the establishment of the Thi-Qar occupational medical centre to promote the optimal occupational medical care.

Keywords: Determinants, Occupational diseases, Occupational exposure, Injury, Al-Nasiriyah.

Introduction

Work may have an annoying or hazardous exposure. [1,2] Each occupation has its hazard which is the potential harm workplace substances [3,4] These are including chemical, physical, biological and ergonomic hazards [5,6] The risk for the occupational disease and work related disease was covered by two aspects **First:** General risk for the chronic and workplace-related diseases. [7] **Second:** Specific risk for occupational diseases. The dose, frequency and duration of the occupational exposure determine the extent of the work-related and occupational diseases [8] This trigger a workplace health risk by acute and chronic (accumulated) effects

which lead to the emergence of occupational diseases [9] for example, Asbestosis from the asbestos exposure. Currently occupational health services coverage account about 24.8% only of the workers worldwide including the Health surveillance, occupational risk prevention, first aid, advising and training programs in workplace safety. [10] The negative influences of the workplace environment on worker health can be summarized in the form of the exacerbation of current illnesses, certain occupational diseases causality, undesirable influences on productivity. [11] The workers have In AL Nasiriyah City and as an inductive look for the medical occupational reality, some points could have been

being formulated: 1) There is no available in integral, considerations about the nature, extent and It was planned to highlight occupational diseases in the three locally effective, vital, hazardous with 24 hours task and richly in manpower enterprises. These are including: **Electrical generation** employees operate in the risky workplace and exposure to live power, magnetic field, Chemical exhaust hard official duties in the potentially hazardous workplace^[12] National Institute for Occupational Health NIOH and WHO 19,^[13] are building a Global Plan of Action on Workers' Health **GPAWH** which involve

1. Notifying and Registry of occupational risk factors and diseases and
2. Estimating capacities for the occupational burden of diseases.
3. Diagnosis improvement.
4. And categorized it as preventable diseases.

Hazard identification and risk assessments were needing to be identified^[9] Preventive measures have other important entity to eliminate or reduce the emerging of the occupational diseases.^[14] Occupational health and occupational hygiene have an overlapped role in risk assessment^[15] ILO recommended that there is a causal relationship with a specific exposure or work process in a specific work environment concerned with an epidemiological determinants and frequency which exceeds within the rest of the population.^[16] In Iraq and other developing countries, the rate of the occupational illnesses and accidents are assumed to be greater than that in developed countries. However, the described rates in these countries are much lower than the existent number^[17] determinants of the work and work-related disease in Al Nasiriyah industrial institutes. 2) The poverty of the medical occupational services. and physical waste to can lead to serious illnesses, injury or death^[18] It is worth noting that petroleum refining and distribution perceived to be respiratory, MSK, CNS hazardous effects where complex hydrocarbon compounds are separated and conversion.^[19]

Cable industry dealing with adversely health impact compounds include (lead, cadmium, halogenated flame-retardants.^[20] Also, **Aluminium industry** has a toxic effect on the respiratory tract as pulmonary fibrosis, asthma and chronic bronchitis with acute related symptoms were significantly more prevalent among the

aluminium exposed worker^[21].

By academic standpoint, it is necessary to conduct an observational descriptive analytical study to be a step in the way of answering the questions of this problem. There are many labour enterprises in this city. The largest and most vital institutes are selected to be as a paradigm of the accessible institutionalized population. To investigate a snapshot study about the extent and determinants of the work and workplace- related diseases. These enterprises are:

- UR State Company
- **Al-Nasiriya Thermal Power Station.**
- **Thi- Qar Oil Refinery. Preventive occupational measures**

Primary prevention is achieved by the methods of exposure reduction of hazardous substances to decrease the risk of disease.

Secondary prevention This involves the occupational disease surveillance achieved by recognising diseases before they become symptomatic.^[22]

Tertiary Prevention: This achieves by limiting the discomfort or symptoms, reduce body injury to the and boost the operational capacity.^[23]

Methodology

Profile of Study Area

- **Al-Nasiriya city** The study was conducted in Al- Nasiriyah city - the capital of Thi-Qar governorate- which is the 4th most inhabited city in Iraq^[15]. It is located along the lines of the Euphrates River, about)**370 km**(southeast of Baghdad, close to an ancient city of Ur. According to the Iraqi central statistic organization, there is about)**2,040,126**(calculated population in **2014**^[16]. Al Nasiriya City population estimated in **2017**)**793472** individuals(by Thi-Qar Statistics Directorate with a male to female ratio 1: 1 approxemaitly^[17].

- **UR State Company.** Ur Company is one of the companies of the Ministry of Industry and Minerals of Iraq It is located in the southeast of Nasiriyah city. The company was established in **1988**. Specializes in the production of all types of cables, electrical and telephone wires in addition to aluminium products. It includes 17 organizational unit contain about (**3108**)workers.^[24]

- **Al-Nasiriya Thermal Power Station.** It is one of the formations of the Iraqi Ministry of Electricity. It had been founded in 1979. The plant consists of four generating units. The first and second units produce 350 MW while the third produces 175 MW after completion of maintenance and the fourth 165 MW. The station operates a hot steam system to move the giant turbines. It is located on the right bank of the Euphrates in the west AL- Nasiriyah. It has more than **1,600** members working in the alternating system^[25]

Thi- Qar Oil Refinery One of the formations of the Ministry of Oil, South Refineries Company located south of the AL- Nasiriyah city of. It is receiving a crude oil for refining and contains several units for the separation, isolation and storage of oil products .it contain about**1337**(workers^[24]

Population of study: Field and office employees in the enterprises of the interest who responded to participate in the study. About **6200**(of the candidate employees were involved and identify in the sampling frame. **Study Design:** An analytical cross-sectional study for exploring the extent occupational diseases which was conducted in Al Nasiriyah thermal electrical plant, cable plant and oil refinery in the - City from the 1st of November 2017 to the 1st of the November 2018 .

Sample size: HSE statistics report)2017)^[18,19] for various work-related ill health was accredited and the highest prevalence rate **40%**(was obtained for extracting the sample size according to the Dobson’s formula^[20] to recruit **369**(workers.

Data Analysis carried out by SPSS version **25**^[21]

Table 1 Occupational exposure Distribution According to the demographic information of the workers in AL –Nasiriyah Province at 2018

Exposed		Occupational Exposure					
		Non- Exp.		Total			
Age	18 - 30 years	46	13.9%	3	7.9%	49	13.3%
	31 -40 years	66	19.9%	6	15.8%	72	19.5%
	41 - 50 years	150	45.3%	22	57.9%	172	46.6%
	51 - 60 years	58	17.5%	6	15.8%	64	17.4%
	More than 60 years	11	3.4%	1	2.6%	12	3.2%
Sex	Male	295	89.1%	13	34.3%	308	83.4%
	Female	36	10.9%	25	65.7%	61	16.6%

Results

Total extent of the occupational exposure was 89.7%of the workers with exposed to non- exposed ratio about 8.7:1. The highest extent of the occupational exposure was 98.8% within (18-30 years) age group. Males and female>s percentages of occupational exposure were 89.1% and 10.9% respectively with. The married accounted for the highest extent 92.4% of the exposed workers

Occupational respiratory risk factors Respiratory irritant chemicals consisted of (thinner, PVF, PVC, Ammonia and acoustic agents had a percentage of 31.8 % of the totals)118(. Exposed with RADS had P. value)0.000(with the 32.206) Fisher Exact test value41).Figure 1.

Occupational hearing loss risk factors

The Noise exposure had a percentage of 71.5 % of the totals)264(. The diseased workers with NIHL were accounting 5.1%)19 cases(of the total and non-diseased were accounting for 94.9% (350 cases). Exposed cases with NIHL)23(had a P. value)0.015(with the 10.173) Fisher Exact test value. Figure2. Noise percentage was the highest frequency among the occupational exposure with 71.5 %)264(workers. Most of them presented with a daily pattern of frequency one or two times per day. Ammonia and the acoustic agent had about)22.8%(exposure percentage with)84(workers for both with only daily frequency. The lesser exposure percentage was for the welding fumes and dust with 1.9 %and 1.1% respectively. Table 2.

Discussion

The highly extent)89.7%(of the occupational exposure implies poor local health protective strategy ^[7] with more expected adverse accumulative effect among 45.3% of the)41-50 ys(age group of the sampled workers by this study. The hazards exposure passing through a latent period of years to emerge the related disease symptoms ^[31], this study cannot be evaluated it due to the)cross- sectional(design.

Occupational respiratory risk factors

There is a very highly significant statistical correlation)P. value 0.000(between the respiratory

irritant exposure with RADS that pushed toward reject the null hypotheses with positive relation by)32.206(Fisher Exact. There is low petroleum-derived hydrocarbons associated with RADS and Nasal symptoms by the study of)Sekkal, Samira, Haddam, Nahida, Scheers, Hans, Poels, Katrien L, Bouhacina, Linda, Nawrot, Tim S, Veulemans, Hendrik A, Taleb, Abdesselam, Nemery, Benoit 2014(^[32]

Occupational hearing loss risk factors

About 5.1%)19(cases of the partial reducing hearing ability who diagnosed by otolaryngologist diagnosis via the audiogram. About)16(cases of them had their chronic occupational noise exposure with highly significant

statistical association P . value (0.015) that rejects the null hypotheses with a strong positive relation (Fisher Exact 10.173. About 42% of the workers with the noise exposure, all of those with the more than 10 years noise exposure were presenting with NIHL by Feder, Katya, Michaud, David, McNamee, James (while in this study, about 66% of the workers with the noise exposure, only 9 % of them of the more than 10 years noise exposure were presenting with NIHL The highly noise exposure 89.7% of the sampled workers implies hazards impact increasing with poverty of ear protective strategy. Noise has adverse hearing psychological cardiac and vascular impacts.^[32]

Recommendations

1. Introducing the speciality of the occupational doctor in primary health maintenance by the highest governmental authority on health maintenance.

2. Requesting from the medical committees in Thi Qar Governorate Council of Nasiriyah for the establishment of the occupational medical Centre to promote the optimal occupational medical care.

3. Providing of the essential medical care for the local workforces by activating of work fitness strategy through preplacement medical examination or periodic examination during employment and after injury or direct from sick leave.

³Senior Lecturer-Nusa Cendana University

Abstract

Background: Women are the main actors in reducing infant mortality. **Objective:** To develop suitable models of woman's participation to support government policy reducing infant mortality in Kupang District. **Methods:** qualitative method was used and 14 informants and 3 triangulations were selected by purposive sampling technique, followed by snowball sampling. Interviewers consists of 5 midwives, 5 cadres, and 3 chiefs of the village. **Findings:** The degree of women's participations in this study were low. Forms of participations showed that one Timorese has been given birth at home. Most of the East Timorese informants late reported their pregnancy, gave the porridge sun for babies after 6 months. TIHERO model of woman participation has been created in this study. **Recommendation:** It is expected that Government to open childbirth education class and model of women participation must be conduct in terms of reducing neonatal and infant mortality rate.

Keywords: *Women, Policy, Participation, Neonatal and infant mortality*

Introduction

Neonatal, infant and child mortality rate remain the third target of the second goal of the Sustain Development Goals (SDGs) to reduce neonatal mortality by at least 12 Per 1,000 live births and under-five years mortality 25 Per 1,000 live births. There was a decrease in IMR of 22.23 per 1000 live births^{(1),(2)} in Indonesia. However, the target of SDGs for reducing neonatal deaths has not been achieved yet⁽³⁾ throughout Indonesia especially in NTT Province, despite Governor Regulation No.42-2009 concerning Revolution of Maternal and Child Health has been launched and implemented.⁽¹⁾

The target of the MCH revolution was to reduce the infant mortality rate from 62/1000 live births in 2004 to 27/1000 live births in 2013. However, the number of infant deaths still very fluctuated between 1,272-1350 deaths when evaluated in 2015.⁽⁴⁾ Government has re-launched the Technical Guidelines for Leap to Decrease

Infant Mortality in 2015 with the target of reducing the Neonatal Mortality Rate (NMR) 14 per 1000 lives birth, Infant Mortality Rate (IMR) 23 per 1000 lives birth and Under five Mortality Rate 32 per 1000 lives birth at the end of 2015. The results showed that infant mortality rate also fluctuated, there were 1,388 cases in 2015, 1091 cases from 86,126 in 2016 and 874 cases out of 86,085 live births in 2017.⁽⁵⁾ However, the program was not fully successful in reducing infant mortality yet.

MCH is a topdown policy that should be government and community work together when formulating policies.⁽⁶⁾ The involvement of women as the main actors in the event of pregnancy, childbirth and caring for a baby is not yet apparent in the model of MCH Revolution. In fact, the role of mothers in the family on pregnancy, childbirth, postpartum period can be maximized. Bang, et al.⁽⁷⁾ stated that neonatal morbidity can be reduced by training mothers to care for neonates at home and providing maternal health education. Therefore, the aim of the study were to identify women's degree of participation, analysis the form of women participation and build the model of women participation in reducing infant mortality in Kupang regency.

Method

Qualitative research was used which phenomenology study design to explore women's participation in supporting government policies reducing neonatal mortality in Kupang District. This study was conducted in Kupang Regency, Middle Kupang District and West Kupang from January to March 2019. The District was chosen because the majority of the Helong Tribe is domiciled in Bolok Village, Batakte Sub-district, East Timorese are domiciled in the Penfui village of East Timor Kupang; and the majority of the Rote tribe domiciled in Mata Air village, Middle Kupang Tengah⁽⁸⁾

Participants were selected by using non-random purposive sampling to determine inclusive criteria including childbearing age women whose pregnant, postnatal, breastfeeding period until the infant was one year old; at least has an Elementary School degree, could read and write, and was willing to be an informant. Furthermore, snowball was used to obtain the subject until data saturation have been achieved. Seventeen main informant participated in this study including 3 triangulation. They were 7 Timorese people, 5 Rote tribes, and 5 Helong tribes. There were also 13 interviewees consisted of 3 chiefs village, 5 midwives and 3 health cadres.

Data were collected by interviews and FGDs. Structured interviews was chosen because each informant got the same question that had been prepared previously by the researcher. Interviews were conducted approximately 40-90 minutes and all conversations were recorded on tape. FGD is carried out for 4-5 hours. Data were analyzed using analysis of themes. There were 3 stages of data analysis consisting of: data reduction, display, and drawing conclusions.^{(9),(10)}

Findings and Discussion

Degree of Women's Participation

Following questions describe community exposure: "Have you ever heard the MCH program? Almost all informants and the village head answered that they were not exposed to information and never heard about policies. Meanwhile, midwives recognize the MCH Policy from books and the Head of the health center (FGD-March, 13).

....All pregnant women have to give birth in health facilities and be helped by midwives. During counseling we explained that each delivery must be in the health

facilities and every pregnant woman must check the ANC regularly at least 4 times (Mrs.E, 03-13/2019).

However, the technical guidelines for the Leap to Reduce Infant Death book launched in July 2015 were not yet known by midwives as well as the main informant and village head. Following is the statement of midwives: "to be honest, Madame, we don't know too much about this book (Mrs.R, 13/03/2019). Documentary evidence supported the midwife statement because the neonatal visit and postpartum columns are not filled by health worker. Meanwhile, Government emphasized that the supply side must visit a neonate three times consist of: 6-48 hours; 3-7 days and 8-28 days after birth. Postpartum visits three times including: 6 hours to 3 days; 8-28 days and 29-42 days after delivery. Satries⁽¹¹⁾ stated that lack of information from the government to the community illustrated that the communication was poorly built. A ladder of Citizens Participation⁽¹²⁾ was used to measure the degree of participation. The result of this study indicated that the level of participation was at a low level namely manipulation and therapy. Informants were used as an objects in the policies that have been set so that the target is achieved.

Form of Participation

1. Planning

Prenatal Plan

Most Timorese informants, reported their pregnancies at more than 2-6 months of gestation.

...."I have only reported five months of pregnancy because I did not plan.....from a last birth I want to take family planning injections.....hen I want to inject, my daughter asked me that I had to wait for my period but it did not happen until 5 months (Ny.PN, 01/29/2019)".

One of the government's policy in the MCH book is that women should report their pregnancy immediately when amenorrhoe. It seems that the results of this study did not support the policies. As a result, people who implement policies behave indifferently and passively because they feel the program do not belong to them.⁽¹³⁾

The following questions were asked to get information about maintaining the health of the fetus and the baby: "Did you plan check your health when you got pregnant?" Almost all informants said that they planned to go regularly to health facilities base on midwife's advice which refers to the policies.^{(1),(5),(14)}

This is contrary to the basic principles of The New Public Service proposed by Denhardt & Denhardt⁽⁶⁾ and Mikkelsen.⁽¹⁵⁾

The focus of attention in the implementation of public policy is the involvement of citizens since identifying problems, planning, implementing until monitoring and evaluating. However, the reality faced is focused at the application of old public administration character where policies are top-down.

Delivery plan

All informants planned to deliver at the health facilities and were helped by health workers. But there was one Timorese informant who had given birth at home helped by his mother-in-law.

.....At the beginning the birth was planned to be in the hospital and to get sterilization immediately. But my mother in law came and said that I have to give birth at home and so it happened. The reason is because my mother in law is a shaman so she knows to handle the birth (Mrs.MT, 01/30/2019).

Mother in-law is considered a helper and has power over pregnancy and childbirth in Timorese culture. These results supported the research of Khairunnisa et al.⁽¹⁶⁾ that the role of the family is very important in determining the place of delivery and birth attendance. Form of efforts to accelerate the decline in infant mortality is through delivery at an adequate health facilities and assisted by competent health personnel.^{(1),(14)}

Care plans for babies

All informants in this study planned to give exclusive breastfeeding for 6 months followed by complementary food such as sun porridge (most Timorese) and cooked, blended porridge mixed with vegetable (Rote and Helong) and immunization.

“Exclusive breastfeeding is 6 months. After that sun porridge was given (Mrs.BD, 28/01/2019)”.

This result contradicted with the information contain in the MCH book.⁽¹⁴⁾ Mother is recommended to prioritize the provision of complementary food from local food ingredients. Unfortunately, almost all informan did not read the pink book of MCH, even if they read many terms and procedures that were not understood.⁽¹⁴⁾ They did not get the information either from health workers.

The results of this study did not support the government policies about childbirth education at least 4 times. In this study all informants said that there had been no classes of pregnant women.

2. Implementation

Prenatal and breastfeeding period

All informants said that they would and had put everything they had planned such as checking themself regularly.

.....After knowing that I had been pregnant, I reported to the Health Centre and got the pink book, then my blood pressure was checked and was given folic acid and vitamin B-complex. Fetal heart rate, my height, and weight, laboratory tests for Hepatitis, HIV AIDS and HBSAg was taken (Mrs.ACT, 01/02/2019).

The form of community participation according to Andreeyan⁽¹⁷⁾ is the form of taking part in working together and donations of money or material, meanwhile Azhar⁽¹⁸⁾ is the ideas forwarded in development planning deliberation forum. Participation were a form of individual, family and a form of public involvement.⁽¹⁹⁾ In this study the forms of participation were part of the community and family members activities during pregnancy, and postnatal phase which are carried out according to plan.

3. Monitoring and Evaluation during prenatal and post natal.

Informants in this study said that fetal development and maternal health were checked regularly.

.....Because from the moment I became pregnant, my blood pressure was low so midwife said I had to rest a lot because I was afraid of bleeding during delivery. So I went to the hospital to check blood for Haemoglobin. From the village office, I once got rice, cooking oil, 1 pack of eggs, 510.000 rupees for my baby to buy side dishes. (Mrs.MLS, 01/29/2019).

All informants visited health workers to weighing babies and immunization eventhough the type and benefit of immunization are not understood.

“I gave birth in the morning, and back home in the afternoon. One week later I came to the clinic for immunization and control the baby”.

However, almost all informant did not make neonatal and puerperal visits 1,2,3.^{(1),(14),(20)} eventhough this visit is highly recommended in government policy because the death event occur during this period.^{(1),(14),(20)}

Firdaus⁽²¹⁾ stated that ways to identify whether activities has been deliver as close as possible to the plan called monitoring. While the assessment of the course of the program is called evaluation.⁽²¹⁾ Evaluations and monitors carried out in this study aimed more at monitoring fetal growth and development in the womb and evaluating the health of the mother. Postnatal women was evaluated on maternal health to monitor whether there were problems. For instance, there were a Timor tribe's informant planned to give birth at a health centre but eventually gave birth at Leona Hospital because she got pre-eclampsia since 8 months of gestation.

Women Participation Model Namely TIHERO

Proposition in this study is that the higher the knowledge of women the higher their participation in supporting government policies to reduce infant mortality. The citizens participation used in this study referred to "The Ladder of Participation Theory.⁽¹²⁾ Arnstein⁽¹²⁾ introduced 3 degrees of community participation consist of eight ladder of participation including: the highest degree is the power of citizens (control of citizens, delegated power, and partnerships); the second degree with 3 steps (placation, consultation and informing), the lowest degree is non-participation (therapy and manipulation). Overall, Arnstein's level of participation⁽¹²⁾ places more emphasis on the power of citizens, being objective conceptions. Arnstein discussed the level of participation structurally without taking into account the subjectivity of the women who participated in this study. Whereas in this study the subjective experience of a woman is more emphasized.

In this study women were not exposed to government policies even though they were experiencing prenatal, natal , and postnatal periods. The advice of health workers to success the government programs is passively accepted, because they have not been involved in the process of problem identification, planning, and policy formulation; and also they have cultural and hereditary values that must be adhered. Therefore women need to be encouraged to get into the public domain so that they can recognize the reality faced in relation to women's reproduction. The public domain is a place where people can express their aspirations as public opinion which

can be conveyed to the government for consideration in policy formulation.^{(22),(23)} According to Habermas^{(22),(23)} in the public sphere communication will be created in an open and equal public space from experts, bureaucracies, legislative commissions and the public in the forum. Habermas's view is very objective and structural without taking into account the subjective aspects as in this study. How about the women in this study who were considered as housewives those who were marginalized in development? How can they express their aspirations if they themselves do not know about the topic to be discussed?

The new ladder of participation from TIHERO woman has been proposed in this study based on Arnstein's theory. There were three degree of participation namely ladder of quality information; partnership; and independent in self-maintenance. Women need quality information so that they are aware that they have a great responsibility for the survival of a human child. This awareness will encourage them to learn about all things related to woman reproduction. Then partnership with health workers in gaining knowledge is needed. Women can be involved in the public sphere that is related to their baby's life and health, if they are knowledgable. They can regulate and control all their behavior and attitudes in maintaining themselves and their fetuses. So that the third degree is self-maintenance independently during prenatal, natal or childbirth, and postnatal.

Conclusion

The degree of participation is low which means that actually the community does not participate. Form of participations including: reported the pregnancy on time although there were several Timorese women who report late, gave sun porridge as complementary food by Timorese; determined to delivery at hospital by health worker eventhough one Timorese has been given birth at home, and took their children to be immunized although the types and benefits of immunization are poorly understood.

Precision of 3D MSCT Scan Diagnostocs on Maxillofacial Trauma Compared to Stabilization and Instrumentation Operation Results

Meitty Christina Hidayati¹, Anggraini Dwi Sensusiaty¹, Hari Basuki¹

¹Department of Radiology, Faculty of Medicine, Universitas Airlangga-Dr. Soetomo General Hospital, Surabaya 60285, Indonesia

Abstract

Handling standardized radiological readings of patients with maxillofacial trauma, particularly in radiology are currently absent. Appropriate and accurate of radiological reading results could be as the guideline for surgeons in determining surgical procedures. This study aimed to evaluate the diagnostic accuracy of maxillofacial fracture patients with head 3D CT scan compared to stabilization and instrumentation results as gold standard. Secondary data that derived from medical records were used as 29 patients with clinical maxillofacial trauma enrolled in this study at Radiology Section of Dr. Soetomo General Hospital from November 2012 to March 2013. The Mc Nemar test showed that there was no significant difference between the 3D CT scan results and the stabilization also instrumentation results with $p = 1.000$ ($p > 0.05$). While, the result was by calculating Kappa coefficient that a high suitability between head 3D CT scans and stabilization also instrumentation result with $\kappa = 1.000$, $p = 0.000$ ($p < 0.05$). There were several complications in the form of Cranium Bone Fraktur (25%), intracranial complication (15.24%), Haematosinus (52.38%) and Soft tissue haematoma (32.38%) with most intracranial complications ICH (31.25%), then, most soft tissue complications were in the Orbita region (26.47%) and the most common Haematosinus complications regarding Sinus Ethmoid and Maksilaris (29.09%). It concluded that the 3D CT scan results were in accordance with the results of stabilization and instrumentation operations.

Keywords: Maxillofacial Trauma, Head Ct Scan, Head 3D Scan, Stabilization Operation

Introduction

Handling standardized radiological readings of patients with maxillofacial trauma, particularly in radiology are currently absent. This standardization is of crucial importance because it affects the diagnostic accuracy, especially in trauma cases. Appropriate and accurate of radiological reading results could be as the guideline for surgeons in determining surgical procedures. Radiology examination was originally a head photograph, which is expected to evaluate the presence of fractures and some of the complications, but in cases of maxillofacial fracture, the modalities complexity has much deficiency because of it unevaluated the bones in an overlapping state¹.

CT Scan is used as an evaluation of trauma cases with an excess of axial reformed sagittal and coronal slices, MPR and 3D reconstruction that could evaluate anatomical structures more broadly and in detail. It could evaluate the state of the fracture to the size of <2cm, soft tissue, compartments that are regulated in craniomaxillofacial and evaluated the complications from intracranial hemorrhage to the presence of cranial also cervical fractures. Images of CT scan could be rotated, split, also anatomical structures could be separated and individual images of different tissue types could be generated. 3D images provide an overall spatial concept that allows a better understanding of the complexity of some 2D axial. 3D CT scan we are able to focus on specific areas of clinical and surgical concern. We could easily appreciate the postoperative improvement of possible complications. 3D reconstruction is useful in visualizing bone fragments from all points of view, not only the fracture fragments but suggestions of the

Corresponding Author:

Anggraini Dwi Sensusiaty

anggrainidwifkunjair@yahoo.com

mechanism of injury could easily assess. In addition, 3D CT scan reform has helped many patients with maxillofacial fractures².

This is in accordance with research conducted by Johnson and Feuerbach (2011) that stated by using conventional photos of bone trauma are technically difficult and only small information could be obtained. However, by using MSCT 3D with the volume rendering technique on fracture patients, it could be seen complex anatomical images such as facial bones from various orientations. A 3D MSCT image could make a better interpretation of difficult fracture than in CT cross-sectional image(Gillespie). 3D CT scans were performed on 100 patients with maxillofacial trauma, which 80% were male and 20% were female. Based on the etiology, road traffic accidents (75%) is the most common, followed by the attack (16%), decrease (7%) and sports-related accidents (2%), also 28 cases (28%). Head 3D CT scans have a significant degree of accuracy in determining the final diagnosis and treatment plan for the maxillofacial fracture. The conclusions were head 3D CT scans particularly valuable in assessing cases of maxillofacial fractures with the severe injury, allowing a clear perception of the primary rate of fracture line and resulting in fragment displacement. Modality allows precise surgical analysis and surgical planning compared to conventional radiography in cases of maxillofacial fractures³⁻⁷.

Based on the description above, the authors were interested to evaluate the diagnostic accuracy of maxillofacial fracture patients with the examination of head 3D CT scan that compared to the results of stabilization and instrumentation operations as the gold standard.

Method

Twenty-nine patients with clinical maxillofacial trauma at Radiology Section of Dr.Soetomo General Hospital Emergency Unit from November 2012 to March 2013. Total sampling with inclusion criteria conducted in this study was: Head 3D CT scans of maxillofacial clinical trauma patients and undergo stabilization operation and instrumentation.

A retrospective observational study by using secondary data derived from medical records was used, while the collected nominal data was arranged in tabular form and analyzed descriptively by calculating the sensitivity, specificity, positive and negative predictive

value also accuracy, followed by inferential analysis with Mc Nemar test and calculating Kappa coefficient.

Results

Characteristics The Study Sample

Twenty-nine subjects with maxillofacial trauma that consisting of 25 male (86.21%) and 4 female (13.79%) were obtained. There was a group of under 20 years old was 8 (27.59%) patients, age group 20 - 30 years old was 8 (27.59%) patients, age group 30-40 years old was 7 (24.14%) patients, age group 40-50 years old was 3 (10.34%) patients, and age group above 50 years old was 3 (10.34%) patients. The oldest was 52 years old while the youngest was 13 years old. From 29 patients, the injury was caused by traffic accident by 26 (89.66%), fell by 2 (6.90%), fights (3.45%) and sports (0%).

Characteristics of Maxillofacial fractures

Twenty-nine patients in this study were; who experienced a maxillofacial fracture was 27 (93.10%) and non-fractured was 2 (6.90%) (Table 1). Maxillofacial fractures were obtained on maxillofacial bone and zygoma bone (21.25%) and incarceration of rice and tooth septum (1.25%) (Table 1).

Table 1. Distribution of maxillofacial fractures according to affected bone

Bones	Frequency	Percentase (%)
Frontal Bone	7	8.75
Temporal Bone	4	5.00
Parietal Bone	3	3.75
Zygoma Bone	17	21.25
Orbital Bone	8	10.00
Nasal Bone	6	7.50
Maxilla Bone	17	21.25
Mandibular Bone	14	17.50
Ethmoidal Sinuses	2	2.50
Nasal Septum	1	1.25
Teeth	1	1.25
Total	80	100.00

Characteristics of Orbital Bone Fracture

The highest number of orbital segment fractures was on Supraorbital (27.27%) and infrequently on Lasser wing and Greater wing (0.00%) (Table 2).

Table 2. Characteristics of Fracture Segment Orbital

Segments	Frequency	Percentase (%)
Frontal Process	1	9.09
Supraorbital	3	27.27
Temporoorbita	0	0.00
Zygoma frontal process	2	18.18
Maksiloorbita	2	18.18
Lacrima bone	3	27.27
Lasser Wing	0	0.00
Greater Wing	0	0.00
Total	18	100.00

The most fractures obtained from the Zygoma Segments was on Orbital Process and Orbital Surface 12 (44.44%) also infrequently was Zygomaticofacial foramen 1 (3.70%). Meanwhile, fracture of Segment Zygoma mostly on left Frontal Process and Orbital Process was 8 cases.

Characteristics of a Zygoma Segment Fracture by Type of Fracture

The obtained fractures of the Zygoma Segment by Most Segmental Fracture Type was 53.33%.

Frontal Fracture

Most Characteristics of Frontal segments Fracture was Frontal bone (100%) and imprinted on the Peduncular plate (0.00%). Most Frontal Fractures on Frontal bone on the left side was 5 cases. The most characteristics of Frontal Segment Fractures based on fracture type was Segmental Type (80%).

Nasal Bone Fracture

Most nasal segment fractures were Nasal Bone characteristic (75%) and inhibited Peduncular plate (0.00%). Most Nasal Segment Fractures regarding Nasal Bone on both right and left side was 2 cases, while, most

Nasal Segment Fracture Based on Types of Fracture was Segmental Types (66.67%).

Maxilla Bone Fracture

Most maxilla segment fracture distribution of Orbital surface 11 frequency (27.50%) and infrequently on Temporal Process also Frontal Process 5 frequency (12.50%). Most of the maxillary segmental fracture characteristics on left side orbital surface were 10 cases. While, most Fracture of the Maximum Segment by Type of fracture was segmental and communitive Type (43.75%).

Mandibular Bone Fracture

The most characteristics of Mandibular segment fracture was Symphysis Mandibula (34.48%), infrequently was Condylar Process and Coronoid Process (0.00%) (Table 3). Then, the most Mandibular Segment Fractures was Symphysis Mandibula on the right side were 7 cases. While, the most Fracture of Mandibular Segment by Type of Fracture was Segmental and Communitive Type (42.86%).

Table 3. Characteristics of Mandibular Segment Fracture

Segments	Frequency	Percentase (%)
Condylar Process	0	0
Coroid Process	0	0
RamusMandibula	3	10.34
AngleMandibula	4	13.79
BodyMandibula	8	27.59
Alveola Process	4	13.79
Symphysis Mandibula	10	34.48
Total	20	100

Special Classification of Maxillofacial Fracture

Twenty-nine Orbita Fracture patients who experienced NOE type (Naso-Orbita-Ethmoidal) was 1 (3.45%) and Blow Out Orbita was none The classification distribution of maxilla fracture type Le-Fort 1 was 4 people (13.79%), Fracture Max type Le-Fort 2 and Le-

Fort 3 was none. Two-types head fractures that excluded in the Maxillofacial Fracture group was Cranii Bone Fracture (25%) and Occipital Fracture (75%).

Complications

Characteristics of maxillofacial fractures according to the appear complications from 29 patients were intracranial complications 16 (15.24%), Haematosinus

55 (52.38%) and Soft tissue hematoma 34 (32.38%). The most intracranial complications were ICH (31.25%) and infrequently were EDH (0.00%) (Table 4). Complications in the softest tissue was Orbita region (26.47%) and infrequently was Parietal Region (2.94%) (Table 5) The most common Haematosinus complications was Sinus Ethmoid and Maksilaris (29.09%) also Nasopharynx (1.82%). (Table 6)

Table 4. Distribution of intracranial complications

Intracranial	Frequency	Percentase (%)
ICH	5	31.25
IVH	0	0.00
SAH	3	18.75
EDH	0	0.00
SDH	2	12.50
Pneumatochele	3	18.75
Difusaxional brain injury	3	18.75
Total	16	100

Table 5. Distribution of complications in soft tissue

Region	Frequency	Percentase (%)
Ocipital	1	2.94
Frontal	6	17.65
Temporal	7	20.59
Parietal	1	2.94
Orbital	9	26.47
Nasal	4	11.76
Fasialist	6	17,65
Total	34	100.00

Table 6. Distribution of complications in haematosinus

Sinus	Frequency	Percentase (%)
Maxillary	16	29.09
Ethmoid Sinus	16	29.09
Frontalis	6	10.91
Sphenoid	7	12.73
Nasal Cavum	9	16.36
Nasopharynx	1	1.82
Total	55	100.00

Stabilization and instrumentation operations

From 29 patients, stabilization action and instrumentation were performed in the form of closed reposition was 3 (6.25%), open repositioning wiring was 15 (30.61%), Open Repositioning plating was 23 (46.94%) and Butterfly Gypsum was 7 (16.33%).

Comparison of MSCT Scan examination results and Stabilization also Instrumentation operations.

All of the total subjects, only 14 subjects the researchers could get from the patient’s medical records, from the 14 existing data with maxillofacial trauma, 3D CT Scan and result of stabilization and instrumentation operation were obtained. True Positive (TP) = 100%, True Negative (TN) = 100%, False Positive (FP) = 100%, and False Negative (FN) = 100%. (Table 7).

Table 7. Results of Stabilization & Instrumentation Operations

		Operation stabilization & instrumentation results		
		Positive	Negative	
3D MSCT Scan	Positive	14	0	14
	Negative	0	2	2
		27	2	29

Mc. Nemar p=0.000

Kappa=1.000 p=0.000

The result of Mc Nemar test showed no significant difference between head 3D CT scans result and stabilization also instrumentation operation with $p = 1,000$ ($p > 0.05$). While the of the analysis by calculating Kappa coefficient shows that there was a high suitability between head 3D CT scans with stabilization and instrumentation result with $\kappa = 1.000$, $p = 0.000$ ($p < 0.05$).

Discussion

A Head 3D CT Scan with Volume Rendering (VR) to display bone images in 3D reconstruction was

used, while 3D reconstruction was considered as the best modality in looking at the anatomical structure of bone because it produces spatial resolution and builds a combination of ultra-thin submillimeter combinations of slices^{8,9}.

In the study, the epidemiologic incidence of maxillofacial trauma was more common in male (86.21%) than female (13.79%) with the most in <20 years old group and 20-30 years old group (27.59%). The mechanism of etiology injury was a traffic accident (89.66%). This was in accordance with previous

research which states that the incidence rate was higher in men (20-29 y/o) with the etiology of traffic accidents, especially motorcycles.

The physical examination of the maxillofacial trauma patient was insufficient to maintain the maxillofacial fracture diagnostic, it still needs radiological examination. From a radiological examination that using a head 3D CT scan, it was found that patients with maxillofacial fractures (93.1%) and had no fracture (6.9%) with the most fractures occurring was in zygoma and maxillary bone (21.25%). This was in accordance with the previous study that most fractures occur in the maxillary bone due to bustrecess in the maxillary region^{10,11,12}.

Maxillofacial trauma results were; a severe variation injury, bruise, excoriation, various vulnus of soft tissues to fractures. Maxillofacial fractures only occur in one place or complex, due to impact with low strength or high strength (> 50% gravitational forces). Maxillofacial fractures will unreleased from the head injury due to the location and adjacent structures. Maxillofacial structures were considered reducer due to trauma, thus to protect the intracranial structure^{13,14,15}.

There were several complications in the form of Cranium Bone Fracture (25%), intracranial complication (15.24%), Haematosinus (52.38%) and Soft tissue haematoma (32.38%), the most intracranial complications was ICH (31.25%), most soft tissue complications was in the Orbital region (26.47%) and the most common Haematosinus complications was Sinus Ethmoid and Maxilla (29.09%). This was in accordance with previous studies that stated, 253 maxillofacial fractures patients with the head injury was 20.2%, maxillofacial fractures accompanied by intracranial hemorrhage was 28.3% in the upper third of the face while Maxillofacial fractures accompanied by a cranial fracture was 57.1%.

Conclusion

The 3D CT scan results were compatible with the results of stabilization and instrumentation operations.

Ethical Clearance: The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, nonmaleficence, and justice.

Conflict of Interest: There is no report of conflict of interest involved with this study so far.

Breast Cancer Risk Trends of Iraqi Women

Minen Al-Kafajy

Department of Microbiology, College of Medicine, Thi-Qar University

Abstract

Background: Breast cancer (BC) are one of the significant prevalence malignances among Iraqi women, which ranked as the number one cancer documented in all provinces. Although there is a rising incidence in the frequencies of BC, there were not enough studies conducted on the incidence's frequencies over the Iraqi women in Thi-Qar provinces. It is well-known that incidence rates are informative. Analysis of tendencies would advantage in planning and organizing programs for control cancers incidence. **Objective:** The objective of the following study is to calculate the risk of BC using updated data from the cancer registries in the Iraqi health ministry and document its tendencies that released in different periods. **Materials and Method:** Data on incidence rates of BC were obtained from cancer registries of Iraq for the period between 2009 and 2015. Annual percent change in incidence and risk in terms of one in the number of women likely to develop cancer was estimated for both cancers' types in five cities in Thi-Qar province. **Results:** The incidence of BC ages group (45-49), (50-54) and (60-64) were significantly increased, while the age group (15-19) were significantly decreased. On the other hand, the higher increase in the incidence of BC in 2015 was reported to be 84 and 29 cases in Al-Nassiriya and Al-Shatra cities, respectively. **Conclusion:** Al-Refaey region recorded a decline in the incidence of BC, which is contrary to the observation in other cities, which showed an increase in breast cancer. On the other hand, the north side of the city which known to be more contaminated with pollution has higher incidence rate.

Keywords: *Breast cancer, cancer Age groups, Thi-qar cities*

Introduction

Breast cancer (BC), until today, is the most prevalent cancer diagnosed in women worldwide. BC ranks second, and cervical cancer ranks seventh according to the incidence of malignancies globally¹. Western countries have reported a specific decline in BC trends and incidence, while it is still a significant issue in developing countries.

International Agency for research cancer (IARC) has narrated that female breast cancer is a heterogeneous disease and responsible about 11.6% of total cancer incidence, and documented to be a commonly diagnosed cancer and ranked as the highest occurrence of all

females cancer types and as number one leading death for women worldwide¹. BC is the main prominent cancers sites amid Iraqi women with 13,4420 incident cases, 338,010 five yearly prevalence (Iraqi cancer registry 2009-2015).

The molecular biology reasons that underlay the breast cancer causes are variable. However, a higher number of scientists have documented that BRCA1 and BRCA2 are the two main tumor suppressor genes that are linked to breast cancer². Moreover, ZHX3 gene has been linked to be down regulated in breast cancer³. The rest of the ZHX family can also be disturbed in cancer⁴.

Mercifully, breast cancer is exceedingly treatable if diagnosed at earlier stages, but it might be extreme if identified at later stages⁵. In Asia, and particularly in the middle east, there is a climbing frequency of breast cancer even though they migrated to western countries decades ago.⁶ Counter to the latest downturn in the breast cancer episode in Western nations, the occurrence in Iraq has been increasingly growing. The predicted

number of Iraqi's community in 2015 is 36,933,714 included 18,659,573 males and 18,274,141 females. (Ministry of planning / Central Statistic Organization). The quantity of breast cancer in Iraq which is 3763 cases in 2009 as it documented in the cancer registry data distributed by the Iraqi cancer board, has reached a terrifying number in 2015, so breast cancer boosted to be second female mortal cancer in Iraq. In 2015, 143 cases were registered as positive breast cancer in Thi-Qar exemplified by 11.7% of all cancer cases displayed in the city. These data shift us to focus on the next step towards examining the epidemiology and the ground that underline the breast cancer bias. BC patients can persist if they diagnosed at earlier stages. Therefore, there is an increasing incidence of breast cancer death for women living in the rural as compared to women living in the city.

Materials and Method

Data on prevalence rates of BC was obtained from the yearly book series issued by the Iraqi Cancer Board (ICB) at the Ministry of Health. The ICB is reliable for collecting the information related to every newly diagnosed cancer patient in both government and private hospitals and clinics. There were eighteen Population-based cancer registries for the years 2009- 2015. ICB brings out a comprehensive yearly report having various data summaries, for example, the occurrence and fatality rates. The approachability of data in different cities of the country depends on the year a particular registry came into the network of ICB and or preliminaries of the record in a specific area. Data for the years 2009-2015 were prepared for the eighteen provinces. Though the ICB cancer registry was established in 1990, the International classification of diseases (ICD) coding used was as per ICD. Age-specific annual cancer incidence rates for either sex in different registries for breast and cervical cancer sites for ages in the range of 15-64 years were used for computations. I focused in my project on breast cancer cases for the two separate registries which are 2009 and 2015 for the whole country were used for trend analysis. I centered my study on the age groups (15-19), (20-24), (25-29), (30-34), (35-39), (40-44), (45-49), (50-54), (55-59), (60-64) and (65-69). These data were plotted and analyzed using Excel.

Thi-Qar province breast cancer incidence for the period between 2009-2015 was plotted and statistically analyzed. Moreover, I compare the extent between the five cities that geographically belong to Thi-Qar

province, which is Al-Nassiriya, Al-Refaey, SookAl-Shiookh, Al-Jabesh and Al-Shatra. For assessing trends, exponential regression analysis was performed on age-adjusted rates (AAR) of incidence for breast sites in various registries. The common hazard is the probability that somebody will be diagnosed with cancer through a particular age time in the absence of any competing cause of death.

Nonetheless, APC in incidence would give better knowledge. The risk statistics based on frequency is not a replacement of incidence rate itself. The cumulative risk as one in number of persons developing cancer is an easily understandable statistics for public health communications for the respective governments and the use by the policymaker.

I focused on my analysis on examining women aged (12-70 years) and categorized according to the age groups like 15-39, 40-49, 50-59, 60-69, and 70+ years.

Statistical Analyses

All statistical analyses were performed using SPSS statistical software.

Results

Iraq breast cancer incidence over six years periods:

The BC cases were increased over the six years period (2009-2015). The elevation was documented to be significant between the group ages (30-34) which showed $p=0.05$, (40-44) $p=0.04$, (45-49) $p=0.005$, (50-54) $p=0.002$, (60-64) $p=0.004$, (65-69) $p=0.03$ figure (1).

Thi-qar breast cancer incidences

In 2009, 97 cases were reported in Iraq, which represent 16.28% of all the cancer cases that have been reported in this year. On the 2015 report, Thi-Qar reported having 143 cases which represented 11.7% among all types of cancers reported in this year. I think it should be 133 because the summation of all cities new cases is 133, not 143. By this, the percentages would be 10.7%. The comparison of Thi-qar cities has shown that Al-Nassiriya has reported to have significant increased $p=0.04$, Al-Refaey has no differences, Sook Al-Shiookh reported decreased in the incidence, Al-Jabaish has few numbers of cases but statistically considered significant. Finally, Al-Shatra has 18 cases in 2009 and

increased to be 29 in 2015, statistically is considered significant increased $p=0.04$ (Figure 2).

Figure 1: The significant increase in the breast cancer incidence in Iraqi women detected in four age groups

Figure 2: Thi-qar districts distribution of breast cancer over six years periods

Discussion

We still scratching the surfaces in term of learning the epidemiological characteristics of breast cancer in

Iraq. The ICB has used Can Reg4, while my study has investigated the data using SPSS. The study documents notified trends of breast cancer up to the recent year of 2015 on data is achievable by Iraqi board of cancer. The hazards as one in the number of women progress breast cancer are interpreted for all provinces in Iraq for 2009 and 2015.

The data in figure (1) suggested that Cancer registries propose that the age 15 is rarely getting cancer which might be because the high immune system for women in this age and it is the beginning of feminine hormonal to be produced. These finding is coming along the data that been reported by ⁷ who found that BC is highly variable upon menopausal status, body mass index and the activity of the immune system.

Cities in Thi-qar such as Al-Refaey and sookalshiookh did not show any significant increase in the breast cancer incidence. On the contrast, Al-Nassiriya and Al-Shatra observed a significant increase in the risk for breast cancer (figure 2).

In the destiny, we are looking for an extensive case-control study that can follow the patients since they have been diagnosed with the disease and support them in regulating their blood parameters, body mass and their response to the chemotherapy or radiation. Moreover, several genes have been studied universally such BRACA1 and BRACA2 ².

Conclusion

My study significantly highlighted the dramatic increase in the number of breast cancer patients via the six-year study periods in the whole country in general and in specific in Nassiriya. The increased was spectacular in the highly polluted cities, including Nassiriya and Shatra. My project highlighted the need to establish a cancer center in Shatra since it is statistically more prone to have double the number of cases in the next six years period. The increased knowledge among the physicians about breast cancer clinical exhibitions early laboratory diagnosis and information in society will help to lessen the morbidity and mortality correlated with disease.

Colorectal Cancer in Nineveh: Five Years Survival Rate

Moayad Aziz Alabdaly

Lecturer, PhD, Department of Family and Community Medicine, Medical College, University of Nineveh

Abstract

Overall, colorectal cancer ranks third in terms of incidence but second in terms of mortality, according to the latest GLOBOCAN worldwide estimation in 2018. The aim of this study is to show the survival rates of colorectal cancer patients in Nineveh province for the period 2010 – 2014, a retrospective cohort study, conducted among patients at the Mosul Cancer Registry center. Survival analysis was carried out using the actuarial method to construct the needed life tables. Chi-square test, was used to study the relationship between cancer occurrence and sex, age and stage. The result of this study indicates that the 5 year survival rate (50.1%) with 95% confidence intervals (0.4985-0.5035) in Mosul was between developed and developing countries. The survival of colorectal cancer in men (50.0%) was significantly better than women (43.0%), older patients ≥ 70 years, had a poorer survival rate (25.9%) compared to younger patients <50 years (70.5%) and the survival rate by tumor stage was better in the localized stage (75.4%) than regional and distant stages of (63.6% and 11.7%) respectively.

Keywords: *Colorectal cancer, 5-year survival rate, Mosul Cancer Registry center*

Introduction

Over 1.8 million new colorectal cancer cases and 881,000 deaths are estimated to occur in 2018¹. Colorectal cancer (CRC) is the third most common cancer in men and the second in women, according to the latest GLOBOCAN worldwide estimation in 2012^{1,2}. About 55% of the cases are reported in the more developed countries. The highest rates were estimated to be in Australia/New Zealand: 44.8 and 32.2 per 100,000 in men and women, respectively, and the lowest in Western Africa (4.5 and 3.8 per 100,000)². Colorectal cancer is a major cause of morbidity and mortality throughout the world³. It accounts for over 9% of all cancer incidence^{4,5}. It is the third most common cancer worldwide and the second most common cause of death^{1,4}. It affects men and women almost equally³⁻⁶. Colorectal cancer is one of the ten leading cancers in Iraq, accounting for 4.8% of estimated cancer cases in males and 3.8% of estimated cancer cases in females⁷.

Aim of The Study

The aim of this study is to show the survival rates of CRC patients in Nineveh province for the period 2010 – 2014.

Objectives

1. To describe the sociodemographic characteristics of the CRC patients.
2. To calculate the 5-year survival rate (5YSR), according to the age, sex and stage of the cancer.

Materials and Method

Study Settings:

This was a retrospective cohort study, conducted among patients at the Mosul Cancer Registry center (MCRC). This study protocol was approved by the local ethics committee of Medical Collage, University of Nineveh and also obtained from the directorate of health in Nineveh

Study sample:

The sample of the present study included all colon and rectum cancer patients registered at the Mosul cancer registry center in Nineveh in 2010 to 2014 of all ages and both sexes. A total of 460 cases of CRC, recorded were retrieved from the medical records of MCRC.

The cancer cases are registered with respect to patient number, age, sex, clinical stage and cancer coded according to the International Classification of Diseases

(ICD10)^{8,9}. All the data are fitted on Can Reg 3 format and fed into the computerized database of the MCRC.

Staging is done according to the summary stage system^{10,11}. The cancer has become invasive and is categorized as local, regional, or distant based on the extent of spread¹². Stage “unknown” has been recorded to include tumour morphologies for which the summary stage system is not strictly applicable and patients with cancer of an unknown stage or carcinoma in situ were excluded from the present study.

The criteria of the age groups chosen were those used for the international standard cancer patient population¹³. With age been categorized into three groups (<50, 50–69 and 70+ years).

The sex was examined as a potential confounding variable for CRC for presentation of some descriptive results.

Survival Analysis

Survival analysis was carried out using the actuarial method to construct the needed life tables¹⁴. **Observed survival rate “OSR”** is the probability of surviving from all causes of death in a group of cancer patients under study. Observed survival was measured from

the date of diagnosis to the date of death or censoring, whichever occurred first^{14,15,16}. Cancer patient survival was estimated as the cumulative probability (range 0 to 1) of survival up to a stated time after diagnosis¹⁷. This method has been used in this study to estimate the absolute survival probability¹⁸. In the present study, period analysis was used to derive 5-year survival estimates for 2010-2014^{19,20}.

Statistical Analysis

95% confidence intervals and calculation of the standard error (s.e.) of the 5YSR obtained by the actuarial method uses the Greenwood’s formula^{14, 21}. Chi-square test was used to study the relationship between variables and some results²².

Micro Soft Excel 2010 was used for statistical analysis.

Results

The total number of the CRC cases, according to age, sex and stage of extension are shown in Table 1. The result is significant at $p \leq 0.05$, except for sex, the result is not significant and the chi-square statistic is 2.513.

Table 1: The frequency distribution of the colorectal cancer cases, according to age, sex and stage of disease.

Colorectal Cancer Cases (460)		Date of Diagnosis					Total	%	p-value
		2010	2011	2012	2013	2014			
Age group	<50	22	41	30	29	32	154	33.5	< 0.00001
	50-69	38	34	49	42	61	224	48.7	
	≥70	11	8	20	21	22	82	17.8	
Sex	Female	28	42	50	48	45	213	46.3	0.11291
	Male	43	41	49	44	70	247	53.7	
Stage	Local	14	8	26	17	27	92	20.0	< 0.00001
	Regional	30	42	34	25	51	182	39.6	
	Distant	26	21	27	27	28	129	28.0	
	Unknown	1	12	12	23	9	57	12.4	

To CRC death, about half of people (50.3%) die, is of 55-69 year of age, as shown in Table 2,

Table 2: The frequency distribution of the colorectal cancer deaths, according to age, sex and stage of disease.

Colorectal Cancer Deaths (163)		Date of Diagnosis					Total	%
		2010	2011	2012	2013	2014		
Age group	<50	0	3	11	9	13	36	22.1
	50-69	3	7	17	21	34	82	50.3
	≥70	6	2	6	12	19	45	27.6
Sex	Female	2	6	15	17	36	76	46.6
	Male	7	6	19	25	30	87	53.4
Stage	Local	0	0	3	9	6	18	11.0
	Regional	2	5	11	16	17	51	31.3
	Distant	7	7	16	15	35	80	49.1
	Unknown	0	0	4	2	8	14	8.6

Table 3, shows the CRC survival rate declined from 70.5% in the ≤50 age group to 25.9% among those aged ≥70 years. There was an greater difference in survival rates between female and male, which were 43.0% and 50.0%, respectively and between stages.

Table 3: The 5- year observed survival rate of the colorectal cancer cases, according to overall, age group, sex and stages for the period from (2010-2014)

Colorectal Cancer		OSR	95% CI
	Overall	0.501	0.4985-0.5035
Age Group	<50	0.705	0.7003- 0.7100
	50-69	0.518	0.5127- 0.5240
	≥70	0.259	0.2152- 0.3032
Sex	Female	0.430	0.4251- 0.4343
	Male	0.500	0.4954 - 0.5045
Stage	Local	0.754	0.7469- 0.7603
	Regional	0.636	0.6305- 0.6411
	Distant	0.117	0.0975- 0.1363

Discussion

Previous studies in other countries have reported variable CRC survival rates.

In Asia, the highest survival rates were found in China (68.0%)²³, the lowest rate was in India (33.6%) and Malaysia (34.3%)^{24,25}. This study showed that the overall 5YSR for patients with CRC was 50.1%. Various studies from Iran have reported 5YSR of CRC of 47%, 41% and 61% respectively²⁶⁻²⁸. In Saudi Arabia, the overall 5YSR of the CRC was 44.6%²⁹. The disparities in CRC survival between Japanese, Mediterranean countries could also be attributed to many factors, together with variations in socioeconomic standing, stage at identification, treatment, medical practitioner characteristics, and hospital factors. In Japan in 2005, the 5YSR was reported at 61.4%³⁰. Also, studies in Germany, USA, England, France, and Italy were reported the 5YSR 65%, 65%, 52.7%, 60.3% and 59.3% respectively³¹⁻³⁴. The 5YSR of patients with CRC in our city is lower than the developed regions. Therefore, we conclude that the survival rate of patients with CRC in Mosul is between developed and developing countries, like other patients in the world depend on various factors such as demographics, pathologic and tumor characteristics, geographical distribution and gene mutation or have a family history of^{35,36}.

In this study, there is no significant difference in the occurrence of CRC between females and males (p-value= 0.11291), but differences in survival rates were reported, 43.0% and 50.0%, for females and males, respectively. Yet, other studies had reported a lower 5YSR in females^{2,37}. The absence of gender differences in survival rates was reported in some of the previous studies^{23,25}. In a study in Germany and Cuba, the 5YSR in women was better than men that were not similar to the result of our study^{38,39}. The reason for better survival in men than women in this study may be due to a higher participation rate in men compared with women for screening programs like fecal occult blood test and colonoscopy⁴⁰.

This study showed that the hazard of death increased significantly with increased age being the highest in the age of ≥ 70 years. This result was reported in other studies²⁷ that showed that older patients had a poorer survival rate compared to younger patients. However, other studies^{26,41} reported no difference in survival according to age. The contradictory results of previous studies on age may be due to the inclusion of patients

from single referral centers and poor adjustment for the effect of possible confounds.

One of the most important factors that influence the survival of patients with CRC was the stage of diagnosis. Which were 75.4%, 63.6% and 11.7%, for local, regional and distant stages respectively. This finding is consistent with findings of other studies; in the USA, 5YSR is 90%; survival in local stage, declines to 71% and 14% with regional and distant stages, respectively³⁴, also in European countries, localized CRC reached levels close to 90% and 15% in the case of distant stage³⁸, while in Saudi Arabia, 63.3% for localized disease, 50.2% for those with regional disease, and 14.7% for patients with distant stage²⁹. But the most important factor for our CRC patient is that the disease diagnosed at an advanced stage⁴². So this significant difference in 5YSR may be due to, poorly established screening program like the fecal occult blood test, sigmoidoscopy and colonoscopy and limited accessibility in developing region⁴³.

Conclusions

In conclusion, the result of this study indicates that the 5YSR of patients with CRC in Mosul was between developed and developing countries. The survival of CRC in men was significantly better than women, older patients had a poorer survival rate compared to younger patients and the survival rate by tumor stage was better in the localized stage than other stages of CRC.

Significance of Fingerprints in A Brutal Travel Bag Murder- A Case Report

Mohammad Ahmad Abdullah Ahmad AlSuwaidi¹, Abdulrahman Mohammed Obaid Almehiri², Mohammed Thani Rashid Almarri¹, Jassim Mohammed Abdullah Rashid³, Bhoopesh Kumar Sharma⁴

¹Lieutenant and Assistant Expert, General Department of Forensic Sciences and Criminology, Dubai Police General Head Quarters, Dubai, United Arab Emirates, ³Lieutenant Colonel and Senior Expert, General Department of Forensic Sciences and Criminology, Dubai Police General Head Quarters, Dubai, United Arab Emirates, ⁴Associate Professor, Department of Forensic Science Amity University Dubai, United Arab Emirates

Abstract

Forensic Science can be defined as the application of science to law. On the crime scene, sometimes the odour of the evidence plays a vital role in the location and identification of the evidences. The present case is one of the best examples of this. Dubai police were informed about a bad smell emanating from an apartment in one locality. After an investigation, the investigators and the forensic expert discovered that the smell was from a decomposing human body. Immediately the fingerprints experts were called to the crime scene to collect, identify, and analyze all the fingerprints encountered. This case reflects the precision, accuracy, and reliability of the fingerprint expert and the technology used by them, including chemical methods like ninhydrin and cyanoacrylate along with the high efficacy of the Automated Fingerprint Identification System. The case was uniquely solved with the aid of fingerprint analysis.

Keywords: *Crime Scene, Fingerprints, cyanoacrylate, Ninhydrin, Automated Fingerprint Identification System.*

Introduction

Fingerprint evidence has been acknowledged as the gold standard in forensic science for more than a century¹. Fingerprints are the patterns created on the fingertips by the raised papillary ridges with rows of pores connected to the sweat glands². A fingerprint is a science of using an individual's physical representative to identify the person. It's unique as no two individuals were found to have the same fingerprint³. On the other hand, this case is also a typical case based on the particular type of odour (smell) from the dead body, that had served a significant mean of locating the evidence in the presented case. When odor molecules stick to the cell membrane, odors are sensed – this process is known as adsorption. The objective of this case is to

show the accuracy, determination and expertise of the experts at the General Department Of Forensic Science and Criminology also, how the investigator can use the primary evidences as basic tools in the criminal investigation and identification.

Background of the Case

On the 19th of April 2017, Dubai police received a call regarding a fouling stink approaching from an apartment in one of the locality. After investigation, it was discovered that the smell was arising from a decomposing human body. Further, it was found that a woman had been murdered and the body was hidden inside a travel trolley bag in her apartment (figure 1-2). Immediately the fingerprint experts were called in to collect all essential evidences from the crime scene to be tested for latent fingerprint by appropriate technique.

Figure 1: Image of the apartment from where the fouling odour was approaching to the nearby surroundings. The suspected travel bag was lying on the floor.

Figure 2: The picture of the blood-stained travel trolley bag, where the dead body of the victim was kept, and fingerprints were collected from the bag and the surrounding areas.

Challenges for the Investigators

The body becomes flaccid, and blood ceases to circulate after the cessation of heart function. The body undergoes some well-documented modifications, known as the livor, rigor, and algor mortis “classic triad”.

Typically, a human body takes between one to three days to start decomposing after death⁴. The rate at which the body decays depends on several factors; how intact the corpse was at the time of death, the temperature and humidity of the environment where the body is kept. If

the body had skin breakages/injuries at the time of death, the body decomposes faster and smells sooner than the latter⁵. On the other hand, if the body is kept in an environment with high temperature and/or high levels of humidity, it decomposes faster and smells sooner than if it were kept in a cold dry environment.

It is plausible that the body at the apartment had been kept there for at least a day and a maximum period of three days. The apartment is usually regulated for temperature and humidity; thus, the body would have decomposed at the standard rate. The fact that the body was in a travel bag shows that the perpetrator(s) were trying to cover up the incidence until they had exited the apartment and its premises. By the fact that the victim's body was found in her apartment hidden in the bag, it is possible that the murder was committed within this apartment. Dubai police confiscated the bag in order to test for latent fingerprints.

Material and Method

In an attempt to reveal the fingerprints on the travel bag, the Fingerprint Department encountered two challenges. First, the inside part of the bag was covered by the victim's body fluids. This made it challenging to test and detect fingerprints on the inside, which would shed insight into the identification of the murderer. Cleaning of the bag or any similar attempts would result in loss of this vital evidence for the investigation, and the fingerprint experts had to be careful and methodical in identifying the prints. Secondly, the interior design of the travel bag was curved, making it difficult for experts to capture it with digital cameras.

The Fingerprint Department resorted to utilizing two main techniques; cyanoacrylate fuming, and ardrox. Cyanoacrylate fuming method uses the vapor of superglue to detect latent fingerprints on non-porous surfaces including glass, unfinished wood, plastic, and rubber bands⁶. This technique relies on the deposition of polymerized cyanoacrylate esters on the residues of latent fingerprints. After implementing this technique, the latent fingerprints become visible. This technique was implemented on the inside and outside of the travel bag, given that the latter is made of plastic.

Findings

Consequently, two fingerprints were detected on the outside and inside of the bag. The prints, however, were not clear enough for the analysis and the decipherment.

This necessitated the use of a second technique; ardrox. Ardrox is a fluorescent liquid dye that stains prints detected using the cyanoacrylate technique. Ardrox works well with Ultra Violet (UV) light, lasers as well as other alternative light sources. When used with cyanoacrylate, ardrox forms a compound that emits secondary radiations under UV light⁷. This compound enables experts to view and photograph fingerprints on a multi-colored and non-porous materials⁸.

After applying ardrox, the fingerprints on the inside and the outside of the travel bag became more explicit, allowing appropriate viewing and photographing. The results of the fingerprint examination revealed a set of prints that were matched those of a suspect.

Conclusion

The fingerprints still serve as an essential tool for the forensic expert during the investigation of the crime⁹. The most important consideration is the type of print encountered, its condition, nature, and the kind of surface it has been encountered¹⁰. Many times it is challenging to rely on the fingerprint evidence solely because of lesser ridge details or the inappropriate surface for the development of fingerprints¹¹. However, due to the cutting edge technology and trained experts in the field, we can reach conclusive results in many cases as happened in the presented case. The fingerprints of the suspect were found on both the inside and outside of the travel bag, even though they were not identical. Fingerprints are the most valuable sources of evidence for crime owing to their two main features; uniqueness and their never-changing nature¹². Accordingly, no two individuals have similar prints, and no two fingers of the same person are ever identical. Fingerprints also do not change for the entire of an individual life. The two prints on the travel bag matched those of the suspect and were not identical since they were from different fingers.

The suspect must have murdered the lady in her apartment. This is revealed by the presence of prints on the bag, an indication of involvement in the act. The prints on the inside of the bag indicate that the suspect tried to pack the body in the travel bag. The suspect must have handled the body in the events leading to the demise and hiding of the body in the apartment.

Detect the Infection with Rubella Virus and Toxoplasmosis in Pregnancy Causes Suffering from Early Abortion by Using Real Time PCR

Mohammed Ayyed Najm¹, Hadeel Abdelelah Abdel Razaak², HayfaaMahmood Fahad³

¹Faculty of Pharmacy, Al-Rafidain University College, Baghdad-Iraq, ²University of Anbar / College of Science / Department of Biology, ³College of Medicine /AL Iraqia University

Abstract

Congenital infections may cause fetal death or newborns with brain malformations, little information is available about the but the impact of these diseases on the outcome of pregnancy. In this study we tested the IgG and IgM antibodies for both *Toxoplasma gondii* and Rubella. among 58 pregnant women with abortion. and in order to differentiate between the serological and molecular detection methods the samples were also tested for both *Toxoplasma gondii* and Rubella by RT-PCR. The results showed that there is a positive relation between the infection with rubella and the infection with toxoplasma ($p=0.022$, $Odd= 4.9$) and this co-infection attribute to abortion in women. and these results of RT-PCR were significantly different than those with ELISA test.

Keyword: *Toxoplasma gondii*, pregnancy, abortion, newborns, brain malformations

Introduction

Birth defects are one of the most urgent global health problems affecting millions of births worldwide, but the causes remains unconfirmed [1]. Genetic and environmental factors have been found to cause these defects [2]. Congenital infections such as toxoplasmosis and rubella are known to play a non-negligible role in the development of brain malformations [3].

Toxoplasmosis is caused by the obligate intracellular protozoan *Toxoplasma gondii*. It is one of the most prevalent chronic infections affecting one third of the world's human population[4]. *Toxoplasma gondii* infections can cause to a more serious progression when accompanied with some other infection such as HIV and HBV [5]. Congenital infections such as toxoplasmosis and rubella are known to play a non-negligible role in the development of brain malformations [6]. *Toxoplasma gondii* seropositivity and coinfection with TORCH pathogens have been investigated in Qatar with the intention of testing the patients who are considered to be in the high risk group for TORCH pathogens[7]. Primary infections of toxoplasmosis, CMV, rubella and HSV during pregnancy can bring wide ranges of clinical symptoms dependent on the stage of pregnancy.

TORCH infections during the early stages of pregnancy may result in congenital malformations, intrauterine growth restriction (IUGR) or fetal death [8].

Rubella infection during pregnancy has a devastating consequence; defined as congenital rubella syndrome (CRS). Miscarriage and stillbirth is the most important sequel of CRS [9]

Material and Method

Subjects:

This study was performed among 68 pregnant women collected from maternity unit at Al-Yarmook teaching hospital in Baghdad, Iraq, from 2018 to 2019. These samples were categorized into two groups, first group include 34 women with spontaneous abortion the other 34 women with normal delivery were enrolled as the control group. A questionnaire including demographic, epidemiological criteria and clinical symptoms was recorded in both the case and control groups by interview.

Five milliliters of venous blood samples were collected from each pregnant woman. Serum were separated from the blood samples and stored at -20°C until use.

Serological evaluation

Specific IgG and IgM antibodies to *Toxoplasma gondii* and Rubella were measured by the Enzyme-linked immunosorbent assay, with commercial ELISA kits (ab108778 –Anti-Toxoplasma gondiiIgM) according to the manufacturer’s instructions and the optical density (OD) was read at 450 nm by the spectrophotometer ELISA reader (Awareness Technology INC Stat Fax-2100). Diagnostic criteria IgG and IgM was defined the upper limit of the standard 10 U/mL (Cut-off).

Nucleic acid extraction

DNA and RNA were extracted from *Toxoplasma gondii* and Rubella, respectively using (RIBO-sorb, K2-1-Et-50-CE, Italy) according to the manufacturing procedure.

RT-PCR for detection of viruses

Both viruses *Toxoplasma gondii* and Rubella were detected by using commercial RT-PCR kits that allow the qualitative detection of viral nucleic acids in plasma, *Toxoplasma gondii* Real-TM (Sacae, CAT#TP1-50FRT, Italy) for *Toxoplasma gondii* and Real-TM Qual (Sacace, CAT#V24-50FRT, Italy) for Rubella.

Statistical Analysis

All data were analyzed by SPSS version 11.5 (SPSS, Chicago, IL, USA) using Fisher exact test. The odd ratio (OR) and *P*-value were also calculated

Results

The difference in age between case and control groups wasn’t statistically significant, As shown in Table 1. Also the contact with cats showed no statistically significant differences

Table (1): The difference in age between case and control

Risk factors	Variables	Case (n = 34)	control (n = 34)	P-value
Age	<20	2	1	0.5
	20–40	29	30	
	>41	4	3	
Contact to cat	yes	9	7	0.6
	no	25	27	

Toxoplasma gondii IgG antibody was detected in 19 (55.8%) of case and 11 (32.3%) of control group (OR=1.23, P=0.5). Rubella IgG antibody was detected in 75.3% versus 86.7% in case and control groups (OR=0.46, P=0.05).

Table (2): The comparison results *Toxoplasma gondii* IgG antibody and Rubella

Infection type	Case	Control	OR	p-value
<i>Toxoplasma gondii</i>	19 (55.8%)	11 (32.3%)	1.23	0.53
Rubella	25 (75.3%)	29 (86.7%)	1.4	0.32
<i>Toxoplasma gondii</i> + Rubella	16 (47.0%)	2 (5.8%)	4.6	0.001

The detection of both viruses were also done by using RT-PCR and the resulted curves showed in figure-1 and the resulted data were compared to data obtained by using ELISA detection method. The comparison results summarized in table-2.

Figure 1:- resulted RT-PCR curves of Rubella and Toxoplasma detection.

The detection by using RT-PCR reported to be more sensitive than serological method as this method based on molecular detection of the active viruses. The results were summarized in table-3. 25 case subjects (with continues abortion) infected with rubella detected by ELISA were minimized to 20 sample after re-tested by RT-PCR and 29 control subjects minimized to 3 only this comparison were highly significant. While the infection with toxoplasma were recorded in 19 case subjects by ELISA minimized to 14 by RT-PCR and 11 control subjects to only 5 only this were also highly significant. The statistical test were done by ANOVA two way .

Table (3): The correlation between Rubella and toxoplasmos

Groups	Case		Control		p-value
	RT-PCR	IgM	RT-PCR	IgM	
Rubella	20	25	3	29	0.001
Toxoplasma	14	19	5	11	0.008

The correlation between Rubella and toxoplasmosis summarized in table--3 showed that 14 of the patients with Toxoplasmosis were also infected with Rubella and only 3 cases were infected with Rubella without the infection with toxoplasma. While the 20 subjects infected with rubella without toxoplasmosis infection and 21. These data showed significantly ($p=0.022$) high odd ratio= 4.9 (C.I.= 1.26 to 19

Table (4): Risk for congenital rubella syndrome increases when infection occurs in early stages of pregnancy

		toxoplasmosis		p-value	odd	
		infected	non-infected			
rubella	Infected	14	6	0.022	4.9	1.26 to 19.13
	non-infected	3	21			

An estimated 5% of couples attempting to have a baby experience recurrent pregnancy loss. Recurrent pregnancy loss is often defined as 3 or more consecutive miscarriages. There are many reasons a woman might miscarry, but in the past very few diagnoses were given or made known to the mother. Recent studies have shown that approximately 10

to 15% of all first time pregnancies end in miscarriages. The studies also suggested that a similar miscarriage rate could be expected for future pregnancies. [10]. Jaslow CR et al (2010) [11] and Rai R, Regan L.(2006) [12] found there is significant relationship between history of miscarriage in the family and the studied group this is may be estimated to be due to the life style in the family and their health status these studies agreed with the current study.

Risk for congenital rubella syndrome increases when infection occurs in early stages of pregnancy. Specifically, the percentage of infants with congenital malformation exceeds 50% in cases of infection during the first trimester of pregnancy while the relative percentage is significantly reduced after the 20th gestational week [13],[14],[15],[16],[17]. However, maternal viremia is not a proof of vertical transmission to the embryo, and fetal infection does not necessarily correspond to fetal damage. Namaei et al. reported that none of the infants of gravidas that received a measles-rubella vaccine at the interval between 3 months before and 3 months after conception appeared to experience viral consequences. This may be the reason why authors support detailed information provided to the mother in order to prevent unnecessary voluntary interruption of pregnancies [14,18].

Prenatal diagnostic exploration should be recommended in case of positive PCR in order to detect the affected embryos, having more precise information concerning the fetal health status before the decision of pregnancy's termination [19,20,21,22]. Studies have demonstrated an association between viral load in amniotic fluid and the risk of a symptomatic infant, whereas further investigation with a noninvasive diagnostic procedure might postulate a method to evaluate potential fetal affection [22,23,24,25].

Serological tests results by ELISA were not specific and may give false positive results that could be explain by chances of infection with other microorganism and that's also confirmed by the results as few of the results obtained by ELISA were confirmed by PCR [26]. In addition, The results obtained in Al-Najaf indicates that the percentage of Rubella IgG was 49.12% and that revealed less than the result recorded by Lenochove in Turkey [27].

Serological results obtained by Thikra [28]. revealed 12 out of 57 patients were IgM and IgG for Rubella

and after test them by PCR, only (50%) of results were positive. And this result agreed with Nolan [29], whose approved that out of 18 positive cases of Rubella by ELISA only 7 were positive by PCR. Our results revealed seropositive IgG for Rubella and Cytomegalovirus percentage were 49.12 % and 70.2% respectively. After PCR test has done the results percentage has declined to 10.53 % in Rubella virus, and this lead to real incidence of infection of this microorganism and reflect the false positivity of the routine ELISA test [30]. In addition, Toxoplasma gondii and Rubella both are considered non-active infections in human being with continuous mini foci that may lead to immune response state. Antigenic diversity in viruses may add another explanation to give false positive results in ELISA [31].

A small number of countries in Asia have a Rubella-containing vaccine in their national immunization programs. At the moment, control of Rubella through vaccination has been achieved only in Japan, Taiwan and Singapore. Rubella therefore remains poorly controlled in many Asian countries. Data from 2009 shows that, in the Southeast Asian continent, the vaccination coverage rate is only (4%) [32], while in Iraq, the vaccination coverage was 67.6% and 88% as demonstrated in retrospective and prospective study respectively [33]. Various vaccine strategies have been used the world over to mitigate Rubella infections. As inoculation is now well received, vaccination programs strive to immunize all young people before the onset of puberty using a two-stage Rubella vaccination. In the event of a negative result, there is a chance of being immunized during the early stages of pregnancy which lead to specific IgM being detected [34].

Conclusion

After representing these results we conclude that co-infection with both Rubella and Toxoplasma infection might increase the risk of miscarriage and we showed the sensitivity of molecular test and specially the RT-PCR is significantly sensitive than the serological test.

Flexible Ureterorenoscopy Versus Extracorporeal Shock Wave Lithotripsy for Treatment of Lower Pole Renal Stones

Mohammed B. Ismail,¹ Hasanain F. Hasan Al-Timimi,² Hayder H. Alwan³

¹Lecturer, CABMS (Urology), College of Medicine/University of Baghdad, ²Ass. Prof, FICMS (Urology), SNBHW (Urology), College of Medicine / University of Baghdad, ³M.B.Ch.B, Resident Doctor in Department of Urosurgery in Ghazi Al-Hariri Surgical Specialists Hospital/Medical City Complex

Abstract

Background: Urolithiasis affects 5-15% of the world population, with high recurrence, (2) which at 5 years can be up to 50%, with high frequency in the labor force population, which produces a high individual and hospital cost, so it constitutes a health problem of high socio-sanitary interest. **Objective:** To compare the treatment outcomes of Flexible ureterorenoscopy and extracorporeal shock wave lithotripsy for patients with lower pole stones. **Patients and method:** Data base review for the patients in the period from first of Jan 2018 to the end of June 2019, in which 131 patients underwent interventions for the management of small lower pole stone. Sixty-seven patients were treated by ESWL and the rest (64) treated by F-URS. The most common complication was UTI 9/19 **Results:** 86/131 were male and 45/131 were female with mean age for F-URS group (52±9.7 years) and (49.6±12.3 years) for ESWL group, with highly significant differences regarding the stone size between the studied groups. The treatment rate, operative time and procedure per patient were highly significantly decrease in F-URS group than in ESWL (p<0.001). Moreover, significant association were notice between the studied groups among SFR at 3 months and secondary procedures. **Conclusion:** lower pole renal stone in size between 10-20 mm treated successfully and more efficiently by F-URS in comparison with ESWL.

Keyword: Urolithiasis, Flexible ureterorenoscopy, extracorporeal shock wave lithotripsy, lower pole stone,

Introduction

The ideal management of renal stones of the lower calyces still continues in controversial discussions and is a dilemma for the urologist. No single method is suitable for removing all stones of the lower calyces. The aim of lower calyceal stones management is to achieve maximum stones clearance with least morbidity. Recently developed minimally invasive procedures have superseded open stone surgery. Extracorporeal shockwave lithotripsy (ESWL), percutaneous nephrolithotomy (PCNL), and flexible ureteroscopy are the presently used therapeutic methods⁽¹⁾. Urolithiasis affects 5-15% of the world population, with high recurrence,⁽²⁾ which at 5 years can be up to 50%, with high frequency in the labor force population, which produces a high individual and hospital cost, so it constitutes a health problem of high socio-sanitary interest⁽³⁾. The increase in the prevalence of urinary lithiasis has been considerable in recent decades, generating an increase in spending on health systems⁽⁴⁾.

The **first flexible ureterorenoscope** (F-URS) was used in 1983, developed by Bagley et al., Giving way to a number of technological advances, until the design of current equipment was achieved with a decrease in caliber associated with a wide working channel that allows use multiple instruments simultaneously, achieving active deflection at its distal end. Likewise, improvements in resolution have been incorporated to achieve a high definition digital image^(5,6).

There is a clear and linear relationship between the number of cases and the decrease in surgical times, complication and success rate; however, the complications associated with the use of F-URS remain a matter to be taken into a consideration. Among the complications described is the avulsion of the ureter, with an incidence of 0.5%, which has been decreasing since the beginning of the use of the F-URS, the intussusception of the ureter (defined as the folding of a tract of an organ hollow within the same organ), due

to a circumferential lesion in the wall of the same. This complication has been associated with the presence of fibro epithelial polyps and transitional cell neoplasms; however, the incidence is so low that it cannot be estimated in the available literature. Ureter perforation is another frequent complication with an incidence ranging from 0 to 15.4%. False routes are another frequent complication that occurs when an instrument pierces the ureteral mucosa without penetrating the total thickness of the ureter wall. Its incidence is low and ranges between 0.4-0.9%. Finally, one of the most feared intraoperative complications is the damage or malfunction of the instruments, however, today this complication has become more anecdotal and the incidence is close to 0%. Among these factors are the malfunction of the laser fiber tip, the breakage of the fiber inside the ureterorenoscope and the breakage of the extractor basket ⁽⁷⁾.

Extracorporeal shock wave lithotripsy ((ESWL) is the most frequently used treatment modality due to ease of use and great acceptance by the patient ⁽⁸⁾. The great success in fragmentation and the minimum rate of complications, associated with its non-invasive and frequently ambulatory condition, explain that it still displaces widely all other therapeutic alternatives in urinary lithiasis⁶ with approximately 80-85% of the initial indications, ⁽⁹⁾ especially for non-complex calculi of the upper urinary tract, their resolution rates range from 33 to 97% ⁽¹⁰⁾.

Aim of the study: To compare the treatment outcomes of Flexible ureterorenoscopy and extracorporeal shock wave lithotripsy for patients with lower pole stones.

Patients and method:

Data base review for the patients in the period from 1st of Jan 2018 to the end of June 2019, in which 131 patients underwent interventions for the management of 10-20 mm lower pole stone. 67 patients were treated by ESWL and the rest (64) treated by F-URS.

All patients underwent CT scan preoperatively to determine the size and location of the lithiasis, as well as the assessment of the approach using URS Flex.

Technique

The patient's position should not be a very forced lithotomy to facilitate the passage of the protective

sheath and the F-URS in a simple way and as straight ahead as possible.

We usually start with the passage of a guide wire through the ureteral orifice until it reaches the renal pelvis or upper calyx and visualize the lithiasis with fluoroscopic control.

Subsequently, and through the guide wire, we pass a dilatation balloon catheter to dilate up to 15 Fr from the ureteral orifice to the iliac ureter in cases where necessary. This is due to the fact that the protective sheath usually has an external caliber of 13-14-15 Fr although the new thinner Flexible URSs allow a smaller caliber.

After dilating the ureter to the iliac junction, we will perform a retrograde ureteropyelography that helps us subsequently control the passage of the protective sheath of the F-URS that we use in all cases.

The protective sheath will be passed on the guide wire and will be housed in the renal pelvis. Subsequently we remove the obturator of the protective sheath with the guide wire, leaving only the protective sheath in renal pelvis and the bladder catheter.

The use of the protective sheath of the F-URS, which we use in all procedures, will not only help us improve visibility, maintain low intra renal pressures or facilitate the extraction of fragments, but also considerably lengthens the half-life of the F-URS Flex and it represents a considerable economic saving.

Once we are with the F-URS inside the renal pelvis, we will try to locate the lithiasis and direct it with the help of a basket to a location that allows us to work in a straight line as a superior calyx or renal pelvis.

Working in locations other than the lower calyx is not only important for comfort during litho fragmentation by working in a straight line, but also makes it easier for residual lithiasic fragments that may remain to be expelled spontaneously more easily.

The caliber of the laser fibers used can be 220 microns. This fiber does not allow you any degree of flexion and forcing it can favor F-URS breaks.

The 150-220 fiber allows you all the degrees of flexion that your F-URS has, better visibility by limiting less the wash flow with the counterpart of being able to use less laser power and greater fragility and ease of

fiber breakage with its additional cost.

The fiber of 220 microns is the one that we use in most cases, it limits you very few degrees and being of greater diameter, allows you greater contact area with the lithiasis and therefore the fragmentation of the lithiasis will take less time in addition to resist greater lithotripsy power and be a fiber more resistant to breakage by handling it. It is important to avoid as much as possible a blood medium since the F-URS washing channel and its flow do not allow a good visualization.

If this happens, we must increase the pressure of the inlet flow without fear of raising intra renal pressures because we always use the protective sheath of the F-URS and maintain a constant intra renal pressure.

Although we use a gravity irrigation system, on certain occasions we use a manual pressure increase using a 60 ml syringe connected to the URS Flex using a saline serum system.

Once the lithotripsy is finished, for which we start with 0.8 J and 6 Hz and we increase the energy of the laser depending on the hardness of the lithiasis, we must with the help of nitinol baskets without tip, extract the larger fragments through of the protective sheath avoiding the use of tweezers through the Flex URS that can favor its breakage.

ESWL Technique:

Patients were took analgesia by diclofenac injection.

In about 3000 shocks (80 shocks/minutes) in each session or we continue until the stone was completely crushed. Evaluation of the patients post ESWL by K.U.B. if stone radio opaque and ultra sound if stone is radiolucent to see if there is residual stone. The treatment may reach 3 sessions if there is observation of stone with inadequate fragmentation

Follow up:

After 3 months, urography or Uro-CT scan were done to the patients to see the outcome. At this time we can assess whether or not there is residual lithiasis and whether they require any type of treatment or not according to their condition. We compared between F-URS and ESWL regarding the treatment and complications rate, SFR, secondary and total number of procedures and duration time of operation.

Results

131 patients with lower pole renal stone with size 10-20 mm were enrolled in the current study, 86/131 were male and 45/131 were female with mean age for F-URS group (52±9.7 years) and (49.6±12.3 years) for ESWL group, with highly significant differences regarding the stone size between the studied groups. No significant differences were found between the studied groups regarding gender, side of stone, previous treatment of stone, opacity, age, and BMI of the patients (table 1)

Table 1: Pretreatment and demographic data of studied patients

N	F-URS (n=64)		ESWL (67)		P-value	
	%	N	%			
Gender	Male	43	67.2	43	64.2	0.8
	Female	21	32.8	24	35.8	
Side of stone	Right	30	46.9	31	46.3	0.9
	Left	34	53.1	36	53.7	
Previous Rx. of stone	URS	3	4.7	5	74.6	0.3
	ESWL	8	12.5	8	11.9	
	PNL	9	14.0	3	4.5	
	Open	2	3.1	3	4.5	
Opacity	Opaque	52	81.3	57	85.1	0.7
	Lucent	12	18.7	10	14.9	
Age (mean± SD)		52±9.7		49.6±12.3		0.2
BMI (mean± SD)		28.6±2.3		29.3± 3.5		0.1
Stone size(mm) (mean± SD)		15.3±1.5		14.2±2.1		<0.001

Table 2 show that there is no significant differences were found between the studied groups among stone H. density

Table 2: Association between the studied groups among H density

HD	F-URS (n=64)		ESW (n=67)		P value
	N	%	N	%	
> 1000	23	36.0	23	34.0	0.9 NS
<1000	41	64.0	44	66.0	

As shown in table 3, the treatment rate, operative time and procedure per patient were highly significantly decrease in F-URS group than in ESWL (p<0.001). Moreover, significant association were notice between the studied groups among SFR at 3 months and secondary procedures.

Treatment and post-treatment data for the studied patients

No.	F-URS (n=64)		ESWL (n=67)		P-value	
	%	No.	%	No.		
Retreatment rate	5	7.8	41	61.2	<0.001	
Stone-free rates (SFR) at 3 months	53	82.8	47	70.1	0.008	
Secondary procedures	ESWL	5	7.8	0	-	0.004
	F-URS	0	-	7	10.4	
Operative time (min)	75±31		96±36		<0.001	
Procedures per patient	1.3±0.7 Range (1-2)		2.2±1.4 Range (1-5)		<0.001	

The most common complication was UTI 9/19 (four patients in F-URL group and five patients in ESWL group), eight patients presented with severe pain (5 patients in F-URL group and 3 in ESWL group), and two patients presented with gross hematuria one in each group (figure 1).

Figure 1: Complications

Discussion

Patients and physicians like highly the ESWL way for treatment of renal stone as it is non-invasive procedure despite lower SFR and high percentage of retreatment procedures^(11,12), which is considered by many of them (physicians) as first line renal stone treatment.^(13,14,15)

In spite of highly significant increase of the stone size in F-URS group than that in ESWL group we noticed that the retreatment rate were highly significant decrease in first group which is considered as most important finding in the current study.

SFR at 3 months were better in F-URS technique than that by ESWL with significant association, while in a study carried by Kumar A et al, the SFR at 3 months were better in F-URS (86.6%) than that in ESWL (82.2 %) but with no significant association^(16,17). Moreover, it is similar to that found by Pearl et al, but with no significant differences⁽¹²⁾.

In the present study we found that urinary tract infection is the common cause of complications in ESWL and sever pain in F-URS, while in study carried by Kumar A et al, the common complication found in ESWL was sever pain and UTI in patients treated with F-URS.

In a Cochrane analysis, study carried by Srisubath et al (2009) revealed that in three ways of renal calculi stone treatment the ESWL had the lowest efficacy than PCNL and URS but with no significant differences. Moreover shorter period of stay in hospital were found in ESWL than other two procedures, and these three treatments (ESWL, F-URS, and PCNL) looked to offer a good chance of rendering the patient stone free in one session⁽¹⁸⁾.

Conclusion

Lower pole renal stone in size between 10-20 mm treated successfully and more efficiently by F-URS in comparison with ESWL.

Conflict of Interest: None declared.

Abstract

Background: Worldwide, numerous people are affected with the infertility problem. Especially married people find it the most stressful problem that can also cause psychological issues. Glutathione is a naturally produced oxidant that is quite useful to preserve other antioxidants. The level of glutathione varies from person to person. It plays a significant role to enhance the sperm motility pattern. Some men who are suffering from infertility problem because of andrological pathologies, the glutathione can eliminate such issues because of therapeutic effect. Men, who have a lower amount of Q 10 in the seminal fluid, experience the slow motion of the sperms. According to various studies, the increase in the quantity of Q 10 automatically enhances the motility of the sperm.

Material and Method: The presented prospective randomized placebo-controlled study was conducted in Saladin province of Samarra city (Iraq) between Jan 2016 to Dec 2018. The study deployed 51 infertile male subjects for the administration of oral glutathione (250mg sachets) for tenure of 6-months. Another group of patients 50 received oral Co-enzyme q 10 (200 mg sachets) for 6 months, a third group received a placebo (sugar sachets) for another 6 months.

Results: The results revealed oral glutathione and co-enzyme q 10 as an effective treatment for improving the sperm parameters (motility, morphology, sperm concentration) which were statistically significant except for semen volume where P value was > 0.05 . Also, this study showed no statistical significance between the use of glutathione and co-enzyme q 10 as a single agent therapy ($P>0.05$).

Outcomes: From this study, we can conclude that both glutathione and co-enzyme q 10 are effective treatment options for improving sperm motility, morphology and concentration

Key words: male infertility, glutathione, co-enzyme, Q10, sperm motility

Introduction

With the passage of time, the infertility rate is being increased in males. There are various reasons for infertility problem. According to the current estimation,

15% of couples are facing infertility problem around the world. Most of the time, there is not a single reason has been identified as infertility. About 20-30% of the infertility cases are identified in males. The major cause of infertility in males is associated with sperm disorder. Some other causes include genetic defects, undescended testicles, and various health issues, i.e. HIV, gonorrhea, mumps, and chlamydia. Infertility in males can be diagnosed with different signs and symptoms (1). Different men exhibit different signs and symptoms. For instance, some show variation in the sexual desires that are directly related to the health of fertility. Some experience pain and swelling in the testicles. An erection

problem is also common in males who are suffering from infertility (2). Presently, male infertility can be treated with the help of medication by diagnosing the core reason for infertility such as erectile dysfunction or hormonal imbalance (3).

Glutathione is present in the cells of mammals and it is a tripeptide thiol, which is a non-protein sulfhydryl compound. It consists of three amino acids named glutamine, cysteine, and glycine. During the oxidative stress, the glutathione uses the power by the cells to act as a defensive appliance against oxidative destruction. There are two types of Glutathione, i.e. GSH and GSSG. Glutathione is present not only in somatic cells but also in germ cells. The defensive mechanism is consist of enzymatic and non-enzymatic functions, characterized by the Glutathione. In males, the deficiency of Glutathione results in the dysfunction of the central part of the sperm that ultimately results in the defective sperm movement. Glutathione protects the spermatozoa plasma membrane by forming a protective layer (4). As per previous researches, it is proven that Glutathione has the ability to maintain the biological importance of the germ cells (5). Men, who are suffering from genital tract inflammation, unilateral varicocele, and sperm dysfunction can be cured with the help of Glutathione.

The coenzyme Q 10 is a nutrient produced in the body in a natural way. It is also present in different food items. The main function of the Coenzyme Q 10 is that it performs like an antioxidant. It defends the cells of the body from any destruction and plays a key role in metabolism (6).

In the initial studies, many researchers have found that coenzyme Q 10 supplementation is quite beneficial to treat the infertility problem in males. Some males are suffering from low sperm count. It not only helps to increase the sperm count but also enhances the mobility so the sperms become efficient enough to enter the egg. About 200-300 mg Coenzyme Q10 intake is beneficial to eliminate infertility problem (7). With the help of Coenzyme Q 10, the sperm quality becomes better.

Aim/Objective

The aim of the present randomized placebo-controlled study is to identify the efficiency of Glutathione and Coenzyme Q10 in increasing the sperm motility rate. The quantitative research enhances the possibility of the Glutathione and Coenzyme Q10 efficacy related to motility, morphology, and concentration of the sperms.

Background Literature

According to various studies, male fertility is improved by the effect of ubiquinone. The motility, morphology, and concentration of the sperms get better with the help of Coenzyme Q10 action in an oxidized form. The reduced form of Coenzyme Q10 characterizes around 90% of the Coenzyme Q10. As per different experimental results, it has been noted that the low dose of Coenzyme Q10 that is 90mg per day for a duration of 12 weeks is quite effective to enhance the quality of sperms (8).

Another research revealed that the high dose of Coenzyme Q10 that is 300 mg per day for about 12 weeks is effective enough to treat the infertility issues in males because it has a powerful effect of antioxidant. According to the research conducted by Gyozdjaova, it has been revealed that the combination of carnitine and ubiquinol is very effectual to treat the male infertility problem by increasing the function of mitochondria in the sperms (8).

A randomized placebo-controlled study was conducted to observe the effect of Coenzyme Q10 on sperm concentration. It has been observed that the Coenzyme Q10 has a protective effect and it acts as a shield against oxidative stress to enhance the morphology as well as the concentration of the sperms. It took duration of 3 months to get significant outcomes. Another research was conducted by Nadjarzadeh, it is based on a double-blind placebo-controlled experiment. It has been observed that Coenzyme Q10 has no significant effect on sperm quality or concentration (9).

In human beings, the low quantity of the glutathione in the seminal fluid leads to the abnormality of the sperms because of the low level of glutathione ultimately unstable the middle portion of the sperm that effects the motility rate of sperms (10). The high dosage of Glutathione 600mg per day is proved to be effectual enough to treat the infertility disorder in males (9).

In the study conducted by Yarosh and colleagues, the role of glutathione S-transferase has been observed in idiopathic male infertility. There were three gene polymorphisms have been selected that include GSTM1, GSTT1, and GSTP1 to analyze their effect on the Russian men who are suffering from idiopathic infertility. 203 samples of DNA were collected from 203 infertile males and 227 DNA samples were collected from 227 fertile males. The PCR-Restriction Fragment Length

Polymorphism technique was applied in the research. It has been noted that GSTMI, GSTT1, and GSTP1 genes are responsible to develop idiopathic infertility in men⁽¹¹⁾. It has been noted that smoking is the major cause of its phenotypic effect that can be associated with the risk of infertility disorder.

Material and Method

Participants

The present randomized placebo-controlled clinical trial was conducted in Saladin province of Samarra city (Iraq) between Jan 2016 to Dec 2018. The study deployed 51 infertile male subjects for the administration of oral glutathione (250mg sachets) for 6-months. Another group of patients 50 received oral Co-enzyme q 10 (200 mg sachets) for 6 months, a third group was taken a placebo (sugar sachets) for another 6 months. All patients included in this study were of a normal female factor with idiopathic oligoasthenoteratozoospermia, patients with a chronic disease like mumps, hydrocele, neoplasm, trauma from prolonged riding, hypospadias, vas deference obstruction, varicocele, and genital tract infection were excluded from this study, also those who received treatment recently. Patients were from 30-40 years old. Before the start of the study, semen samples were taken for all three groups for baseline assessment. Another assessment was done at the end of the 6 months period. All samples were given to a lap. Within 20

minutes, the interpretation was done in accordance with the WHO 2010 criteria⁽¹²⁾, semen morphology was done according to Kruger criteria⁽¹³⁾. Data analysis was undertaken through SPSS 23.0 in the windows interface. Mann Whitney U-test, Kruskal–Wallis test, and chi-square test were used when needed for assessing the data significance for P value <0.05.

Informed Consent

Informed consent was obtained from all study subjects while categorically explaining them the interventions, objectives, and concerns. After taking the informed consent of the research participants, the data were collected.

Semen samples were taken for all three groups for baseline assessment. Another assessment is done after the end of six months duration. Semen morphology was performed as per Kruger criteria. Moreover, the precipitation and centrifugation were carried out to assess the seminal plasma of Glutathione and Coenzyme Q10 with the help of Ellman technique.

Several interactive interviews were conducted to get the informed consent of the participants of the current research. Some of the essential data were collected from the participants while taking the interview that includes age, marriage time, job type, and social habits.

Results

Table (1) showing the characteristic of patients before start of therapy:

Domains	Co-enzyme q 10 group (n=50)	Glutathione group (n=51)	Placebo group (n=50)	P value
Age (years)	32.2±10.2	31.4±11.6	30.1±7.6	>0.05
% of normal Motility (grade a+b)	28	26	28	>0.05
Sperm Concentration (million per ml)	50.4±12.3	50.2±10.1	51.5±8.2	>0.05
% of normal Morphology (kruger criteria)	10	12	10	>0.05
Semen Volume (ml)	2.24±1.23	2.25±0.85	2.21±0.92	>0.05

This table shows that there is no significant statistical difference among study parameters before the start of the study.

Table (2) showing percent of improvement of semen parameters at the end of the study after 6 months of different treatment interventions.

Domains	Co-enzyme Q10 group (n=50)	Glutathione group (n=51)	Placebo group (n=50)	P value
% of motility improvement	36	38	4	P=0.01
% of morphology improvement	28	24	6	P=0.03
% of concentration improvement	24	26	2	P=0.01
% of volume improvement	6	4	4	P>0.05

This study outcome revealed oral glutathione and co-enzyme q 10 as an effective treatment for improving the sperm parameters (motility, morphology, sperm concentration) which were statistically significant except for semen volume where P value > 0.05. Also, the study showed no significant statistical difference between the use of glutathione and coenzyme q10 as a single agent therapy (P >0.05)

Discussion

The infertility problem in men is because of defective mobility, concentration, and morphology of sperms. Such types of factors are very susceptible to the free radicals that are oxygen molecules and consisted of one or more additional electrons. As per statistics, around 25% of the males are affected with the infertility issues worldwide. There are various reasons that affect the spermatogenesis process such as nutrition, environment, genetics, and physiological issues ⁽¹⁾.

A study conducted to treat the Iraqi infertile men. In the study, around 60 males were selected. The semen was obtained from the participants and it was divided into three categories. The first category is in vitro sperm characterization, the second category utilized density gradient centrifugation technique and in the last category, the combination of density gradient centrifugation and TAD 600mg Glutathione is used ⁽¹⁴⁾. It has been concluded that TAD 600mg Glutathione had a very positive effect to enhance the quality and function of sperms.

Another study was conducted by Trang and his colleagues; the idiopathic male infertility was analyzed in the Vietnam males. 300 blood samples were collected in which 150 were control samples and 150 were infertile samples. The aim of e research is to identify two common SNPs that are associated with infertility. It has been revealed that NAT2 and GSTP1 are susceptible to cause infertility in males ⁽¹⁵⁾. Such genetic markers will be useful to investigate the cause of infertility in future researches. Research accompanied by the Kolesnikova and his colleagues. They have observed the Glutathione effectiveness on the men who are suffering from infertility issue. It has been found that a balanced amount of Glutathione is essential for proper functioning ⁽¹⁶⁾. Without a balanced quantity of Glutathione, the detoxification of toxic substances will not be possible. To cure infertility in men, it is better to balance the glutathione level in the body. The study conducted by Sinha in 2018 to analyze the role of antioxidants in male infertility, it has been revealed that glutathione has a promising effect as a defensive mechanism ⁽¹⁷⁾. It has the ability to cure the reproductive damage that is caused by ROS.

According to the research carried out by Ring and his colleagues, the contribution of the male infertility issue is about 50-60% in whole infertility. In most of the cases, the abnormal semen results in the infertility problem in males. The efficiency of the Coenzyme Q10 has been proved to play a major role to treat the males' infertility ⁽¹⁸⁾. The supplementation of Coenzyme Q10 is very effective to treat sperm concentration and quality.

A small study conducted in which azoospermic males were selected for the experiment. 183 patients were selected for the study. It has been observed that coenzyme Q10 has a quite positive effect on the experimental group who were treated with coenzyme Q10⁽¹⁹⁾. The motility and morphology of the sperms were enhanced significantly after getting the treatment. The current study indicates the significant improvement in the quality, quantity, morphology, and concentration of sperms with the treatment of glutathione and coenzyme q10.

Conclusion

From this study, we can conclude that both glutathione and co-enzyme q 10 are effective treatment options for improving sperm motility, morphology and concentration. There is no statistical difference between them as a single agent therapy; the researchers need to investigate the scope of co-administering other antioxidants like carnitine, selenium, and vitamin B complex with oral glutathione or co-enzyme q 10 to minimize the prevalence of male infertility in the selected population.

Incidence and Variations of Aberrant Renal Arteries in Kidney Donors Cases

Mustafa AbdulMonamZainel¹, Suhelmawloodalnajjar¹

¹Department of Anatomy, Hawler Medical University, College of Medicine. Iraq, Irbil

Abstract

The origin of renal arteries, vessel diameter, and point of entry to the kidney has all been analyzed as potential parameters which are a clinically relevant issue. This anatomical feature may be essential for fully understanding the process of renal perfusion, as it is not only the number of renal arteries that influences the extent of renal blood supply, also their diameter. The aberrant renal arteries that supply the inferior pole are more important because it provides arterial supply to the proximal part of the ureter. The objective of this study is to identify influences and prevalence of aberrant renal arteries of the kidney donors' cases to perform role of the aberrant renal artery.

Prevalence of aberrant renal artery was identified in 26.3% of the cases, incidence was more frequent in left than right side; about 78.7 % of cases presented unilaterally. The remaining cases 21.2 % were RAs presented bilaterally. Diameter of main RA in kidney presenting the RA was 5.73 mm and that of kidney with only single renal artery was 6.19 mm.

Keywords: Aberrant renal artery, renal arterial variations, renal angiography, kidney, incidence.

Introduction

As a wide range of renal vascular variations has been reported by anatomists and radiologists; prevalence of these variations is extremely divergent in various populations. Historically, first recorded aberrant renal artery (aRA) was reported by Eustachius ^[1] in one of his famous plates which remained unprinted in Papal Library until 1714. Since then various cases of aRA have been reported; including variations in origin, number, and branching pattern of renal arteries ^[2&3]. Therefore, as much as larger samples studied will give more clarifications and changes ^[3].

aRA defined by presence of more than one renal artery (RA) supplying kidney which may arise from aorta; above or below of main RA ^[2, 4&5], or may arise from coeliac, superior mesenteric ^[2], inferior mesenteric, and common iliac arteries ^[2&3]. name "aberrant" described in literature whereby additional artery branches from abdominal aorta either superior or inferior to main RA and enters kidney directly through the capsule at the upper or lower poles of the kidney, or as "accessory" whereby it enters the hilum directly. Anatomical variants in the renal vasculature considered

being extremely common variants ^[1, 6&7]; the prevalence of aRAs are found in 30% (ranging 20-30%) of the individuals ^[2-5].

Embryologically, as the kidneys ascend from the pelvis during the embryological development, they receive their blood supply initially from common iliac arteries. Later, they receive new branches from the aorta, and the inferior branches disappear. This continuous generation and degeneration of renal arteries as the kidney ascend explains the high incidence of the variations in the blood supply to the kidneys. Therefore, the complicated embryology variations of this organ are relatively higher when compared with the others ^[8&9].

The main objectives and aims identify the prevalence and variation of the aberrant renal arteries of the kidney donors' cases, as they had been regarded as perfect normal cases for the study. Determine the anatomy and topography of the aberrant artery and main renal artery donor kidneys and preserving total donated kidney function.

Material and methods This study was designed to determine the main RAs and aRAs including its morphometric and location on each side in kidney

donors. A double-blinded prospective and retrospective angiographic and morphometric imaging study performed on one hundred and eighty-four (184) potential prospective living kidney donors. This study was conducted from December 2018 to May 2019 at the radiology and imaging centre in Zheen International Hospital in Erbil city, Iraq. Only the cases that fit for the donation were selected medico-legally. This study was approved by the research ethics committee of the college of medicine, and written consent was received from the cases. Regarding the contrast media allergy cases, no hypersensitivity cases were recorded, other than some simple cutaneous rashes in two cases which need no interferences.

Computed Tomographic Angiographic (CT-Angiographic) imaging for the cases performed according to the four-phase protocol; which include an initial non-contrast image acquisition phase, followed by arterial phase, nephrographic phase, and excretory phase (delayed phase). The perfect anatomic coverage for CT-Angiography was extended between the dome of the diaphragm and the distal portion of the common iliac arteries or pelvic region. The dynamic CT-Angiography examination was performed with a 128-slice CT scanner (Somatom Definition AS+ 2012, SIEMENS Healthcare, and Germany) such that four phases were covered.

Finally, all images were reconstructed and analyzed by Syngo program (Siemens Healthcare, Germany). In 3D CT-Angiography, the VRT, MRP and MIP images were used for evaluation of the renal arteries. Regarding the RAs morphometry (diameter); retrospective analysis of the RAs of all the kidney donors was carried out in a double blinded fashion and measured at the aortic origin. To carry out the analysis of renal arteries variations and diameter based on the type of arterial blood supply present, the total number of the kidneys and arteries were established and then divided into different groups according to the following criteria; Gender, Side, Anatomic eRA – early branch renal artery, a single renal artery originating from the aorta and giving branch before reaching renal hilum and supplying poles, hilum of the kidney, and extra renal organs.

Statistical Analysis

Statistical analysis of the current study data was done by using social package for scientific statistic (SPSS) software version 24 (IBM Corporation, Armonk, New York, USA).

Result: The CT-Angiographic findings analyzed in one hundred and eighty-four (184) cases i.e. three hundred and sixty-eight (368) bilateral kidneys were enrolled in this study. Cases are distributed between 128 males and 56 females. Participants' age ranged between 19-61 years for males and 19-58 years for females. The mean age of males is (24.05 ±6.4) years, and the females mean age is (28.12 ±7.9) years; which there are no statistically significant differences between these two groups (t-test, P= 0.961).

The incidence of only single RA is identified in 271 (73.64%) out of 368 kidneys. Whereas the renal arterial variations i.e. aRA were identified in 97 (26.3%) out of 368 kidneys.

Accordingly, the incidence of aRA on the right side is 38 (20.7%) out of 184 kidneys. While on the left side, the incidence is 59 (32.1%) out of 184 kidneys. There are statistically significant differences between the left and right side, as the incidence of aRAs were more frequent in the left than the right side (Chi-square test, P= 0.001)

The distribution of RAs that are supplying the right kidney classified as follow:

- a) Only one
- b) single renal artery is identified in 149 (79.3%) kidneys.
- c) Double renal arteries (one main RA and one aRA) were identified in 37 (20.1 %) kidneys.
- d) Triple renal arteries (one main RA and two aRA) were identified in 1 (0.5 %) kidney which considered one of the rare cases.

Regarding the left side, number of RAs that supplying the kidney distributed as follow:

- a) One single renal artery was identified in 125 (67.9 %) kidneys.
- b) Double renal arteries (one main RA and one aRA) were identified in 53 (28.8 %) kidneys.
- c) Triple renal arteries (one main RA and two aRA) were identified in 5 (2.7 %) kidneys.

Importantly, one rare case recorded in this study in which the left kidney supplied by quaternary renal arteries (one main RA and three aRA) were identified in 1 (0.5%) kidney. Therefore, a statistically significant

difference between the left and right side, as the incidence of multiple RAs were more frequent in the left than the right side (Chi-square test, $P= 0.001$). demonstrating the RA and aRAs. Regarding the prevalence of the renal arteries among genders. Although there were large differences in aRAs frequency between males and females (more frequent in males) in the current study but these differences were not statistically significant (Chi-square, $P= 0.663$)

Among the 80 cases with aRAs, 63 (78.7 %) cases presented unilaterally. The remaining cases 17 (21.2 %) were the aRAs presented bilaterally. There is a statistically significant difference between groups with respect to the symmetricity were unilateral incidence was higher than bilateral incidence (Chi-square test, $P< 0.001$).

Regarding the origin of renal arteries, the total arteries that are originating from the aorta and other sources supplying the right kidney are 223 renal arteries distributed as 184 of single main RAs and 39 aRAs. In the left side, the total number of the renal arteries were studied are 249 renal arteries originating from the aorta and other sources distributed as 184 of single main RAs and 65 aRAs. Regarding the rare cases, only one (2.5 %) aRA was originated from the superior mesenteric artery was identified in the right side. In the left side, only one (1.5 %) aRA was identified to originate from the left common iliac artery. Table 1 summarizing the origin of renal arteries from the aorta and other sources.

Table 1: Distribution of renal arteries origin.

	Single RA (n.)	(%)	aRAs (n.)	(%)
Right side origin				
Aorta	184	100	38	97.4
Superior mesenteric artery	0	0	1	2.5
Right common iliac artery	0	0	0	0
Total	184	100	39	100
Left side origin				
Aorta	184	100	62	95.3
Trunk of inferior mesenteric artery	0	0	2	3
Superior mesenteric artery	0	0	0	0
Left common iliac artery	0	0	1	1.5
Total	184	100	65	100

Figure 1: One of the rare cases demonstrating the aRA arising from superior mesenteric artery and merge with aorta and forming one artery supplying the lower pole of the right kidney.

The entrance of the main renal artery and aberrant renal arteries to the kidney:

The RAs that’s entering the kidney either to the kidney hilum or lower and upper poles calculated based on the total number of RAs supplying kidneys. In the right side, the number of arteries supplying the kidney is

223 RAs. All the single main RAs 184 (100%) was found to enter the kidney through the hilum. In the left kidney, the number of arteries supplying kidney is 249 RAs. All the 184 single main RAs enter the kidney through the hilum. Regarding the aRAs, Table 2 summarizing the distribution of aRAs position to the kidneys:

Table 2: distribution of aberrant renal arteries Entrance to the kidneys.

Position to the right kidney	n.	(%)
Lower pole	23	58.9
Upper pole	6	15.3
Hilum	9	23
Upper pole and hilum	1	2.5
Total	39	100
Position to the left kidney		
Lower pole	36	55.3
Upper pole	19	29.2
Hilum	9	13.8
Upper pole and hilum	1	1.5
Total	65	100

No stable course observed in aRA as out of 59 cases with aRAs in the left side, a group of variations in the course of aRAs was seen in this study:

1) The left aRA originating from the aorta (just above main RA) and crossing the main RA to supply lower pole of the kidney instead of the upper pole that’s demonstrated as nine cases (15.2 %) (Figure 2).

2) Regarding the right side, only one case (2.6 %) out of the 38 cases with aRA presented the crossing pattern; in which the aRA originating from the aorta and above the main RA then crossing it and enter the kidney hilum.

3) Two cases (3.3 %) demonstrating the aRA originating from the same trunk of the inferior mesenteric artery (Figure 3)

Figure 2: (a) and (b) showing the aRA (white arrow) arising just up to the main RA and crossing it to supply the lower pole of the left kidney.

Figure 3: The left aRA (white arrow) arising from aorta at the same trunk of inferior mesenteric artery (red arrow).

Regarding the eRA, in the right side, one tiny artery demonstrated in two (7.4 %) cases that were branching into two branches, first one reaching the pericardial area and the second one reaching the right diaphragm area supplying the right dome of the diaphragm. In the left side, a one (5.2 %) tiny eRA was reaching the left diaphragmatic curs.

Relationship between the aberrant renal artery and the diameter of the main renal artery.

Table 3 summarizing the diameter of main RA in case the presence of aRAs or not. However, on the right side, the diameter of the main RA in kidney presenting the aRA was significantly less than that of the kidney with single main RA (t-test, P= 0.006). Regarding the left side, the diameter of the main RA in kidney presenting the aRA was significantly less than that of the kidney with single main RA (t-test, P= 0.01).

Table 3: Summarizing the diameter of main RA in case presence of aRAs or not.

Symmetry	No.	Mean diameter of main RA (mm)	SD	P
Right side				
aRAs present	38	5.60	1.12571	0.006
aRAs not present	146	6.12	0.99664	
Total	184	11.73	2.12235	
Left side				
aRAs present	59	5.87	1.00817	0.01
aRAs not present	125	6.27	1.01004	
Total	184	12.1514	2.01821	

No.: number of cases, aRAs: aberrant renal arteries, (mm): millimeter, SD: standard deviation.

Discussion

Variations in the renal arteries are common, this explained by the development of the mesonephric arteries that's degenerates leaving only one mesonephric artery. Failure in degeneration of other mesonephric arteries results in an aberrant renal artery. This study is the first work in Iraq deals with aberrant renal arterial variation in details covering 184 kidneys donors' cases with medicolegal acceptance in Erbil city. This study showed the prevalence of aRAs of 26.3% compared with 20.2% in another angiographic study in Iraq [12] and within established ranges (20-30%) by most authors and textbooks [2&5]. The frequency of multiple renal arteries varies widely with ethnicity [13]. According to Gulas et al., the range of the frequency of multiple renal arteries depending on ethnicity is between 4% (Malaysians) and 61.5% (Indians) [14]. In the Polish population, the variability of multiple renal arteries seems to be between 11.2% and 38.3% [15]. This difference can be explained by the wide range of the prevalence of aRAs as showed by Satyapal et al (9-76%, average 28%) [13].

In this study, the entrance of aRAs to the kidneys was also studied. In the right side, 58.9% of the aRAs enters the lower pole of the kidneys, 23% of aRAs enters through the hilum, 15.3% enters the upper pole of the kidney. Regarding the left side, 55.3% of the aRAs directed toward the upper pole, and 29.2% passing to the upper pole, and 13.8% of the aRAs enters through the hilum. These findings matched with Alghizzi findings but the percentage lower than current study; Alghizzi reported the most of the aRAs was an inferior polar artery in 63.6% [12]. But present study findings disagreed with findings reported by Mustafa et al in which the results showed most of aRAs are pass through the hilum 53.62%, about 32.85% of the arteries enter the upper pole, and only 13.53% of the arteries enter the lower pole of the kidney [20]. Rarely, in the right side, only 2.5% aRA gives branch to upper pole and hilum of the kidney. Regarding the left side, only 1.5% of aRA gives branch to upper pole and hilum of the kidney.

There were variations in the course of aRA as interestingly, the left aRA originating from the aorta just above main RA and crossing it to supply lower pole of the kidney instead of the upper pole that's demonstrated as cases 15.2% . Regarding the right side, only 2.6% of the cases with aRA presented the crossing pattern; in which the aRA originating from the aorta and above the main

RA then crossing it and enter the kidney hilum. About 3.3% of the cases demonstrating the aRA originating from the same trunk of the inferior mesenteric artery (Figure 3).

Conclusion: This study concluded that:

1. The prevalence of aberrant renal arteries is 26.3% of Iraqi population.
2. Regarding the incidence side, it's more common in the left side (32.1%) than the right side (20.7%).
3. Presence of aberrant renal artery will affect the diameter of main renal artery; in which the diameter of the main RA in kidney presenting the aRA was significantly less than that of the kidney with single main RA.
4. No stable course observed in aRA in which the aRA originating from the aorta just above main RA and crossing the main RA to supply lower pole of the kidney instead of the upper pole.
5. Regarding the early branch renal artery, in the right side a one tiny eRA branching into two branches, one tiny artery reaching the pericardial area; and another artery that's reaching the right diaphragm area Source of Funding- Self

Evaluation of the Level of CXCL10 in Patients with Parainfluenza Virus Type III (HPIV3)

Noor Hameed Alkharsan¹, Siham Jasim Al-kaabi¹

¹Department of biology, Faculty of Education for women, University of Kufa, Najaf, Iraq;

Abstract

Acute respiratory illness could be caused by Human parainfluenza viruses (PIVs) in children, the old, and immunocompromised patients. The frequent and common cause of pneumonia and bronchiolitis is PIV3, whilst the upper respiratory tract illness and croup are frequently caused by PIV1 and PIV2. However, this study aimed to highlight a group of patients with type III influenza virus. 29 sample took from people suffering from upper and lower respiratory diseases as well as 27 control sample to assessing the level of a type of cellular motility in their catheter, cimclin cxcl10 by the use of ELISA. The study also showed that there were no significant differences between Male Injury Rate Now as well as an inverse relationship between the level of cimokin cxcl10 and age. Moreover, this study showed an increase in the level of cimcin cxcl10 in the case of HPIV infection compared with the control group.

Keywords: CXCL10; HPIV3; Respiratory infection

Introduction

Human parainfluenza viruses (HPIVs) are among the most common cause of acute airway illness in children, the elderly and immunocompromised patients ⁽¹⁾the elderly, and immunocompromised patients. PIV3 is a common cause of bronchiolitis and pneumonia, whereas PIV1 and 2 are frequent causes of upper respiratory tract illness and croup. To assess how PIV1, 2, and 3 differ with regard to replication and induction of type I interferons, interleukin-6, and relevant chemokines, we infected primary human airway epithelium (HAE. HPIV consists of four major serotypes, PIV4 is a common respiratory pathogen which is alike to PIV3 in clinical demonstration ⁽²⁾, whilst the upper respiratory tract illness and croup are frequently caused by PIV1 and PIV2 ⁽¹⁾the elderly, and immunocompromised patients. PIV3 is a common cause of bronchiolitis and pneumonia, whereas PIV1 and 2 are frequent causes of upper respiratory tract illness and croup. To assess how PIV1, 2, and 3 differ with regard to replication and induction of type I interferons, interleukin-6, and relevant chemokines, we infected primary human airway epithelium (HAE. Due

to optimal viral replication inside epithelial cells of the respiratory tract. HPIV3 is the common frequent in the worldwide amongst the four familiar serotypes that cause of hospitalization respiratory illness. Notwithstanding this high difficulty of illness, there is not any authorized vaccine or therapy to handle or even limiting this high difficulty of illness ⁽³⁾.

HPIV-3 is a virus which belongs to the Paramyxoviridae group, non-segmented, an enveloped as well as negative sense RNA virus ⁽⁴⁾non-segmented, negative sense RNA virus that belongs to the Paramyxoviridae family. HPIV-3 is a common cause of bronchiolitis and pneumoniae in children less than 1 year of age and one of the leading causes of acute lower respiratory tract infections in children under five years of age. In Israel, the epidemiology of HPIV-3 infections is not well characterized. In this study, epidemiology and molecular characterization of HPIV-3 was performed on patient samples collected between January 2012 and September 2015. Nasopharyngeal swabs (N= 15,946. HPIV-3 infecting lower airway epithelial cells induces bronchiolitis and pneumonia in children less than one year of age and one of age and it is considered as the leading cause of acute lower respiratory tract infections in children under five years of age ⁽⁴⁾non-segmented, negative sense RNA virus that belongs to the Paramyxoviridae family. HPIV-3 is a common cause

Corresponding author:

of bronchiolitis and pneumoniae in children less than 1 year of age and one of the leading causes of acute lower respiratory tract infections in children under five years of age. In Israel, the epidemiology of HPIV-3 infections is not well characterized. In this study, epidemiology and molecular characterization of HPIV-3 was performed on patient samples collected between January 2012 and September 2015. Nasopharyngeal swabs (N= 15,946. ⁽⁵⁾ reported that HPIV3 may lead to asthma exacerbations in children and adults. Respiratory viruses contributing to the pathophysiology of lower and upper respiratory disorders by invading the epithelium activate innate immune response and induce inflammatory cytokines release. However, the effects of HPIV3 infection have not been well-defined on nasal epithelial cells (HNECs).

Chemokines are small, structurally related proteins, one of them is the chemokine interferon- γ (IFN- γ) inducible protein CXCL10 and also called IP-10 is a 10 kDa protein, which is functionally categorized as a T helper 1- (Th1) chemokine. Furthermore, CXCL10 is a member of the CXC chemokine which is the ligand of CXCR3, and regulates immune responses through the activation and recruitment of leukocytes, such as, T cells, eosinophils, and monocytes to induce chemotaxis, apoptosis, cell growth and angiostasis (6).

Alterations in CXCL10 expression levels have been associated with inflammatory diseases such as immune dysfunction, infectious diseases, and tumor development. According to (7), the severity of various diseases can be predicted as well as recognized through CXCL10. Th1 orientated immune response is the special case of the host immune response that can be determined through CXCL10 level in blood. According to (8), CXCL10 is stimulated through Tumor necrosis factor- α and IFN- γ which is produced by Th1 lymphocytes in inflamed tissues recruited. The common abundant chemokines induced are The T cell chemoattractants CXCL11 and CXCL10. Differences in replication and cytokine secretion might explain some of the differences in PIV epidemiology and serotype-specific pathogenesis(1)the elderly, and immunocompromised patients. PIV3 is a common cause of bronchiolitis and pneumonia, whereas PIV1 and 2 are frequent causes of upper respiratory tract illness and croup. To assess how PIV1, 2, and 3 differ with regard to replication and induction of type I interferons, interleukin-6, and relevant chemokines, we infected primary human airway epithelium (HAE. In order to adequately recognize determinants of variability of immune responses to respiratory virus infections of

airway epithelial cells in patients, this study focused mainly on understanding of the role of CXCL10 in HPIV3 infected patients.

Materials and Method

Blood samples

Blood samples were collected from people suffering from upper and lower respiratory diseases. The samples were collected from Al-Sadr Teaching Hospital and Al-Hakim General Hospital in Najaf Governorate. 5 mL of venous blood was withdrawn using a sterile syringe placed in a test tube containing no anticoagulant. The blood was then left at room temperature for half an hour; the serum was then removed from the rest of the blood components using a sterile microbial. It was distributed in five Pendrove tubes and 200 microliters per tube for the purpose of avoiding melting. , And was frozen (20-m) until the test (9).

Method

The antibodies against Parainfluenza (IgM) was determined in patients' and control urine, using ELISA technique , the test was performed according to the method reported and supplied with the VIRCELL test kit.

The number of tests used by Ray Biotech was used to measure the quantitative level of the public health laboratory in Najaf Governorate, as follows: The double-check factor and the human control factor (CXCL10) are studied in serum samples and by the associated immunosorbent system (Sandwich ELISA)

Statistical Analysis

The data were analyzed statistically using computerized SPSS v.24. Non-parametric tests has been used for variables that were n't followed the normal distribution such as Kruskal-Wallis Test (Multiple Comparisons) and Mann-Whitney Test, and Chi-square Test. ANOVA has been employed for variables that followed the normal distribution. Also, Microsoft Excel 2016 has been adopted to build histograms and figures of the correlation test. Data were expressed as (mean \pm SE), statistically significant at p-value 0.05.

Result and Discussion

Many studies have focused on HPIV-3 infection in children because of high positive rate and morbidity of

HPIV infection in kids⁽¹⁰⁾, therefore less is known about HPIV2 and HPIV-3 infection in adults.

In this study, 88 blood samples were collected from hospitalized HPIV-3 patient suffered from upper and lower respiratory airway after clinical diagnosis by the specialist doctor. The samples were collected from Al-Sadr Teaching Hospital and Al-Hakim General Hospital in Najaf Governorate, compared to 27 healthy people who did not suffer from respiratory or other chronic diseases, they were considered a control group.

Figure (1) Spread of Parainfluenza virus type III HPIV3 in patient samples

The study demonstrated that the majority of HPIV3 patients had chronic infection negative IgM 59 (67%) while, 29 (33%) of HPIV3 patients had acute infection (positive IgM) as depicted in figure(1). This result somewhat compatible with previous studies have reported that, the majority of antibody levels of specific immunoglobulin G (IgG)-class antibodies in serum samples collected during the convalescent phase of the disease over the detection of specific IgM present during the acute phase of infection.⁽¹¹⁾

Figure (2): Percentage of clinical signs of patients infected with parainfluenza hpiV3

In figure (2) HPIV3 infections cause significant morbidity and burden of hospitalization. Clinical diagnosis revealed, 27.3% had bronchitis, bronchiolitis 25%, tonsillitis 22.7%, laryngitis 6.8%, and 2.4% had pharyngitis, these finding agree with the study noted that laryngeal trachea bronchitis (LTB) was most often

caused by HPIV 1 and HPIV 2 with only a single case caused by PIV 3, cases of bronchiolitis occurred during infection were 26%, while 70% cases of pneumonia were caused by PIV 3⁽¹²⁾.

PIV in children accounted for 6.8% of all hospitalizations for fever and/or acute respiratory illnesses. HPIV3 is the most frequent cause of hospitalization, followed by HPIV1 and HPIV2⁽¹³⁾. Some study reported that, the most common presenting symptom was cough 78% but other signs and symptoms of acute respiratory tract infection were common. 62% of patients had a documented fever upon presentation, and 40% of patients presented with gastrointestinal complaints of vomiting, diarrhea⁽¹²⁾, and our findings agree with the previous clinical reports that, almost all patients had some respiratory symptoms, the majority had cough 63.6%, and a large proportion also had documented breathlessness was 59.1%, fever 54.5%, vomiting 29.5% and rhinorrhea was 25%, Both of clinical diagnosis and symptoms have significant differences at $P < 0.05$ figure (3).

Figure (3): Percentage of clinical symptoms of patients with HPV3

HPIVs are common community acquired respiratory pathogens responsible for respiratory infections throughout the world without any gender, ethnic, age, or geographic boundaries⁽¹⁰⁾; however, morbidity and mortality rates are higher in patients living in poor countries such as rural areas without access to supportive care as compared to developed countries⁽¹⁴⁾.

This study shown that HPIVs were more commonly isolated from females patients than male in patient with acute infection (positive IgM), they were 10 males and 19 females, their ages ranged from 20 to more than 50 years with (Mean \pm SD) (39.97 \pm 2.83), a control group with mean age 40.85 \pm 2.79, the Patients from cities were 14 and rural areas were 15 Patients. Therefore, no significant differences were found in the result of age, sex and

housing between patient and control group. While other studies founded that, the median age (77.5 years; range, 19.0 - 84.0 years) of the 24 HPIV-3-infected patients was higher than the median age (63.0 years; range, 18.0-99.0 years) of 961 patients who tested HPIV-3-negative and also agree with us no significant differences found (P 5. 04) ⁽¹⁵⁾we tested acute- and convalescent-phase serum specimens from hospitalized adults participating in a population-based prospective study of lower respiratory tract infection during 1991–1992. We tested all available specimens from the epidemic seasons for each virus and ~300 randomly selected specimens from the corresponding off-seasons for antibodies to HPIV-1, HPIV-2, or HPIV-3. During the respective epidemic season, HPIV-1 infection was detected in 18 (2.5\%\%, which was older than our findings it can be because the result of the past decades.

PIV infection causes a spectrum of diseases associated with the expression and release of proinflammatory mediators, PIV-infected patients had higher nasal wash concentrations of chemokines such as CXCL8, CXCL9 and CXCL10 as compared to uninfected control patients ⁽¹²⁾. A specific diagnosis of a lower and upper respiratory viral infection is often difficult despite frequent clinical suspicion, may be improved the diagnostic tools by use of sensitive detection methods and biomarkers. The previous study demonstrated, that the T cell chemo attractants CXCL10 one of the most abundant chemokines induced in HPIV3 ⁽¹⁾the elderly, and immunocompromised patients. PIV3 is a common cause of bronchiolitis and pneumonia, whereas PIV1 and 2 are frequent causes of upper respiratory tract illness and croup. To assess how PIV1, 2, and 3 differ with regard to replication and induction of type I interferons, interleukin-6, and relevant chemokines, we infected primary human airway epithelium (HAE. Human airway epithelial cells may generate CXCL10 in response to

virus infection with high concentrations. In particular, have been correlated with more severe HPIV disease ⁽¹⁶⁾.

This study findings support previous research, where this study found a significant difference in CXCL10 concentrations in patients when compared to control cases (P< 0.001), whereas CXCL10 concentrations levels were higher in patients than control group, the mean was 2023.98±273.13 and 776.62±86.79, respectively. Moreover other study suggested that, respiratory viruses can be found in patients with serious acute airway illness CXCL10 may be a useful biomarker for viral ARI (as opposed to non-viral) by use of PCR assays more frequently than previously appreciated ⁽¹⁷⁾ clinical predictors and inflammatory mediator profile of respiratory viral infection in serious acute respiratory illness were investigated. Sequential bronchoalveolar lavage (BAL.

A study conducted by ⁽¹⁸⁾ on 164 healthy subjects with age ranges from 10 to 79 year-old. They reported that serum levels of CXCL10 and sCCL2 were significantly increased in older individuals (r = 0.32, P < 0.001). This finding is in contrary with our finding, where, a significant negative correlation between was found between the serum level of CXCL10 and older HPIV3 patients (r=-0.428, P=0.020). This might be due to the small number of patients examined in the current study as compared to that of their study.

To compare the result associated with this study, we classified HPIV3 patient with acute infection (positive IgM group) into three different age groups. Group I consisted of 13 patients with age range from 20-34, group II consisted of 6 patients with age range 35-49 and group III 10 patients with age more than 50 year and were each group appears normally distributed using descriptive statistics.

Table (1): The effect of age in the concentration of CXCL10 among the group of HPIV3 (HPIV3 IgM) compared to control group

Age group	Control (SD ± mean)	CXCL10 (SD ± mean)	Number of patients
20-34	966.62 ± 145.07	2304.42 ± 435.4	13
35-49	966.62 ± 145.07	2148.63 ± 820.91	6
≥ 50	696.52 ± 110.22	1584.62 ± 293.29	10

In Table (1), figure (4) A significant relationship between CXCL10 among different age group of HPIV3 patients compared to control group was founded in this study with $P < 0.05$, the concentration of CXCL10 for the age group I was 2304.42 ± 435 compared to control group (145.07 ± 966.62) pg / ml, whereas the concentration of CXCL10 for the age group II was 2148.63 ± 820.91 compared to the control group (145.07 ± 966.62) pg/ml. In the group III CXCL10 concentration 1584.62 ± 293.29 was compared with control group (110.22 ± 696.52) pg / m. This is agreeing with the study which mentioned that, decrease in pro-inflammatory cytokine expression by aging in bronchoalveolar lavage patients ⁽¹⁹⁾the natural variation of cytokine expression in healthy horses has yet to be described. The objectives of this study were to: (1. This finding is in contrary with ⁽²⁰⁾ study, increase of pro-inflammatory cytokines production by age-associated may be a co-factor for the pathogenesis of airway diseases, where pro-inflammatory cytokines in humans such as CXCL10 are increase with age, the phenomenon known as ‘inflamm-aging’.

Figure (4):An inverse (negative) relationship between CXCL10 concentration and age in patients with HPV3 ($r = -0.428$ *, $p = 0.020$)

Table (2) the effect of sex in the concentration of CXCL10 among the group of HPIV patients (HPIV3 IgM) compared to control group

Group of study	Gender	SD ± mean	Total
Patient	Male	*385.72± 2001.66	29
	Female	*327.73 ± 2066.38	
Control	Male	134.50 ± 771.04	27
	Female	116.38 ± 781.81	

On the other hand, according to gender in table (2), the observed association of HPIV3 with over expression of CXCL10 were more pronounced in female than males in both patient and control group, the concentration of CXCL10 for males patients was (2001.66 ± 385.72 *) pg / ml compared with the control group (771.04 ± 134.50) pg / ml, while the CXCL10 concentration for females patients was (2066.38 ± 327.73 *) pg / ml compared to the control group (781.81 ± 116.38) pg / ml. This finding is in agreement with the result of (18) reported that CXCL10 was slightly higher in healthy females than that of males. This may be due to estrogen enhanced CXCL10 expression (21). But this study finding is contrary what mentioned before, over expression of CXCL10 were more pronounced in males than in female patients with Cerebral malaria (22)CXCL10, is a strong predictor of both human and experimental cerebral malaria. Increased plasma and cerebrospinal fluid levels of CXCL10 were tightly associated with fatal CM in Indian and Ghanaian patients. In the present study, we hypothesized that in a subset of malaria patients, CM susceptibility is associated with variation in CXCL10 expression. We determined whether polymorphisms in the CXCL10 gene promoter region played a role in the clinical status of malaria patients and addressed the genetic basis of CXCL10 expression during malaria infection. Following extensive bioinformatics analyses, two reported single nucleotide polymorphisms in the CXCL10 promoter ($-135G>A$ [rs56061981] and $-1447A>G$ [rs4508917]. Further study involving larger sample size is recommended for evaluating usefulness of these markers in HPIV3 patients.

Abstract

Background: The failure rate of arterio-venous fistula shunt for hemodialysis access in patients with chronic kidney disease is high. Vascular characteristic is one of the important indicators in successful operation.

Objective: To determine the association between pre-surgery vascular ultrasonography characteristics and the successful arterio-venous fistula shunt surgery as hemodialysis access in patients with chronic kidney disease stage V.

Methods: This study used descriptive analytic studies to determine the relationship between pre-operative vascular ultrasonography characteristics, such as arteries (diameter, velocity, thickness of intima-media tunica) and vein (diameter, velocity, depth) with successful arterio-venous fistula shunt surgery that evaluated in four week post-surgery in patients with chronic kidney disease stage V.

Results: Eighteen samples that consisted of 27.8% female and 72.2% male were enrolled in this study. The most surgery location was vascular radio-cephalic of 13 samples (72.2%). Statistical analysis used was Mann-Whitney U Test. There was no significant correlation between arterial diameter ($p=0.127$), venous diameter of AVFs ($p=1.000$), arterial velocity ($p=0.721$), velocity vein ($p=0.721$), intima media tunica thickness ($p=0.721$), and venous depth ($p=0.192$) with successful arterio-venous fistula shunt surgery.

Conclusion: There was no significant correlation between diameter, thickness of intima media tunica, and arterial velocity as well as diameter, velocity and venous depth with successful arterio-venous fistula shunt surgery.

Keywords: *Vascular, Ultrasonography Examination, Arterio-venous Fistula*

Introduction

In patients with catheterization or patients requiring venous access, doppler ultrasonography of upper limb

venous was required for identifying suitable vascular to access. This vascular was screened for the possibility of central stenosis or occlusion. It was recommended to use pre-surgery ultrasonography in patients who had experienced previous central venous access associated with deep venous thrombosis in order to assess central or occlusion stenosis¹. SG of vascular mapping prior to placement of hemodialysis access was a prescribed procedure. Pre-surgery sonographic mapping prior to placement of hemodialysis access may change surgical management, with an increasing number of AVF and the

possibility of an increase in the most functional vascular selection².

Chronic Kidney Disease (CKD) is the final stage of renal failure with the Glomerular Filtration Rate (GFR) of <15 ml/minute³. Causes of CKD are diabetes mellitus, hypertension, renal ischemia, toxic substances, obstruction, autoimmune disease and renal infiltration⁴. Data from The United States Renal Data System (USRDS 2013) showed the prevalence rate of people with chronic kidney disease in the United States (2011) of 1,901 every a million population. Treatment of End-Stage Organ Failure in Canada (2000-2009) reported that nearly 38,000 Canadians lived with chronic renal failure and has increased almost three times from 1990. 59% of those number (22,300) have undergone hemodialysis and 3000 patients have been waiting kidney transplant⁵. Meanwhile, Indonesia reached 200-250 cases every a million populations every year.

Hemodialysis requires a well-functioning vascular access. The best type of vascular access is the Arterio-Vena Fistula (AVF). Making AVF is associated with failure rates and complications. The most common causes of AVF dysfunction are non-maturation, thrombosis, and stenosis, thus most cases of previous stenosis lead to disruption of blood flow. Function and morphological of USG was used for AVF dialysis that affects the risk of vascular access dysfunction⁶.

Vascular access is ideal if it can be used for long periods of time as access to blood circulation with minimal complications. Arterio-venous fistula (AVF shunt) is the most ideal access of all available hemodialysis access. If AVF shunt is successful then it can be used for long periods with low thrombosis and infection rates, without much interventions and low costs⁷. AVF-shunt cubiti operation is an AVF operation technique. AVF shunt operation is the first choice in AVF technique whereas; AVF cubiti is the second choice. However, the failure rate of both techniques remains high⁸. There remains a high failure rate of fistula arterio-venous shunt installation in patients with chronic kidney disease. Complications of vascular access are the common cause of failure and hospitalization in dialysis patients. Limited data to comprehend the complications of arterio-venous fistula especially stenosis and thrombosis also inhibit the success of arterio-venous fistula techniques.

Based on the research described above, it is necessary to examine the association between the characteristics of

arterial ultrasonography (USG) and pre-surgery vein with the successful AVF shunt surgery, thus the characteristic factor of arteries and veins that affect the success of shunt AVF operation could be recognized. Therefore, the authors aimed to determine the association between pre-surgery vascular ultrasonography characteristics and the successful arterio-venous fistula shunt surgery as hemodialysis access in patients with chronic kidney disease stage V.

Method

This study was a retro-prospective longitudinal with the observational design. We used a consecutive sampling technique to the patients of chronic kidney disease stage V. The inclusion criteria were patients aged >18 years, undergoing routine hemodialysis or will be planned of routine hemodialysis, had been performed operation of AVF shunt in Dr. Soetomo General Hospital Surabaya from January to March 2015.

Patients with chronic kidney disease stage V, which will be operated with AVF shunt as a hemodialysis vascular access, were performed USG examination using high-resolution USG Hitachi equipped with linear probes (7-10 MHz) in Radio Diagnostic Unit of Dr. Soetomo General Hospital Surabaya. The scan was performed in recumbent position with the arm down of 45 degrees from the body.

The USG results were recorded and then analyzed statistically. Descriptive analysis was conducted to obtain the characteristic of the sample. Normality test using Kolmogorov-Smirnov test was performed prior to analyze the correlation between pre-surgery vascular ultrasonography characteristics and the successful arterio-venous fistula shunt surgery as hemodialysis access. Mann-Whitney U Test was used with confidence interval of 95% and p value <0.05. The analysis was conducted with SPSS software. The study protocol was approved by Dr. Soetomo Teaching Hospital.

Results

Characteristics of Subjects

This study obtained 16 CKD patients who will be performed AVFs surgery. Patients consisted of 12 male and 4 female with age ranged from 33 to 62 years. All patients had a vascular duplex USG examination at the location that will be performed, however two patients performed two surgeries at different sites due to the

failure on the first surgery thus we obtained 18 samples. The youngest age of the patient was 33 years old and the oldest was 62 years.

that will be performed AVFs surgery was 51-60 years of 9 patients (50%). The age group of <40 years was 2 patients (11.1%), 41-50 years old of 6 patients (33.3%), and >60 years of 5 patients (5.6%) (Table 1).

Distribution of Subjects by Age

The most age group in eighteen samples of study

Table 1. Distribution of Samples by Age

Age	Frequency	Percentage (%)
< 40 years	2	11.1
41-50 years	6	33.3
51-60 years	9	50.0
> 60 years	1	5.6
Total	18	100.0

Distribution of Subjects by Sex

We found 13 male (72.2%) and 5 female (27.8%). CGK patients who had pre-surgery vascular USG of AVFs were more prevalent in males than females with a ratio of 3:1

Distribution of Subjects by AVFs Location

Subjects who had performed AVFs surgery were 5 patients (27.8%) in the inferior fossa cubiti brachio-cephalic blood vessels and 13 (72.2%) subjects who had performed surgery on arterial radio-cephalic arteries.

Characteristics of Vascular Samples

Table 2. Characteristics of Vascular Samples

		Mean	Median	SD	Minimum	Maximum
Diameter (mm)	a.Brachialis	3.2	3.2	0.2	2.9	3.5
	a.Radialis	2.1	2.2	0.5	1.2	2.8
	v.Cephalica	1.6	1.5	0.8	0.6	3.5
Tunica intima Media (mm)	a.Brachialis	0.4	0.4	0.07	0.3	0.5
	a.Radialis	0.4	0.3	0.1	0.2	0.6
Velocity (cm/s)	a.Brachialis	51.8	50.5	16.3	28.4	74.0
	a.Radialis	52.1	47.3	15.4	27.8	73.8
	v.Cephalica	7.1	7.2	2.7	3.2	12.3
Depth (mm)	v.Cephalica	2.8	2.6	0.9	1.8	4.4

Table 2 showed the vascular characteristics of the sample consisted of the brachial artery, radial artery, and cephalica vein as the vascular access of the AVFs surgery. We found five samples of brachial artery, 13 samples of radial artery, and 18 samples of venous cephalica.

Distribution of Subjects Based on Successful AVFs Surgery

Eight-teen samples have been performed AVFs operation which resulted in 14 (77.8%) successful operations and 4 (22.2%) failed operations.

Results Analysis

The Correlation of Artery Diameter with AVFs Operating Results

Successful AVFs surgery was 14 (77.2%) samples with a minimum diameter of 1.5 mm, a maximum of 3.5 mm, a median of 2.4 mm and a mean diameter of 2.5 mm and a standard deviation of 0.6. Meanwhile, failure surgery was 4 (22.8%) samples with a minimum diameter of 1.2 mm, maximum of 2.6 mm, a median of 1.8 mm and mean diameter of 1.8 mm and standard deviation of 0.7. The statistical test showed no association between arterial diameter with AVFs surgery results ($p=0.127$).

The Correlation of Vena Diameter with AVFs Operating Results

From 18 samples of the study, 14 (77.2%) of cephalica vein samples from successful AVFs surgery had a minimum diameter of 0.6 mm, a maximum of 3.5 mm, a median of 1.6 mm and a mean diameter of 1.6 mm and a standard deviation of 0.7. Whereas, 4 (22.8%) of cephalica vein samples from failed surgery had a minimum diameter of 1 mm, a maximum of 3.4 mm, a median of 1.4 mm, a mean of 1.8 mm diameter and a standard deviation of 1.1. The statistical test showed no association between vein diameter and result of AVFs surgery ($p=1.000$).

The Correlation of Artery Velocity with AVFs Operating Results

From 14 samples of brachial artery and radial artery from successful AVF operation had a minimum velocity of 27.8 cm/s, a maximum of 74 cm/s, a median of 50 cm/s and a mean of 50.9. Meanwhile, 4 samples from failed operation had a minimum velocity of 40 cm/s, maximum of 71.3 cm/s, median of 56.7 mm, mean of 56.2 cm/s and standard deviation of 15.5. Statistical tests showed that there was no association between arterial velocity and successful AVFs surgery ($p=0.721$).

The Correlation of Vena Cephalica Velocity with AVFs Operating Results

From 14 venous cephalica samples had a minimum velocity of 3.6 cm/s, a maximum of 12.3 cm/s, median of 7.2 cm/s and mean of 7.3 cm/s and standard deviation of 2.6. While the 4 sample venous cephalica from the failed operation had a minimum velocity of 3.2 cm/s, maximum of 10 cm/s, median of 6.1 cm/s, mean of 6.4 cm/s and standard deviation of 3.3. The statistical test showed no association between velocity of venous and successful operation of AVFs ($p=0.721$).

The Correlation of Thickness of Tunica Intima Media Artery with AVFs Operating Results

The intima media tunica thickness of 14 (77.2%) successful surgeries had a minimum diameter of 0.2 mm, a maximum of 0.6 mm, a median of 0.4 mm, a mean of 0.4 mm and a standard deviation of 0.15. Whereas, 4 (22.8%) samples from failed operation had a minimum intima media tunica thickness of 0.3 mm, maximum of 0.4 mm, median of 0.4 mm, mean of 0.4 mm and standard deviation of 0.06. The statistical test showed no correlation between intima media tunica thickness with successful AVFs surgery ($p=0.721$).

The Correlation of Depth of Vein with AVFs Operating Results

We found 14 (77.2%) samples from successful AVFs operations with a minimum depth of 1.8 mm, a maximum of 4.1 mm, a median of 2.5 mm and a mean of 2.6 mm. While 4 (22.8%) failed samples had a minimum depth of 2.2 mm, maximum 4.4 mm, median 3.4 mm and mean of 3.4 mm. The statistical test showed no association between cephalica vein depth with successful AVFs surgery ($p=0.192$).

Discussion

Doppler USG of vascular provided qualitative and quantitative data on arterial and venous systems prior to the establishment of AVFs. Doppler USG techniques could identify which veins are often missed on clinical examination. This approach was particularly useful in patients with DM and the elderly due to arterial narrowing and a relatively common classification in patients with CKD. Therefore, arterial evaluation should be performed to determine patency, morphology of capillary walls, diameter and anatomy, while venous evaluation was performed to determine patency, diameter, and depth⁹.

The study obtained 18 samples consisted of 5 females (27.8%) and 13 males (72.2%). The most common age

group was 51-60 years by 8 people (50%) followed by age group of 41-50 years by 5 people (31.25%). This was similar the epidemiological data of CKD patients who underwent hemodialysis that it happened more in male than female and often occurred at the age of 40-60 years old¹⁰.

The diameter of the artery in this study was smaller than the mean diameter of the brachial artery in other studies by 4.31 ± 0.77 mm and the mean of radial artery by 2.325 ± 0.4 mm^{11, 12}. The velocity of the brachial and radial arteries in this study was lower than the normal value of Brachial artery by 50-100 cm/s and Radial artery by 40-90 cm/s¹³.

There was no significant correlation between arterial diameter and AVFs operation results ($p=0.127$); the mean diameter of successful surgery was 2.5 mm and the failed surgery had a mean of 1.8 mm. The successful AVFs surgery were linked to a minimum diameter of artery by 2 mm⁹.

The statistical test showed no correlation between the thickness of tunica intima-media with the successful operation of AVFs ($p=0.721$). Moreover, there was no association between arterial velocity and AVFs surgery results ($p=0.721$); a mean velocity of successful surgery was 50.9 cm/s and a mean velocity of failed surgery was 56.2 cm/s.

Statistics tests showed no association between vein diameter and AVFs operation results ($p=1,000$). The mean of venous diameter on successful AVFs was 1.6 mm and failed AVFs had a mean diameter of 1.8 mm. The results were different to a study by Silva who reported successful surgery of AVFs had a minimum diameter of 2.5 mm and she recommended a diameter of at least 3 mm for AVFs surgery⁹.

The larger diameter of the cephalic vein was associated with lower resistance of blood flow and increased blood flow rate in the fistulas. The larger diameter of the cephalic vein was also associated with low risk of thrombotic, post-inflammatory lesions, and morphological vein wall abnormalities. This results confirmed the importance of pre-surgery vascular assessment prior to the establishment of AVFs⁶. Previous studies recommended to use an artery diameter of at least 2.5 mm and a vein diameter of at least 2 mm to establish the AVFs. However, there was no agreement on the threshold value of minimal diameter of the artery or vein that should not be used to form anastomosis. Therefore,

there was also a medical center which required an AVFs procedure with a diameter of less than 1.5 mm⁶.

This study also showed that there was no association between venosity of venous and successful AVFs surgery ($p=0.721$); the mean velocity of the successful operation was 7.3 m/s and the mean velocity of failed operation was 6.4 cm/s. Moreover, there was no association between cephalica vein depth with successful AVFs surgery ($p=0.192$). The mean venous depth of successful operation was 2.6 mm and the failed operation had a mean vein depth of 3.3 mm. This study showed that successful AVFs surgery had higher velocity rates and a shallower cephalic vein depth.

Conclusion

There was no significant correlation between diameter, thickness of intima media tunica, and arterial velocity as well as diameter, velocity and venous depth with successful arterio-venous fistula shunt surgery.

Ethical Clearance: The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, nonmaleficence, and justice.

Conflict of Interest: There is no report of conflict of interest involved with this study so far.

Source of Funding: This study is funded by authors' fund only without external funds or donation.

Prevalence of Childhood Disability in Basrah City Using the Ten Questions Too

Hajer Salim AlMosawi¹, Sajjad S. Issa², Mohamad A. Akber³

¹Pediatric Nursing, ²Family Medicine, ³Orthopedic Surgeon, Department of Fundamental of Nursing, College of Nursing, University of Basra, Basra, Iraq

Abstract

Background: The neglect of disabled children in the developing countries and less information about its types and prevalence in addition to the low level of health services they had.

Aim: To identify the prevalence of handicapping disabilities among children up to 9 years of age and their epidemiological pattern in the Basrah city center.

Methods: In a population-base, cross-sectional household survey was carried out in Basrah city. A total sample (1734) children, males were 56% and females were 44 % of the sample using the ten questions survey tool.

Results: The survey team detected 73 disability cases 48 were males and 25 were females. The detected prevalence of disability in our sample was 37.7%. Disabled children, on average, were in the fourth or fifth birth order among their brothers and sisters and 47 % of them were counted as the second or third disability in the same family. The number of disabling conditions in the same child varied widely: 31.5% of cases had a single disability, 24.6% had two conditions and 43.8% had three or more conditions. The questionnaire children up to 9 years of age in these families formed 56.2% of the population.

Conclusion: The survey managed successfully to document a comparable estimate of the prevalence rate for childhood disabilities in the community and provided a general picture of their types and suspected causes. It also reported a low service delivery for these disabilities and identified some risk factors related to their occurrence. To apply this survey method in center Basra city is justified in an extended field study with certain modifications to suit the local culture. This study also should be complemented with a second stage referral for follow up examination of detected cases of and evaluation of the disability and its required services.

evident, such as cognitive and hearing disabilities¹². A fourth approach consists of household surveys³.

However, information on the validity of single-phase survey data on disabilities in children is lacking, especially in developing countries. In addition, instruments that have been used to survey childhood disabilities in developed countries are unlikely to be cross-culturally valid in developing countries. The above considerations led to the development of a two-phase methodology for surveying childhood disabilities in populations where professional resources are extremely limited. This paper describes the methodology, presents data on its reliability and validity across culture, discusses its uses and limitations, and identifies areas for future research⁴. The need for information on the frequency of childhood disabilities in populations, as well as the status and characteristics of children with disabilities, has been emphasized repeatedly¹⁻⁷. For example, information on the number and status of children with mental retardation, learning, vision, hearing and seizure disabilities⁵. Behavioral disorders is needed to monitor on a population level the impacts of: improvements in survival; exposures to nutritional deficiencies, environmental toxins, serious diseases and trauma; and interventions designed to improved child health and development. In addition, population-based, epidemiologic studies of childhood⁶. Disabilities are needed for identifying risk factors and causes, and for needs assessments to facilitate planning of services for children and families with special needs⁷.

In countries with reasonably well-developed services for children with disabilities, administrative data and registries provide a useful source of population-based information on childhood disabilities⁸⁻¹⁰. However, in most low income or developing countries, where services for children with disabilities are not universally⁸. Available, administrative data, if available at all, provide an incomplete account. Census data provide an alternative source of population data on disability, but it is likely that these data under-identify disabilities in children and especially in girls and children of low socioeconomic status¹¹ a third approach is the so-called 'key informant'⁹. Approach, which relies on interviews with teachers, health care providers and other key persons in a community to identify children in the with disabilities. This approach, however, has been shown to miss disabilities that are least publicly evident¹⁰.

Such as cognitive and hearing disabilities and to include children from outside the population of interest¹¹. A fourth approach consists of household surveys. However information on the validity of single-phase survey data on disabilities in children is lacking, especially in developing countries. In addition, instruments that have been used to survey childhood disabilities in developed countries are unlikely to be cross-culturally valid in developing countries¹². The above considerations led to the development of a two-phase methodology for surveying childhood disabilities in populations where professional resources are future research extremely limited. This paper describes the methodology, presents data on its reliability and validity across culture, discusses its uses and limitations, and identifies areas for Handicapping disabilities in both developing and developed countries are important public health issues¹³.

Basic data on their frequencies, underlying risk factors and associations are necessary in order to plan health programs and to provide social services for them. Screening in community surveys is a good strategy for providing a quick insight for this problem among children¹⁴. Many community surveys have been conducted for handicapped children in various parts of the world." the ten-questions survey tool was proposed for this purpose and has been validated for its sensitivity and specie city in many developing countries. This paper is reporting a led survey in Jeddah, Saudi Arabia¹⁵. In which a population-based study has applied the ten-questions tool to estimate the prevalence of handicapping disabilities among children up to 9 years of age and describe the epidemiological pattern of disabilities in the eastern part of the city. The study was part of the training led survey for male medical students in the Medical College. All children have a right to care by a parent or trusted adult¹⁶. In countries with reasonably well-developed services for children with disabilities, administrative data and registries provide a useful source of population-based information on childhood disabilities.

Material and Method

Study setting and population

A Population based cross-sectional study carried out in Basra city from October 2016 to February 2017. The estimated population of Basra city center is 38,989 and about 28.7% of that population being female in

child bearing age. Interviews at the selected houses were conducted primarily by gathering the basic socio-demographic information of the family from the head of the family, usually the father. Variables included in this part were family income, number of family members, age of the child, ages of parents, occupation of parents, educational level of parents, history of disabilities in either parents families and consanguinity between parents. The ten questions tool with their probes was explained to the head of the household to detect any disabled member of the family in the age 9 or below. Houses with no children at the required age were skipped and replaced by the next one fulfilling the research criteria. The detailed questionnaire was filled for any child with a positive answer on one or more of the disability questions.

The study sample and data collection

Total 1734 samples were collected to study the prevalence rate of childhood disabilities in Basra center from November 2016 to March 2017. The percentage of under nine years children from the total population is about 11.8% (WHO).

Statistical analysis

The data were fed to the (SPSS) program (version 16) for interpretation of result, through the application of the descriptive data analysis frequency and percentage.

Results

In the present study, we have screened 4601 population and about 1734 samples were collected for further studies. So the prevalence can be calculated as follows

$$\text{Prevalence} = 1734/4601 * 100 = 37.7 \%$$

In the collected samples (1734), about 984 (56%) were males and 750 (43.2%) were females. It shows the high percentage male (56%) and the lower percentage female (43.2%) from the total sample.

Table 1. Characteristics of number of disable children in the family

Number of children	No.	%
1	5	6.8
2	30	41
3	37	52
Total	73	4.2

The high percentage (52%) of the studied families had three disabled child while the lowest percentage (6.8%) of families had only one disabled child's.

Table 2. Characteristics of order of birth of disable child among their sibling in the family

Order	No.	%
1	2	2.7
2	3	4.1
3	3	4.1
4	40	54.7
5	25	34.2
Total	73	4.2

This table show that the high percentage (54.7%) of disabled children had the fourth order of birth among their siblings in the family while the lower percentage (2.7%) have had the first order.

Table 3: Age frequencies of all children and the disabled group

Age	Disabled group		All children	
	No	%	No	%
1 year >	1	1.3	85	4.9
1 – 2	8	10.9	121	6.9
2- 6	23	31.6	619	35.6
6-	41	56.2	909	52.4
Total	73	42	1734	43.3

This table show disabled group in age (6 -9) has 56.2% the high percentage this age group high percentage in total sample.

Table 4. Frequency of various types of disabling conditions in Basra city

Condition	Previously diagnosed	Newly identified
Speech	23	3
Motor	12	2
Mental	9	3
Fits	7	1
Learning difficulty	6	2
Hearing	7	1
Vision	4	1
Emotional problem	3	1
Chronic or hereditary	2	1

Conditions have not been totaled due to multiple disabilities in some cases.

Table 5. Causes of disabilities as perceived by parents

Suspected cause of disability	No	%
Hereditary causes	37	50.6
Non hereditary illnesses	10	13.6
Accidental/traumatic causes	4	5.4
Other causes	2	2.7
Unknown cause	20	27.3

This table show high percentage 50.6 the parents believes hereditary causes and the lower percentage 2.7 has other causes.

Discussion

Disabled children in developing countries are estimated to form 85% of the world’s disabled children). Accurate determination of the prevalence is hindered by a group of inherent problems in these countries including under reporting, late identification, poor registration and lack of infrastructure for their monitoring and service provision.To overcome these shortcomings, a variety of methods were tried in order to identify disabilities at the community level.These include the addition of questions to the national census

and the interviewing of key informants in the community such as community leaders and teachers. The previous methods were found to produce serious faults of under-enumeration of handicapping conditions and under representation of children and women. “Researchers in developing countries have proposed the use of the ten question tool in a house survey to overcome these drawbacks. The questionnaire Children up to 9years of age in these families formed56.2% of the population (1734)with male forming 56% of them.Household. Using the ten questions survey tool, the survey team detected 73`disability cases in the age group males.. Disabled children, on average, were in the fourth or fifth birth order among their brothers and sisters and 47 % of them were counted as the second or third disability inthe same family. The number of disabling conditions in the same child varied widely: 31.5% of cases had a single disability, 24.6% had two conditions and 43.8% had three or more conditions. These conditions were categorized according to the answers on the ten questions (table 6). Disabled children. The survey tool managed to document, successfully, a prevalence rate of childhood disabilities in the community with a general picture of their types and suspected causes which is quite compare to that found in Saudi Arabia, a multistage sampling method was applied to screen children in 875 houses using the ten questions survey tool for identification of disabilities. Further information collected for detected disabilities possible risk factors, cause of the disability as perceived by the family and services previously provided to the child. Results: A total of 137 cases of disability were detected giving a point prevalence rate of 36.7 per 1000 children. Twenty-nine children (21.2%) were discovered for the rest time during the survey. The majority of cases were male (57.7%) and the mean age for all cases were 10 years (SD⁻ 5.5) with no case detected under one year of age. Disabled children were in the fourth or fifth birth order among their brothers and sisters and 47 (34%)of them were recorded as a second or third disability in the same family. Number of disabilities in the same child varied widely: 59% of cases had a single disability, 22% had two conditions and 19% had three or more conditions.^{(17) (18)(19)}

Conclusions

The survey managed successfully to document a comparable estimate of the prevalence rate for childhood disabilities in the community and provided a general picture of their types and suspected causes. It also reported a low service delivery for these disabilities and

identified some risk factors related to their occurrence. To apply this survey method in Basra city is justified in an extended field study with certain modifications to suit the local culture. This study also should be complemented with a second stage referral for follow up examination of detected cases of and evaluation of the disability and its required services.

Expression of e-NOS in Human Placentas of Idiopathic Intra Uterine Growth Restriction at Term

Mohammed E. Ghanem¹, Samia A. Eleiwe²

¹Department of Anatomy, Histology & Embryology, ²Asst. Lect. Dr. Faculty of College of Medicine, Al-Kindy College of Medicine, Baghdad University, Baghdad, Iraq

Abstract

Endothelial nitric oxide synthase (e-NOS) is a chemical agent that involves in placental angiogenesis. It is conveyed through embryogenesis. In the contemporary study, we intended to examine the character of placental angiogenesis in the progress of intrauterine growth restriction (IUGR) by means of matching the levels of expression of e-NOS in normal-term pregnancy and IUGR placentas. Angiogenesis is one dominant factor in normal embryogenesis and hence the wellbeing of the newborn. The expression of e-NOS was planned using the streptavidin-biotin-peroxidase technique in placental tissues identified as normal (n = 33) and IUGR (n = 33) cases from mothers looking apparently normal. All were chosen at term pregnancy and obtained between 2nd of February of 2018 and 31th of January 2019 at selected hospitals. Outcomes were appraised semi-quantitatively. The expression of e-NOS marker as an immunohistochemistry total score and staining percentage were significantly greater ($p < 0.05$) in epithelial surface, smooth muscle cells of fetal vessels and the connective tissue terminal villous core of the IUGR placentas when matched with placentas collected from normal pregnancies at term. Encountered placental histochemical changes regarding the expression of the e-NOS angiogenic factor for idiopathic IUGR newborns raised the suspicion of that, it was caused by pure placental factors and could represent further requirement for Nitric Oxide to dilate fetal vessels to optimize functional requirement during placental insufficiency. The noticed Increased expression of e-NOS may be the result of inadequate uteroplacental perfusion supporting the proposal that abnormal angiogenesis plays a role in the pathophysiology of IUGR.

Keywords: Idiopathic Iugr, E-Nos, Placenta, Terminal Villi, Immunohistochemistry.

Introduction

Intrauterine growth restriction/retardation (IUGR) is a complex placental vascular disorder resulting in limited weight at birth, preterm delivery, with highly expected perinatal morbidity and mortality¹⁻⁴. IUGR could be triggered by different fetal, maternal, and placental influences^{1-3,5}. Angiogenesis is regarded as a placental factor acting essentially in the development of IUGR^{2-4,6,7}. Angiogenesis involves the branching of new microvessels from present larger blood vessels. It is an imperative aspect in normal embryogenesis⁸⁻¹⁰. Angiogenesis affects greatly the development of the villous vascular tree and the development of chorionic terminal villi. Placental vascular branching early in embryonic life and continues all over gestation^{9,11}. Precise angiogenesis up regulators and down regulators adjust this process^{4,8,9}. Fetal growth restriction happens because of the failure of elongation, branching,

or dilatation of the capillary circulation of terminal villi⁴. e-NOS has been acknowledged as stimulator for angiogenesis⁸. It is highly expressed throughout embryogenesis and fetal development^{1,6,10,12}. It synthesizes nitric oxide (NO) solely in the placenta^{13,14}, signifying that e-NOS is in charge for the increased NO in the placenta. e-NOS is chiefly accountable for the propagation of NO in the vascular endothelial layer of fetal vessels in the placenta^{15,16,17}. The e-NOS-derived NO is likewise a strong vasodilator compound in the perfused fetoplacental vasculature which is empowered by smooth muscles¹⁸, that is essential for the upkeep of decreased resistance at the fetoplacental interface¹⁹. Initial revisions have demonstrated that drug conveyed e-NOS suppression results in signs resembling preeclampsia and growth restricted fetuses in rats²⁰⁻²⁵.

Patients and Methods: This work was carried out through Department of Anatomy, Medical Faculty,

University of Al-Mustansiriyah, in assistance of Gynecology and Obstetrics department at Fatima Al-Zahraa Administrative Hospital, Al- Khadhraa Private Hospital and Al- Yarmook Teaching Hospital in Baghdad, Iraq. Permitted by the scientific committee of each of these medical institutes. A total of 66 mothers, along with their newborns and placentas were incorporated in this study. All were chosen at term pregnancy (of 38-40 weeks), they were non-smoker, non-diabetic, normotensive apparently healthy and normal women according to their history, clinical assessments, laboratory tests and ultrasound check. Fetal state as IUGR likewise was verified by Doppler ultrasonic exam without apparent fetal anomalies. Any mother suffered from difficult or delayed labor been ruled out from this work. A consent was gained verbally from each mother to be a component of this work. All fetal IUGR was considered to be idiopathic, given that there were no apparent maternal nor fetal basis. Placentas were assigned into two groups. The 1st embraced 33 placentas of newborns having normal average body weight (Control), whereas the 2nd group holds 33 placentas of newborns having idiopathic IUGR based on the basis of a valued fetal weight of less than the gestational tenth percentile, decreased amnion, and proved diminished end diastolic flow velocity of the umbilical artery by Doppler study confirmed by successive obstetric ultrasound examination²⁶. Every tissue block measured roughly 1×1×1 centimeter to be fixed to be stained by Immunohistochemistry e-NOS marker. Then, from every tissue block five sequential sections of about 4 µm thicknesses were obtained and were collected on positive charged slides. After de-waxing, the sections were rehydrated gradually. Immunohistochemical staining achieved by the avidin-biotin-peroxidase technique. 3% hydrogen peroxide blocking agent was used to block Endogenous peroxidase. Kept in oven for 15 minutes in sodium citrate buffer solution (pH=6.0) for antigen retrieval. Rabbit polyclonal antibodies reactive with e-NOS (Abnova) was added to the sections and incubated for one hour at room temperature. Sections were washed with phosphate-buffered saline with Tween, then a secondary antibody added for 20 minutes and after that with a biotin-streptavidin complex for half an hour at room temperature. 3,3-diaminobenzidine tetrahydrochloride (DAB) was used to visualize reaction. Finally, the sections were counterstained with hematoxylin and mounted. The intensity and localization of the staining reaction in Syncytiotrophoblasts

(epithelial cells), vascular smooth muscle cells (vessels) and chorionic villous stromal connective tissue cells (C.T.) were calculated by two pathologists blinded to the drive of the study. Immunohistochemical reaction of e-NOS antibody scored semiquantitatively for intensity of staining: 0 / negative = no staining, 1+ = weak positive, 2+ = moderately positive; 3+ strongly positive. The total score of immunohistochemistry staining obtained from multiplying the staining intensity with staining percentage for each region in high power field. Statistical analysis achieved by using SPSS v24. Continuous variables were illustrated as mean ± SD and the categorical variables were demonstrated in percentages. Chi-square test was used to compare groups for immunohistochemical outcomes. P - values < 0.05 were considered statistically significant.

Results

e-NOS immunohistochemistry cytoplasmic staining was perceived from both control and idiopathic IUGR tissues (Table 1, and Figures 1,2 and 3). A highly significant increase in the expression of e-NOS in IUGR placentas seen in syncytiotrophoblasts (epithelial cells) when compared to control group with p value = 0.003, Also, increase in staining percentage in the IUGR group but no statistical significance with p value = 0.077 difference when compared to the control groups. Regardless, the total score of e-NOS marker in epithelium was significantly higher in IUGR group than that in control groups (p = 0.004). regarding the fetal vessels, the staining intensities of e-NOS marker were significantly higher in IUGR group with p value = 0.02 when compared to the control group. Staining percentage of e-NOS marker in vessels was also significantly higher in IUGR group than that in control groups with p value =0.016. The foregone total score of e-NOS marker in vessels was significantly higher in IUGR group than that in control groups with p=0.011. Regarding the expression of e-NOS in the connective tissue of the villus core of terminal chorionic villi revealed statistically significant increase in intensity in IUGR group when compared to the control group with p value = 0.001. The staining percentage was also significantly higher (p=0.001) and the staining score is also significantly higher in IUGR when compared to control group (p=0.007).

Figure (1): Difference in staining intensity of e-NOS between IUGR & Control tissues (* p value <0.05)

Figure (2): Difference in staining percentage of e-NOS between IUGR & Control tissues.

Table (1): Difference in staining total score of e-NOS between IUGR & Control tissues.

localization		Mean	Std. Deviation	p Value
Epithelial	Control	1.0	± 0.82	0.004
	IUGR	1.62	± 0.86	
Vessels	Control	0.27	± 0.5	0.011
	IUGR	0.61	± 0.62	
C.T.	Control	0.21	± 0.51	0.007
	IUGR	0.58	± 0.55	

Figure (3): e-NOS staining reaction expressed in terminal villi of placenta, A; showing weak e-NOS staining in control group, B; showing e-NOS stronger expression in idiopathic IUGR group (DAB, A; B; × 400).

Discussion

Many previous studies had documented that a pure placental factor was the solitary cause in some IUGR cases²⁷. IUGR incidence was noticed 3% regarding developed countries, though, it scopes 15-20% in developing countries, it partakes in more than 26% stillbirths and congenital anomaly^{1,4,5}. Not to forget it yields many lasting health issues for grownups²⁸. Therefore, the precise diagnosis, and proper management of IUGR-complicated pregnancies are important. Regarding e-NOS expression in the epithelial cells, our results differ from the study of Myatt et al (1997)²⁹ as they had found no differences in the intensity or type of staining. Regarding the fetal vessels, our results agree with Myatt et al (1997)²⁹ and Rutherford and colleagues (1995)³⁰. However, other authors have found decreased levels of e-NOS in vessels in these condition like Giannubilo et al. (2008)³¹ and Noris et al. (2004)³². We hypothesize that the increased e-NOS expression in their vessels is not a disease-specific feature, but perhaps an adaptive response to increased resistance and poor perfusion. It seemed to be no previous works measured the expression of e-NOS in the villus core of terminal chorionic villi of term placenta neither in normal nor in pathological cases like IUGR. The significant elevation in expression of this enzyme, e-NOS, in this region particularly could be explained by its rapid diffusion from endothelial cells to the core, it had been found that it down regulates fibroblast production to decrease villus fibrosis decreasing the fibroblastic activity³³ which in turn reducing the density of the villus core to enhance feto-maternal exchange. It is possible that increased expression of e-NOS seen in our results in idiopathic IUGR placentas at term in all mentioned regions impinge upon regulation of placental vascular reactivity by the smooth muscle of fetal vessels and hence blood flow regulation. In support of this, it had been shown that concentrations of nitrate, a breakdown product of NO, were significantly higher at delivery in umbilical venous blood from idiopathic IUGR pregnancies compared with controls³⁴. The observed increased expression of e-NOS that we saw in placentas of Idiopathic IUGR could encourage pathological angiogenesis³⁵.

Conclusion

Toward elucidate the pathogenesis of idiopathic IUGR and the associated placental vascular insufficiency, it is needed to clarify the regulatory mechanism of placental vascular development. The noted increased

staining expression of e-NOS designates pathological angiogenic action, due to lacking proper uteroplacental perfusion, resulting in the formation of idiopathic IUGR.

Ethical Clearance: was approved and granted from Al-Mustansiryia University, Al-Rusafa and Al-Karkh health Directorate application forms as a requirement to obtain PhD degree in Anatomy, Histology and Embryology. Research projects are reviewed and conducted ethically. This research is not published yet.

Source of Funding: This study was self-funded.

Acknowledgment: I would like to express my truthful gratefulness to my supervisor Dr. Samia A. Eleiwe for her generous assistance, grate support and continuous wise guidance throughout the course of this study. I am grateful to Dr. Ahmed Fakhir Hameed for always taking the time to help me, and patiently assisting me with my work.

Characteristics of Multidrug Resistant Tuberculosis in Minia, Egypt

Shimaa Anwer Emam¹, Eman Mahfouz Kasem², Amany Edward Sedhom²

¹Lecturer, ²Professor, of Public Health and Preventive Medicine Department, Faculty of Medicine, Minia University, Egypt

Background

Tuberculosis (TB) is a disease of great antiquity and has almost certainly caused more suffering and death than any other infection. A total of 40 patients were registered with a diagnosis of MDR-TB during 2010–2018 in Minia. The majority of patients were from rural areas (27; 67.5%) and male (27; 67.5%). Emergence of MDR-TB has the potential to be a serious public health problem in that necessitates strengthened TB control and improved continuous monitoring of therapy.

Keywords: TB; MDR-TB; Therapy

Introduction

TB is a major public health problem owing to its high risk of person-to-person transmission, morbidity, and mortality. TB still remains one of the major health miseries facing humans, particularly in developing countries (1).

Multidrug-resistant TB (MDR-TB) remains a public health crisis and a health security threat. World Health Organization estimates that there have been 558 000 new cases with resistance to rifampicin – the foremost effective first-line drug, of that – 82% had MDR-TB.

According to the latest WHO estimation the incidence of tuberculosis (per 100,000 people) in Egypt was reported at 13 in 2017 (2). Screening, diagnosis, notification, and registration of TB cases were implemented all over Egypt according to the National TB Strategy of the National Tuberculosis Control Program (NTP). One of the registration sites is Minia

Chest Hospital, Minia, Egypt where the current study was conducted.

Method

This was a hospital-based retrospective study conducted to detect the pattern of prevalence, risk factors and treatment outcomes among patients with multidrug-resistant tuberculosis (MDR-TB) in Minia, Egypt and involving a record review of patients with TB notified and registered in Minia Chest Hospital. Data of 40 MDR-TB cases reported from January 1, 2010 to December 31, 2018 were analyzed. The diagnosis of MDR-TB in Minia Chest Hospital is made in line with the National Egyptian TB Control Program Guidelines of the Ministry of Health (NTP). Sociodemographic characteristics, associated comorbidities, fate of outcome and regimens of previous antituberculous treatments received either category I (CAT1) (Isoniazid “H”, rifampicin “R”, pyrazinamide “Z”, ethambutol “E” with or without streptomycin “S” for 2 months followed by isoniazid and rifampicin for 4 months {2HRZE(S)/4HR}), category II (CAT2) (2HRZES/1HRZE/5HRE) were collected. Cured patient was defined as a patient who is smear-negative in the last month of treatment and on at least one previous occasion. Treatment completed was defined as a patient who has completed treatment but who does not meet the criteria to be classified as a cure or a failure. Death was defined as a patient who dies for any reason during the course of treatment. Treatment default was defined as a patient whose treatment was interrupted for two months

Corresponding author

or more. Treatment failure was defined as a patient who remained or became again smear-positive at five months or later during treatment or defined as a patient who was initially smear-negative before starting treatment and become smear-positive after completing the initial phase of treatment. Trend curve of prevalence rate of MDR-TB cases in Minia, Egypt from 2003 to 2018 was performed.

Limitation of the study

By using retrospective data there were unavailability of clinical data, radiologic and other laboratory investigations.

Statistical Analysis

Data analysis was performed using SPSS version 20 (IBM Corp. Released 2011. IBM SPSS Statistics for Windows, Version 20.0. Armonk, NY: IBM Corp. US). Crude and adjusted odds ratios (ORs) and their 95% confidence intervals (CI95) were calculated. A binary logistic multivariate model was applied to determine the independent predictors of the treatment outcome out of those factors that demonstrated significant association by bivariate analysis at a level of significance of $p \leq 0.05$.

Results

A total of 40 patients were registered with a diagnosis of MDR-TB during 2010–2018 in Minia. The majority of patients were from rural areas (27; 67.5%) and male (27; 67.5%). The mean age of the patients was 38 years

(SD \pm 14.3 years). Smokers represented 55% of patients. Married patients were 60% of patients (Table1).

Majority of patients received CAT1 treatment at home and about half of them were regular in treatment. The commonest side effects of drugs used in treatment of MDR-TB patients were GIT symptoms and peripheral neuritis as shown in (Table 1).

The adjusted odds ratios (OR) and 95% confidence intervals (CI) for the association between the combined effect of independent variables and the outcome variable (MDR-TB). These estimates were obtained by logistic regression analysis. Marital status, place of previous treatment, compliance and associated comorbidities were statistically associated with. Compliance to treatment was found to be the most important determinant (Table 2).

Regarding the associated co-morbidities, 2.5% of the included patients were positive for HIV, 17.5% of them had cardiac diseases, 25% were diabetics, 10% had HCV and 10% had chronic chest diseases (Fig. 1).

Patients completed treatment performed 37.5% and cases with favorable outcome were 22.5% while failure of treatment were only 5% (Fig.2).

The trend curves of MDR-TB and TB cases in Minia were decreasing in the years 2004, 2010, 2012 and 2018. The trend curves were increasing in the years 2005 and 2011 (Fig 3).

Discussion

Multi Drug Resistance Tuberculosis MDR-TB is a rapidly increasing public health problem with major socio-economic and individual consequences. The spread of MDR-TB can only be prevented by rapid identification of these cases and treatment with a combination of effective drugs ⁽⁵⁾.

In the present study, males constituted 67.5% while females represented 32.5%. This coincides with the epidemiological picture of tuberculosis where males spend more number of hours outdoor exposure and more challenging and hazardous working environments. Also this came in accordance with ⁽⁶⁾ who reported that the

percentage of MDR-TB among males was 75.9% and that of females was 24.1% in three different governorates in Egypt.

In this study, we found that 55% of MDR-TB patients were smokers and this coincided with that of ⁽⁷⁾ in El-Abbasia Chest Hospital who revealed that in MDR TB, smokers were 61.53% and non-smokers were 38.47% among MDR-TB cases.

In many countries, differences in MDR-TB prevalence rates between urban and rural areas have been described. In the current study, 62.5% of patients were from rural areas and 32.5% were from urban areas. A study by ⁽⁸⁾ has reported similar findings that 90% were

from rural areas and only 10% were from urban area in the Dakahlia governorate from 2006 to 2011. Increased MDR-TB cases in rural areas could be explained by poverty, bad social conditions, milk sanitation, and occupational exposure to infected animals.

In this study, the most common co-morbidity associated with MDR TB was diabetes. This result agreed with those of ⁽⁹⁾ who reported that the highest co-morbidity among MDR-TB patients was DM 29.9%. Also, it was matched with those of ⁽¹⁰⁾, who reported that the highest co-morbidity among MDR-TB patients was DM (18.3%) of the patients.

In the present study, cured patients were (22.5%), dead patients were (7.5%) and defaulters were (20%). This result was matched with those of ⁽¹¹⁾, who reported that (19.4%) were successfully treated, (20.9%) died, defaulted (13.4%). On the other hand, the result didn't agree with ⁽¹²⁾, who studied the outcome of treatment of MDR TB patients in Russia that 76.0% was cured. Again, the result didn't match with those of ⁽¹³⁾ who reported that 70.6% were cured in United Kingdom from 2004-2007. This difference might be due to patient compliance with treatment and regular drug in developed countries.

In the present study, 45% of patients suffered from gastrointestinal disorders. This result coincided with those of ⁽¹⁴⁾, who stated that the most frequent side effect of Anti TB drugs was gastrointestinal manifestations (64%). Also, this result agreed with those of ⁽¹⁰⁾, who reported that dominant adverse effect was gastrointestinal disorders (55%). Oppositely, the result did not coincide with those of ⁽¹⁵⁾ who reported that the highest adverse effects were ototoxicity 41.8%, psychological 21.3% and gastrointestinal 14%. This difference might be due to the fact that Törün study included 263 MDR TB patients who received individualized treatment for MDR-TB between April 1992 and June 2004 at Istanbul, Turkey and also the author said that the frequent and early occurrence of ototoxicity may be due to the extended exposure to amino glycosides and Capreomycin during or prior to MDR-TB treatment.

In the current study, the studied cases were resistant to CAT1 (rifampicin, isoniazid, ethambutol and streptomycin) represented 92.5%. This result agreed with the findings reported by ⁽¹⁶⁾ that 65% of patients were resistant to CAT1. Contrary to our results ⁽¹⁷⁾ in Bulgaria founded that only 52% of cases were resistant to CAT1 this high percent of acquired resistance may

be due to alcoholism, number of previous treatments and irregular treatments. A study by ⁽¹⁸⁾ reported that only 42.8% of patients in a tertiary hospital in India were resistant to CAT1. Such variation may be due to varied geographical distribution, circulating strain patterns, demographic, ethnic, and epidemiological differences.

In this study comorbidities increased risk of MDR-TB ($p=0.04$) and this was observed by ⁽¹⁹⁾ in South Korea who found that relapse with resistant strains and poor treatment outcome of MDR-TB was documented among comorbid patients. Active screening for diabetes and HIV among TB patients is suggested as a cost-effective measure to be incorporated within the TB control program.

Our study revealed that MDR-TB infection had a statistically significant association with patients place of previous treatment ($p=0.04$) and this is in agreement with study done in Addis Ababa, Ethiopia by ⁽²⁰⁾ on patients who visited health facilities ($p<0.005$). Compliance to treatment appeared to be a predictor for MDR-TB ($p=0.02$) and this finding was in agreement with a study by ⁽²¹⁾ in China ($p<0.005$), which requires strong commitment and collaboration among health organizations and greater compliance with TB treatment guidelines by service providers and patients.

In the present study, the trend curve of MDR-TB cases in Minia was decreasing in the years 2004, 2010, 2012 and this may be due to that the program of MDR-TB was approved and implemented in Egypt in the year 2003, by the Green Light Committee (GLC) ⁽²²⁾. The trend curve was increasing in the years 2005 and 2011 with more detection rate of drug resistant TB cases with drug susceptibility tests and increasing slum areas, low socioeconomic status and poor nutrition and political disturbance and 25th January revolution.

Conclusion

Emergence of MDR-TB has the potential to be a serious public health problem in that necessitates strengthened TB control and improved continuous monitoring of therapy. Emphasis on the need to complete medical records of patients in hospitals.

Declarations:

- There is no conflicts of interest and/or funding
- The paper has been read and approved by all authors.

- Ethical considerations: The study was approved by the ethical committee of the Faculty of Medicine, Minia University. Prior to data collection, official permissions were obtained from the authorities of Minia University Hospital. Following the ethical guidelines of epidemiological research, a written informed consent was taken from each participant.

- Data is available on request.

Ethical approval: Ethics approval to use, report, and publish the collected data was obtained from the administrator of Minia Chest Hospital. Patient information was anonymized and deidentified prior to the analysis. Research Ethics Committee at the Faculty of Medicine, Minia University, approved this study protocol.

Prevalence of Uncorrected Refractive Errors Among the Internally Displaced Schoolchildren in Iraq

Rafea Allawi Fayyadh¹, Noor Hussain Abady²

¹Department of Ophthalmology, College of Medicine, University of Fallujah, Iraq,

²Department of Ophthalmology, Fallujah Teaching Hospital, Iraq

Abstract

Purpose: The aim of this study was to estimate the prevalence of uncorrected refractive errors among the internally displaced schoolchildren in Iraq.

Method: A school-based cross-sectional study in the academic year of 2016-2017. Schoolchildren were selected from 8 primary schools for the internally displaced children in Kurdistan region, Iraq. All children underwent full ophthalmic examination, uncorrected visions were tested and cycloplegic refractions were done for children with visual impairment. Refractive errors in this study were determined by the results of the cycloplegic refraction.

Results: From 592 selected children, 94.7% had participated in our study, and 553 were eligible (age ranged from 6 to 12 years). The prevalence of refractive errors was 34.5%; 32.2% of them were uncorrected. The prevalence rates of myopia, hyperopia and astigmatism were 3.8%, 13.9% and 14.9%, respectively.

Conclusion: This study has found a high prevalence of uncorrected refractive errors among the internally displaced children in Iraq. This result represents an important health issue among those children, requiring major actions to tackle and resolve it.

Key-words: Internally displaced children, Cross-sectional study, Refractive errors, Prevalence, Iraq.

Introduction

Refractive errors (RE) affect a large proportion of the world's population, regardless of their age, gender and ethnicity [1]. According to the World Health Organization (WHO), uncorrected refractive error is considered as the leading cause of avoidable blindness and visual impairment worldwide, with estimated number of 12 million of schoolchildren aged 5 to 15 years worldwide affected [1, 2, 3]. Uncorrected refractive error has great impediment on the individual's education, personality development and career opportunities, along with its economic burden on society [1]. Therefore, the need for an effective screening programs to detect

individuals with refractive error is rising in the recent years. VISION 2020- The Right to Sight, is the global initiative set by WHO to prevent the visual impairment resulting from the uncorrected RE. One of its strategies is to include a simple visual acuity test into the school health programs, and to perform spectacles provision to children with significant refractive errors [4, 5]. Provision of appropriate spectacles is considered as a simple, cost-effective strategy in order to improve vision.

In Iraq, as a result of the violence and conflicts in the past decade, more than 1.7 million persons, including over 900,000 children, had fled their homes and are living in camps or homes in the Kurdistan region of the country [6]. To our best knowledge, there is no available published data or information regarding the prevalence of visual impairment among these internally displaced children. Therefore, this study aimed to draw attention to the on-going health problems of the internally displaced people by determining the prevalence of the uncorrected refractive errors among the displaced schoolchildren.

Material and Method

Study area and sampling

A cross-sectional school-based study was carried out among primary schoolchildren in the academic year of 2016 - 2017. The students were recruited from 8 primary schools for internally displaced children located in Kurdistan region, North Iraq. The study included all the cooperative students of both genders from these schools after obtaining informed consents from their parents or guardians. The age of students included in the study ranged from 6 to 12 years; since in Iraq, children enroll in the elementary schools at age of 6 years, and the duration of study is six years.

Ophthalmic Examination

All the medical procedures were performed by trained ophthalmologists and optometrists. Examination included full ophthalmic history, slit lamp examination, and uncorrected visual acuity (UCVA) using Snellen's (E letter) chart at 6 meters' distance. Those with UCVA of 6/12 or worse in the better eye were declared to have defective vision and were examined by cycloplegic autorefraction using (Topcon KR 8000), and appropriate spectacle corrections were given. Children already wearing spectacles at time of examination were also examined and any changes in refractive errors were noted. The visual acuity, types of refractive error and correction were noted down in a self-designed proforma.

Definitions

Normal vision was defined as UCVA of 6/9 or better in at least one eye. Visual impairment was defined as an UCVA of 6/12 or worse in the better eye. Refractive errors were classified into myopia, hyperopia and astigmatism. Myopia was defined as a spherical equivalent (SE) of ≤ -0.50 diopter (D), hyperopia as $SE \geq +2.0$ D, and astigmatism as a cylinder of ≥ 0.50 D.

Astigmatism was further classified into: simple myopic, simple hyperopic, compound myopic, compound hyperopic and mixed astigmatism.

Statistical Analysis

The prevalence of RE was calculated as the ratio of the number of subjects with RE to the total number of the children studied. The prevalence of different types of RE (myopia, hyperopia, and astigmatism) was presented as percentage. Microsoft excel package and SPSS software (IBM Version 23) were used for the data analysis.

Results

Study population

A total of 592 students from 8 primary schools for internally displaced children in Kurdistan region, Iraq, were recruited for this study. Of whom, 561 had participated in the study with a response rate of 94.7%. We excluded 8 cases from the data analysis because of poor cooperation and missed information. The remaining 553 subjects consisted of 287 males (51.9%) and 266 females (48.1%), Errors! Reference source not found. The age of the students ranged from 6 to 12 years. Mean age \pm SD of the participants was 7.31 ± 0.59 years, **Table 1**.

Vision and VA

Uncorrected visual acuity of 6/9 or better in at least one eye was found in 362 out of 553 students (65.5%). The prevalence of visual impairment (UCVA of 6/12 or worse) in the better eye was 34.5% (191 of 553). The results of the vision screening according to gender and age of the participants are shown in **Tables 1 and 2**.

Of the 34.5 per cent of this sample found to have UCVA of 6/12 or worse in the better eye, 32.2 per cent of them had refractive errors (178 of 553). The remaining 2.3 per cent (13 of 553) had UCVA of $\leq 6/12$ due to other ocular causes, see **Table 3**.

Table 1: Overall results of vision screening in schools of internally displaced students in Iraq by gender.

Gender	Screened students	Visual acuity 6/9 or better	Visual acuity 6/12 or worse
		Number (%)	Number (%)
Male	287 (51.9%)	173 (31.3%)	88 (16%)
Female	266 (48.1%)	189 (34.2%)	112 (20.2%)
Total	553 (100%)	362 (65.5%)	191 (34.5%)

Table 2: Overall results of vision screening in schools of internally displaced students in Iraq by age.

Age group (years)	Visual acuity 6/9 or better	Visual acuity 6/12 or worse	Total
	Number (%)	Number (%)	Number (%)
6 -7	161 (29.1%)	64 (11.57%)	225 (40.7%)
7 -8	70 (12.7%)	45 (8.14%)	115 (20.8%)
8 -9	56 (10.1%)	30 (5.4%)	86 (15.6%)
9 -10	57 (10.3%)	28 (5.06%)	85 (15.4%)
10 – 11	13 (2.4%)	18 (3.25%)	31 (5.6%)
11 - 12	5 (0.9%)	6 (1.08%)	11 (1.9%)
Total	362 (65.5%)	191 (34.5%)	553 (100%)

Table 3: Causes of visual impairment in the internally displaced schoolchildren in Iraq.

Causes	Number (%) of students with visual impairment
Refractive error	178 (32.2%)
Amblyopia	10 (1.8%)
Keratoconus	2 (0.3%)
Retinal disease	1 (0.2%)
Total	191 (34.5%)

Refractive errors

The overall prevalence of refractive error in the better eye was 32.2% of the studied sample (n = 178), **Table 3**. Of those 178 students with RE, only 18 (3.3%) wore spectacles during the time of the examination, and this making the prevalence of uncorrected RE was 28.9% in the examined schoolchildren (160 of 553). **Tables 4 and 5** are showing the prevalence of refractive error types distribution according to gender and age of the examined schoolchildren.

The overall prevalence of hyperopia was 13.9% (n = 77). Myopia was detected in only 3.8% of the studied sample (n = 21), and the prevalence of astigmatism was 14.5% (n = 80). In case of astigmatism, mixed astigmatism was the most prevalent type (6.7%) of the total studied cases, followed by compound hyperopic astigmatism (3.6%) and compound myopic astigmatism (2.4%), **Table 6**.

Table 4: The prevalence of myopia, hyperopia and astigmatism by gender.

Type of refractive error	Gender		Total Number (%)
	Male Number (%)	Female Number (%)	
Myopia	9 (1.6%)	12 (2.2%)	21 (3.8%)
Hyperopia	25 (4.5%)	52 (9.4%)	77 (13.9%)
Astigmatism	41 (7.4%)	39 (7.1%)	80 (14.5%)
Total	75 (13.5%)	103 (18.7%)	178 (32.2%)

Table 5: The prevalence of myopia, hyperopia and astigmatism by age.

Age (years)	Type of RE			Total Number (%)
	Myopia Number (%)	Hyperopia Number (%)	Astigmatism Number (%)	
6 – 7	1 (0.2%)	32 (5.7)	27 (4.9%)	60 (10.8%)
7 -8	5 (0.9%)	17 (3.1)	20 (3.6%)	42 (7.6%)
8 -9	2 (0.4%)	14 (2.5)	12 (2.2%)	28 (5.1%)
9 -10	5 (0.9%)	7 (1.3)	14 (2.5%)	26 (4.7%)
10 -11	5 (0.9%)	5 (0.9)	5 (0.9%)	15 (2.7%)
11 -12	3 (0.5%)	2 (0.4)	2 (0.4%)	7 (1.3%)
Total	21 (3.8%)	77 (13.9%)	80 (14.5%)	178 (32.2%)

Table 6: Type and distribution of astigmatism by gender.

Type of astigmatism	Gender		Total Number (%)
	Male Number (%)	Female Number (%)	
Simple myopic astigmatism	5 (0.9%)	3 (0.5%)	8 (1.4%)
Simple hyperopic astigmatism	0	2 (0.4%)	2 (0.4%)
Compound myopic astigmatism	8 (1.4%)	5 (0.9%)	13 (2.4%)
Compound hyperopic astigmatism	9 (1.6%)	11 (2%)	20 (3.6%)
Mixed	16 (2.9%)	21 (3.8%)	37 (6.7%)
Total	41 (7.4%)	39 (7.1%)	80 (14.5%)

Discussion

This study was conducted to test the visual performance and estimate the prevalence of refractive errors in the internally displaced schoolchildren in Iraq.

In general, in this study, refractive errors were found in 32.2 per cent of the examined students. Results of refractive errors prevalence studies throughout the worlds vary widely. In Iraq, the prevalence of refractive errors among schoolchildren has been studied in a limited number of studies; in Amara city was (47%) [7], in Thiqr governorate was (35%) [8], in Erbil governorate was (25%) [9], and in Massif Kurdistan was (23.33%) [10]. In other studies around the world, refractive errors prevalence among children were; (26.67%) in Iran [11], (18.6%) in Saudi Arabia [12], (22.1%) in Egypt [13],

(20.9%) in India [14], (6.3%) in Ethiopia [1], (12.8%) in China [15], (46.8%) in Australia [16], and (79 %) in the Unites States [17]. This wide variation in the results could be explained by; the racial and genetic factors of the different countries [18], the difference in the sampling methods and by the sample size. Also, the age range of the children is different in each study. While in our study it was (6 - 12) years, other studies had older or younger age groups included.

Furthermore, 28.9 per cent of the internally displaced children with refractive errors were uncorrected, as only a small number of them wore corrective glasses. This can be explained by the fact that; as a result of the conflicts in their cities, many of these children never had a previous visual examination. Also, for those who had previously examined and prescribed spectacles, the low

compliance for wearing glasses came from social stigma and financial causes.

In this study, astigmatism was found as the more prevalent type of refractive error (14.5%) followed by hyperopia (13.9%), while the prevalence of myopia was (3.8%) among the examined schoolchildren. An explanation to these results could be by the fact that the majority of the studied children were at younger age (mean age around 7 years). Also, the prevalence of astigmatism could be explained by the high prevalence of dry eye and allergic conjunctivitis among the Iraqis children [10,19].

In conclusion, uncorrected refractive error was found to be an important health problem among the internally displaced children in Iraq. Major actions need to be taken by performing regular school-screening programs that provide corrective glasses at low costs or free to those who need them.

Conflict of Interest: Nil

Source of Funding: self-funded

Ethical Clearance: Ethical approval for this study was obtained from the Scientific Committee of University of Fallujah / College of Medicine before any measurements were carried out. The school principals also approved this study. Written informed consents were obtained from the children's parents or guardians.

The Influence of Additional Food Hotong Porridge with Moringa Leaves Mixture on Improvement Nutritional Status of Children Nutritional Children

Rahma Tunny¹, Merryana Adriani², Bambang Wirjatmadi²

¹Master Student, ²Professor, Faculty of Public Health, Airlangga University

Abstract

Malnutrition is one of the main nutritional problems in Indonesia. Toddler is one of the age groups that are vulnerable to nutritional problems. One of the causes immediate nutritional problem is a lack of energy. This study aims to analyze the effect of supplementary feeding (PMT) hotong porridge mixed with moringa leaves and government biscuits on weight gain and underweight nutritional status in the working area of the Five Public Health Center. This study used Randomized Controlled Trial Design, with a quasi-experimental approach. The distribution of PMT hotong porridge with Moringa leaf mixture as a treatment group and the administration of PMT biscuits by the government program as a control group. The sample size was 32 toddlers. Data were analyzed using paired-sample T test. There was a significant effect on body weight and nutritional status after administration of PMT hotong porridge with moringa leaf mixture and PMT biscuits of government programs with p-value of 0.001 in the treatment group and the control group. Hotong slurry feeding and biscuit mix Moringa leaves government programs throughout a period of 30 days to take effect on the increase in body weight and nutritional status of children on the mark with most of the value of z-score infants already stood at -2SD s/d +2SD, which means that most of the children under five are already in the nutritional status of the mall.

Keywords: Toddler, Weight, PMT, Nutritional status

Introduction

Malnutrition is a condition of body weight according to age (weight/age) not in accordance with the age that should be⁽¹⁾. Malnutrition at the age of 2-5 years can affect mental development (ability to think). The brain reaches its maximum shape at the age of two years, malnutrition at this age can result in disruption of brain function permanently and malnutrition in general causes disruption in the processes of growth, energy production, body defense, structural behavior and function⁽²⁾

Based on the results of Riskesdas, the prevalence of underweight by province and national is 2018 by 17.7%

Corresponding author:

Merryana Adriani

E-mail: adrianimerryanafkmunair@gmail.com

Address: Kampus-C UNAIR, Mulyorejo, Surabaya-Indonesia

including poor nutrition by 3.9% and under nutrition by 13.8%. When compared with the national prevalence rate in 2007 (18.4%), in 2010 (17.9%) and in 2013 it was 19.6%. Maluku Province is one of nine provinces with a high prevalence of severe under nutrition (24.9%)⁽³⁾. In 2016 the incidence of malnutrition in Central Maluku district showed a figure of 5.1% in 2017 (4.5%) and in 2018 (4.5%)⁽⁴⁾

One direct cause of malnutrition is low nutrient intake⁽¹⁾. Nutrient intake can be obtained from macro nutrients such as energy, protein and fat needed in large quantities by the body and plays a role in providing energy⁽²⁾. One ingredient food of high nutritional value, especially energy and protein is hotong. Hotong (*Setaria Italica (L) Beauv*) is a type of cereal crops sorghum. This plant is not widely known by the people of Indonesia and its processing is still limited.

Hotong plants grow widely in the Buru island area of Maluku and are used as staples with cassava, sago, corn,

and rice. Hotong content high enough seed nutrients are carbohydrates (84.02%), protein (14.05%), fat (3.3%), 100 grams of seeds contain energy hotong huge 359 calories⁽⁵⁾. Moringa leaves also have a main source of several nutrients and therapeutic elements including antibiotics that stimulate the immune system. Moringa leaves have a high content of protein, vitamins and minerals that are good to be used as additional food for malnourished toddlers⁽⁶⁾.

Method

This research was a quasi experimental study with Randomized Control Trial Design. The sampling technique was simple random sampling. The sample were stunting as many as 32 people consisting of 16 infants in the treatment group and 16 infants in the control group with the inclusion criteria, namely children aged 24-59 months who suffered less nutrition with weight/age. z-score $-3SD$ up to $<-2SD$, no disease, infants who are not breastfed and are willing to be respondents. This research was conducted for 30 days from 10 May to 10 June 2019 in the working area of the Public Health Center "Lima", Central Maluku. The independent variable was the administration of PMT hotong porridge mixed with moringa leaves and biscuits, the dependent variable was weight and nutritional status. PMT hotong porridge was given to the treatment group as much as 120 grams with 324 kcal energy and 10 grams protein and biscuits PMT were given to the control group as much as 120 grams (12 pieces/day) with 300 kcal energy and 8.45 grams protein.

Toddler characteristics in this study consisted of age and gender. Family characteristics include the

number of family members and family income. Primary data were obtained from body weight measurements using digital scales with 0.01 kg-accuracy, interviews with questionnaires and food recall form 1x24 hours. Secondary data were the number of malnourished children under the age of 24-59 months registered in the working area of the public health center "Lima".

The results of measuring under-fives weight use the weight/age index and compared with the z-score and are classified into 2 categories: malnutrition if included in the category of under nutrition and good nutrition and over nutrition if included in the category of good nutrition and over nutrition. Energy, protein and Fe intake compared with the cut of point Estimated Average Requirements (EAR), namely the deficit category if $<70\%$ RDA, less if $70-80\%$ RDA, while if $81-90\%$ RDA and good category if $91-100\%$ RDA .

To see the effect of energy, protein, and Fe intake on body weight and nutritional status of toddlers the paired-sample T test.

Findings

Characteristics of toddlers and families in table 1 shows that most of the toddlers in this study were aged 24-36 months in both the treatment group of 12 toddlers (75%) and the control group of 11 toddlers (68.75%). This age group is usually vulnerable to nutritional problems such as underweight, stunting and wasting. Toddlers aged 2 years have also entered the weaning period and have adopted the same diet with other families so that food intake is very important to support the growth process of infants⁽⁷⁾.

Table 1. Distribution of Toddler and Family Characteristics

Characteristics	Treatment		Control	
	n	%	n	%

Rarely (\leq 4 people)	9	56.2	11	68.8
Total	16	100	16	100
Family Income				
<UMK	16	100	12	75
\geq UMK	0	0	4	25
Total	16	100	16	100

The sex in this study were mostly women, both in the treatment group of 8 toddlers (50%) and the control group of 11 toddlers (68.75%). Research in Ghana states that girls are more at risk of nutritional problems compared to boys. That is because in parenting, diet and care, boys take precedence over girls⁽⁸⁾.

The number of family members in this study mostly had sparse family members (\leq 4 people), namely in the treatment group of 9 toddlers (56.25%) and the control group of 11 toddlers (68.75%). This shows that the number of members in a family can influence the less optimal distribution and level of food consumption. Families with a large number of family members tend to get less food available. Lack of food availability in a long time can affect the low level of food consumption and have an impact on malnutrition⁽⁹⁾.

The level of family income in the treatment group (100%) and the control group (75%) <UMR. Family income is one of the socio-economic indicators that play a role in providing food and family eating patterns. Low income can be one of the factors causing underweight nutritional status in infants, if the amount of income is low, then the level of food expenditure is also low so that it can cause low purchasing power and availability of food that contributes to the level of suboptimal nutritional consumption⁽¹⁰⁾.

Prior to PMT administration, most toddlers experience a deficit in food intake. In the treatment group namely 14 toddlers (87.50%) deficits in energy

intake, 5 toddlers (31.25%) deficits in protein intake and 9 toddlers (56.25%) had deficits in Fe intake.

The control group most of the toddlers experienced energy intake deficits namely 12 toddlers (75.0%), 4 toddlers (25.0%) had a protein intake deficit and 12 toddlers (75.0%) had a deficit in Fe intake.

In the treatment group, the level of energy intake deficit was reduced to 2 toddlers (12.50%), the level of protein and Fe intake decreased deficits so that there was no deficit intake of toddlers.

In the control group, there was a decrease in the deficit energy intake to 6 children under five (37.50%). The majority experienced an increase in the level of protein intake, namely 6 toddlers (37.50%) and Fe deficit intake increased to less intake, namely 9 children under five (56.25%).

The test results differ in levels of energy, protein and Fe consumption between the treatment group and the control group after PMT administration with p-value = 0.007. Previous research stated that there was a change in the level of energy consumption in the treatment and control groups after the administration of PMT by p=0.008⁽¹¹⁾. This study is other states that people with a less risky energy consumption 6.73 malnutrition was comparable to the n that the energy consumption enough⁽¹²⁾.

The effects of energy, protein and Fe intake on body weight and nutritional status before and after PMT administration are presented in table 4.

Table 2. Effects of Energy, Protein and Fe Intake on Body Weight and Nutritional Status Before and After Giving PMT

Average	Treatment		Control	
	Before	After	Before	After
Energy (%)	65.49	80.03	66.60	71.00
Protein (%)	79.53	95.88	85.27	86.61
Fe (%)	72.00	81.32	69.37	76.40
BW (kg)	7.93	10.06	8.05	8.95
Z-Score	2.58	3.86	2.02	2.93

Table 2 showed that the treatment group or the control group increased intake of energy, protein and Fe. In the treatment group, the intake of energy, protein, Fe, body weight and nutritional status increased after administration of hot porridge mixed with moringa leaf.

The results of different tests of energy intake, protein intake and Fe intake on body weight and nutritional status before and after PMT administration showed significant differences, namely in the treatment group $p=0.001$ and the control group $p=0.039$ and $p=0.001$.

Discussion

Effects of Moringa Leaf Hotong Slurry Supplement Supplementation for Weight Loss

PMT hotong porridge with moringa leaf mixture is a snack made from several specific ingredients, as the main ingredient of hotong flour and Moringa flour with a comparison of certain nutritional levels in order to obtain high nutritional value. Consumption hotong flour and flour of Moringa is alternative way to promote weight loss nutritional status of stunting.

Hotong has several advantages compared with rice, nutrients are protein on hotong 3 times greater (13.05g) of protein in rice (5.0 g), carbohydrates at hotong of 84.02 cal and at 70-80 cal rice and fat in hotong 3.37 grams greater than fat in rice that is 1.0-2.0 g⁽⁵⁾.

Moringa leaves also have several advantages including vitamin C in moringa is equivalent to 7 times vitamin C in citrus fruits, 4 times calcium in milk, 3 times potassium in bananas, 2 times protein in yogurt, 4 times vitamins in carrots and 25 times iron in spinach⁽⁶⁾.

Moringa leaves also contain 46 antioxidant compounds that protect the body against the damaging effects of free radicals by neutralizing them before they can cause cell damage and disease.

The results of the study are known before giving hotong porridge the mixture of Moringa leaves the average value of body weight is 7.93 kg and after administration of hotong porridge the mixture of Moringa leaves the average value of a toddler's body is 10.06 kg, meaning that there is an increase in toddler body weight after the administration of hotong pulp mixed with moringa leaves in the treatment group was 2.13 kg (8.50%)

Hotong porridge mixed with moringa leaves can be used as an alternative intake of morning uptake with complete nutritional content. by consuming 1 plate or 120grams of hotong porridge mixed with moringa leaves can be fulfilled energy by 27.07% of RDA and protein 33.35% of RDA with the fulfillment of energy and protein intake in a day can increase weight gain in infants.

Earlier research stated that the more increased administration of Moringa leaves were added, the higher the content of protein, sugar, calcium, fiber content and β -carotene. This allows good absorption of nutrients contained in hotong and Moringa leaves⁽¹³⁾. Other studies also stated that the body weight of children who received average Moringa leaf powder was higher (8.9 \pm 4.30 g/kg/day compared to 5.7 \pm 2.72g/kg/day in group II) and the level recovery is faster with an average stay time of 36 \pm 16.54 g/kg/day compared to 57 \pm 19.20 g/kg/day for those who do not receive Moringa supplements⁽¹⁴⁾.

Other research states there is an effect of energy intake and protein intake on the addition of BB and TB under five after giving Moringa BMC PMT for 30days. The results of the analysis of energy intake and protein intake on BB and TB before and after giving BMC Moringa get the average value of BB before 10.29 kg and BB after 11kg. The average TB value before giving BMC Moringa PMT 88.12 cm and TB after an average of 89.16 cm⁽¹¹⁾.

The results of the difference between body weight before and after PMT administration showed a significant difference with a value of $p=0.001$.

The Effect of Supplementation of Moringa Leaf Hotong Porridge Supplement Against Nutritional Status

The results showed that the nutritional status of the treatment group prior to the administration of hotong porridge with Moringa leaf mixture was lacking nutritional status-the average nutritional status of children under five was 2.58kg and after administration of hotong porridge with Moringa leaf mixture the average value of nutritional status was 3.86kg. meaning that an increase in nutritional status after the administration of hotong porridge mixed with Moringa leaves by 1.28 kg

In the control group before administration of government program biscuits the average nutritional status was 2,02 whereas after administration of government program biscuits the average nutritional status was 2.93. This means that an increase in BB of 0,91.

Statistical test results showed that there were significant differences before and after the administration of hotong porridge mixed with moringa leaves ($p=0.001$) and government program biscuits with a value ($p=0.001$) on nutritional status. From the results of the study, samples that were given supplementary food both hot moringa mixed porridge with leaves and biscuits during the government program for 30days increased nutritional status, and the most effective improvement in nutritional status was supplementary feeding of hotong porridge mixed with moringa leaves.

Increasing the nutritional status of children under five is influenced by good food intake. Meeting the nutritional needs of children under five is the fulfillment of food intake that contains important compounds needed by the body of a toddler, including calories,

protein, vitamins and minerals in accordance with their age. So at the age of five, balanced nutrition is needed so that the growth and development of toddlers can run well.

Conclusion

There is an effect of the administration of PMT hotong porridge with moringa leaf mixture and PMT biscuit of government programs to increase body weight and nutritional status of under-fives nutrition.

Suggestion is that the hotong porridge mixed with moringa leaves can be considered as an alternative for breakfast as a substitute for rice porridge,so as to reduce the incidence of malnutrition in infants.

The Stiffness Comparison of Four-Screw versus Six-Screw Short Segment Pedicle Posterior Stabilization Instrumentation in Cyclic Axial Compression

Reza Rahman R¹, I Ketut Martiana¹

¹Department of Orthopaedics and Traumatology, Faculty of Medicine, Dr. Soetomo Teaching Hospital, Universitas Airlangga, Surabaya 60285, Indonesia, Corresponding author : I Ketut Martiana

Abstract

Background: Thoracolumbar burst fracture required to conduct short segment posterior stabilization as the operative therapy. The short segment fixation (above and under fracture level (four-screw pedicle)) encounters loss of correction and failure including progressive kyphosis, screw pedicles and rods that are bent or fractured. Rod around fracture site receives bigger loads than other parts due to its function as cantilever. To overcome this, it uses short-segment posterior stabilization instrumentation in which pedicle screw is installed above, under, and on fracture site level (six-screw pedicle) to increase stiffness.

Objective: To analyze the comparison stiffness of four-screw versus six-screw short segment pedicle posterior stabilization instrumentation in cyclic axial compression.

Method: This study used in vitro mechanical test in simulation of vertebrae from UHMWPE (Ultra High Molecular Weight Polyethylene) that was fixated with four-screw and six-screw pedicle. Each construction is given cyclic axial compression. Afterwards, the stiffness of each construction was measured.

Results: Six-screw short segment pedicle posterior vertebrae stabilization instrumentation had higher stiffness of 43.38% than four-screw short segment pedicle posterior vertebrae stabilization instrumentation in cyclic axial compression. There was a significant difference in both groups ($p < 0.05$)

Conclusion: Six-screw short segment pedicle posterior vertebrae stabilization instrumentation was better than four-screw short segment pedicle posterior vertebrae stabilization instrumentation in cyclic axial compression.

Keywords: *In vitro mechanical test, thoracolumbar burst fracture, six-screw short segment pedicle, four-screw short segment pedicle, cyclic axial compression, stiffness*

Introduction

In Indonesia, the case of spinal cord injury has commonly occurred. Spine fracture therapy can be performed either operatively or nonoperatively. The goal of spinal fracture therapy is to restore stability, reduce pain and correct deformity. The variety of therapy instrumentations that are currently used are SRSSI, PSP, and PSR (Pedicle Screw and Rod). Fixation with transpedicle screw is often used as a spinal instrumentation for the stabilization and correction of deformity caused by trauma, degenerative processes, tumors, and congenital abnormalities^(1, 2). The pedicle

screw system can provide instability treatment because of a burst fracture or tumor resection in the thoracolumbar⁽³⁾.

In the previous study on the short segment of four-screw pedicle, there was a change in kifotic angle post op of 2.0625 to 5.312 after 6 months, whereas in the short segment of six-screw pedicle, there was a change in kifotic angle post op of 1.000 to 1.333 after 6 months (4). The short segment fixation (above and under fracture level (four-screw pedicle)) encounters loss of correction and failure including progressive kyphosis, screw pedicles and rods that are bent or fractured. In

this case, if the construction is mounted a pedicle screw on the fracture site, it will overcome the problems (5). Several studies reported a 25% failure on lumbar or thoracolumbar fractures treated with instrumentation with short-segment pedicle screw(6). This is due to the short segment caused by the occurrence of axial instability that reflects the anterior and medial mechanical incompetence.

Several biomechanical studies are aimed to indicate the character of the spine in a physiological (non-injury) state, which includes a stiffness test or flexibility. The results of the study are described in the load displacement curve. Clinically, this series of instrumentation requires in vitro testing either in a plugged in synthetic material or cadaveric spine. The results of this biomechanical test provide information on tool stiffness, fatigue life and failure mechanisms to improve the instrumentation (7).

The researchers are intended to compare the stiffness by assigning a load to a cyclic axial compression force between the construction of four screw short-segment pedicles with six screw short segment pedicles on a vertebral simulation using polyethylene material.

Method

This research is an in vitro biomechanical test with true experimental. This method used Post test only control design, which distinguished two types of short-segment pedicle construction mounted on polyethylene (UHMWPE) material that resembles human spine with unstable fracture or (anterior and medial damage) and cyclic axial compression load. The first construction used four pedicle screw (pedicle screw mounted above and below fracture level) while the other type of construction used six pedicle screw (pedicle screw mounted above, below fracture level and fracture level).

The tool used was material testing machine servohydraulic type Schenck, 1990, made in Germany. Biomechanical tests on the vertebral simulation of polyethylene material was performed to compare the stiffness of a six-screw pedicle short-segment construction with four-screw pedicle short-segment construction in cyclic axial compression. The specimens were subjected to repeated loading on the top and downward direction in the sinusoidal function with cross head displacement of ± 1 mm. The frequency of displacement was 2 Hz in sinusoidal wave. The magnitude of this displacement was determined based on previous studies showing that displacement of 1 mm

provided a load to the pedicle screw equivalent to the load received during walking (8). The amount of load received is calculated; thus, the load displacement curve can be obtained to calculate the stiffness coefficient.

The measurement of the slope stiffness of the load displacement curve was carried out in the range of 10-90% from the 1000 cycles. It was intended to remove the pre-stress conditions received during insertion or tightening of the screw (8). This measurement was conducted four times; thus, each specimen has a total of 3000 cycles to recognize changes in the entire cycle. This test used a servohydraulic testing machine (ESH) composed of displacement transducer and compressive load-cell. The data collection of load displacement was conducted through analog to digital interface. Three groups of data obtained were time (s), displacement (mm), and load (N).

Two holes were made on polyethylene on the posterior side with 40 mm distances. Both holes had the same distance from the bottom surface of the block, which was 9 mm. The direction of the screw hole was perpendicular to the cut posterior surface; thus, it angles 15° anteromedial. Both holes were tapered 6.0 and mounted two monoaxial pedicle screw in each polyethylene block. The screw had 35 mm long from 316L stainless steel made by PT Marthys Indonesia. This study used two types construction: the first construction used two blocks of polyethylene by spacing between two blocks and the second construction used three blocks of polyethylene. Once tested, the polyethylene specimen can be reused only if visual inspection was not cracked, ebris due to the usage, or permanent shaping. Furthermore, the reduced torque strength can cause the polyethylene cannot be used.

Screw pedicle used had a head structure that can accommodate longitudinal rod, perform closure mechanism, and deformity correction. Closure mechanism is an important part because it has an effect on the rigidity of a construction. To see the actual strength of the construction, a scenario condition was created, in which the construction must support axial compression loads on both polyethylene blocks above and below. The statistical analysis was conducted by using ANOVA (Analysis of Variance) with $p < 0.05$ as the degree of significance. This study compared the stiffness between devices as well as between cycles; therefore, it was not possible to use t test.

Results

Based on the statistical test descriptively, the highest average stiffness of 6 screw pedicle after giving axial compression style of 500 N was 528.75 ± 32.50 N/mm in initial cycle (cycle 0). On the other hand, the lowest stiffness value in 3000 cycle was 431.25 ± 37.50 N/mm. In the results of axial compression of 900 N, the highest stiffness in initial cycle was 356.25 ± 71.80 while

the lowest stiffness in cycle 3000 was 137.50 ± 43.30 N/mm. The highest average stiffness of 4 screw pedicle after giving axial compression style of 500 N was 276.25 ± 16.52 N/mm in initial cycle (cycle 0). On the other hand, the lowest stiffness value in 3000 cycle was 243.75 ± 23.93 N/mm. In the results of axial compression of 900 N, the highest stiffness in initial cycle was 175 ± 95.74 while the lowest stiffness in cycle 3000 was 87.50 ± 25.0 N/mm.

Table 1. The multi-cyclic stiffness post compression force in pedicle screw installation

Treatment	Sample	Compression 500N				Compression 900N			
		Cycle	Cycle	Cycle	Cycle	Cycle	Cycle	Cycle	Cycle
		0	1000	2000	3000	0	1000	2000	3000
		(N/mm)	(N/mm)	(N/mm)	(N/mm)	(N/mm)	(N/mm)	(N/mm)	(N/mm)
6 pedicle screw	1	525.0	475.0	450.0	475.0	375.0	350.0	250.0	100.0
	2	515.0	485.0	475.0	450.0	400.0	225.0	200.0	175.0
	3	500.0	435.0	400.0	400.0	400.0	150.0	100.0	100.0
	4	575.0	450.0	410.0	400.0	250.0	175.0	150.0	175.0
4 pedicle screw	1	285.0	275.0	260.0	225.0	300.0	200.0	200.0	125.0
	2	295.0	285.5	275.5	260.0	100.0	75.0	75.0	75.0
	3	275.0	265.0	250.0	225.0	100.0	175.0	100.0	75.0
	4	300.0	270.0	250.0	250.0	200.0	175.0	100.0	75.0

The analytical statistic used Independent t-test. Mann-Whitney was performed to measure the average stiffness after giving the axial compression 500 N and 900 N in 6 screw pedicles and 4 screw pedicles. It was also repeated ANOVA test to understand the stiffness change along with cycle change (1000, 2000, dan 3000 N/mm) in both ways of installations.

Table 2. The comparison of stiffness mean in 6 pedicle screw and 4 pedicle screw (independent t-test)

Compression	Pedicle screw treatment	Stiffness mean (N/mm)	Difference percentage (%)	(p)
The comparison of stiffness mean in 6 pedicle screw and 4 pedicle screw post compression 500 N and 900 N (independent t-test)				
500 N	6 screw	463.75 ± 49.91	43.38	0.001
	4 screw	262.56 ± 19.11		
900 N	6 screw	223.44 ± 67.15	39.85	0.008
	4 screw	134.38 ± 66.38		
The comparison of stiffness mean each cycle in 6 pedicle screw and 4 pedicle screw post compression 500 N (independent t-test)				
0	6 screw	528.75 ± 32. 50	47.75	0.001a
	4 screw	276.25 ± 16. 52		
1000	6 screw	461.25 ± 22. 86	42.52	0.029b
	4 screw	265.12 ± 10. 95		
2000	6 screw	433.75 ± 37. 50	38.87	0.001a
	4 screw	265.12 ± 10. 95		
3000	6 screw	431.25 ± 37. 50	43.38	0.001a
	4 screw	243.75 ± 23. 93		
The comparison of stiffness mean each cycle in 6 pedicle screw and 4 pedicle screw post compression 900 N (independent t-test)				
0	6 screw	356.25 ± 71. 80	50.88	0.023
	4 screw	185 ± 95. 74		
1000	6 screw	225 ± 88. 97	30.56	0.238
	4 screw	156.25 ± 55. 43		
2000	6 screw	175 ± 64. 54	32.14	0.234
	4 screw	118.75 ± 55. 43		
3000	6 screw	137.50 ± 43. 30	36.36	0.104
	4 screw	87.5 ± 25. 00		

* Homogeneity test was performed using Levene test

a Analytical test using independent t-test parametric test

b Analytical test using non-parametric test Mann-Whitney test

It has been revealed that the average stiffness of 6

screw pedicles was higher than 4 screw pedicles with the percentage of 43.38% post compression of 500 N and 39.85% post compression of 900 N. It was a significant difference (p<0.05). The stiffness in 6 screw pedicles post giving axial compression of 500 N was higher than 4 screw pedicles of each cycle with the initial cycle

percentage of (47.75%) and it was considered significant ($p < 0.05$). The stiffness in 6 screw pedicles post giving axial compression of 900 N was higher than 4 screw pedicles of each cycle in the initial cycle and it was considered significant ($p < 0.05$). However, there was no significant difference in other cycles ($p > 0.05$).

The average stiffness of 6 screw pedicles had tendency to decrease along with increased cycle yet it was not considered significant ($p > 0.05$). The post hoc test of 4 screw pedicles showed that there was significant decreased stiffness from cycle 0 to 1000, as well as from cycle 1000 to 2000 ($p < 0.05$). However, there was an insignificant decrease of average stiffness in cycle 2000 to 3000 ($p > 0.05$). In general, there was decreased stiffness along with insignificant increased cycle with axial compression of 500 N in 3-level pedicle screw ($p > 0.05$). In addition, there was a decreased stiffness along with insignificant increased cycle in 4 pedicle screws ($p > 0.05$). Based on post hoc test in 4 pedicle screws, there was no statistically significant average stiffness in each cycle change ($p > 0.05$). It can be concluded that there was no significant decreased stiffness along with increased cycle with axial compression of 500 N in 4 pedicle screws ($p > 0.05$).

The average stiffness of 6 screw pedicle showed a tendency to encounter insignificant decreased along with increased cycle ($p > 0.05$). Based on post hoc test in 6 pedicle screws, there was no statistically significant average stiffness in each cycle change ($p > 0.05$). It can be concluded that there was no significant decreased stiffness along with increased cycle with axial compression of 900 N in 6 pedicle screws ($p > 0.05$).

The average stiffness of 4 screw pedicle showed a tendency to encounter insignificant decreased along with increased cycle ($p > 0.05$). Based on post hoc test in 4 pedicle screws, there was no statistically significant average stiffness in each cycle change ($p > 0.05$). It can be concluded that there was no significant decreased stiffness along with increased cycle with axial compression of 900 N in 4 pedicle screws ($p > 0.05$).

Discussion

To ensure the ability of instrumentation construction as a fixation of the spine, the implant construction must have genuine stiffness. Therefore, the stiffness should be measured to support and stabilize the spine until bone healing occurs in an instrumentation construction. Basically, the instrumentation construction has varying

stiffness due to the difference in load and the amount of cyclic received. It is due to the interspecimen slippage and microcrack in the implantable material. By using UHMWPE as a consistent fixation medium with the right size, the depth and placement of the implants can be made constantly ⁽⁹⁾.

This study protocol is a consistent and logical technique for the posterior spinal instrumentation biomechanical test. This method also provides evaluation base and biomechanical comparison of both constructions. In implant construction, the construction material and types affect the stiffness from the implant construction (10). Theoretically, the posterior stabilization of the short segment of six screw pedicles can increase the resistance and stabilization of the spine (13). In this study, in addition to the stiffness between the two constructions, we also observed the change of stiffness between cycles, so it can be found how strong the construction after being given increased cyclic axial compression cycle. This is in accordance with studies stating that the stiffness of an implant will vary according to the size of the load cycle received as a result of the intraspicemen slippage and microcrack occurring in the implant material (10, 12).

In this study, there was no broken construction on screw pedals and rods when the device was given cyclic axial load or upon inspection after the tool was removed. From the results of research using synthetic spine of UHMWPE material, it is found how big the difference of stiffness in both constructions is. The use of UHMWPE has the advantage of being a stable specimen in a research because it can be reduced to biological deterioration; therefore, it can be used as a consideration for deciding which type of construction will be used to deal with cases of spinal trauma. However, the value obtained does not mean exactly the same as if it is implemented on the patient directly. In the use to the patient, it still must be considered because there are many biological factors such as the age of patients, osteoporosis, the patient's nutrition, postoperative rehabilitation of the patient or the presence of comorbid diseases such as malignancy, and infection.

Conclusion

The six-screw short segment pedicle posterior vertebrae stabilization instrumentation was better than four-screw short segment pedicle posterior vertebrae stabilization instrumentation in cyclic axial compression.

Correlation of Aggressivity Papilloma Recurrent Respiratory Tract With Human Papillomavirus Types 6 And 11

Rizka Fathoni Perdana¹, Sri Herawati¹, Bakti Surarso¹, E Bimo Aksono H²

¹Department of Otorhinolaryngology, Faculty of Medicine-Dr. Soetomo General Hospital, Universitas Airlangga, Surabaya 60285, Indonesia, ²Institute of Tropical Diseases-Faculty of Veterinary, Universitas Airlangga, Surabaya

Abstract

Background : Recurrent respiratory tract papilloma (PSPB) is a viral disease that correlated with an airway exophthalmia lesion. Papilloma is primarily caused by human papillomavirus (HPV) types 6 and 11 which are classified as low-risk HPV. Reports indicate that patients with the HPV-11 experience more aggressive course of the disease than HPV-6. Patients are often diagnosed at a younger age, the longer duration, require more frequent surgery and rare diseases of the disease when compared with those caused by HPV-6.

Objectives : To investigate the correlation of aggressiveness of PSPB with HPV-6 and 11.

Methods : Fifteen samples were conducted in the Outpatient Unit of Otorhinolaryngology and the Lotus Inpatient Installation of Dr. Soetomo General Hospital from December 2012 to March 2013 then determine the disease aggressiveness. PCR examination was done at the Tropical Disease Institute of Universitas Airlangga. Aggressive correlation of disease with HPV type was tested using Chi-Square.

Results : Fifteen patients were enrolled that divided; the male was 10 and female was 5. The mean annual number of operations was 2.8 ± 1.27 and 9 patients reported more than 3 surgeries each year. 10 patients had distal papilloma and 11 patients had a history of tracheostomy. PSPB was found in 12 patients, HPV-11 was 9 patients and HPV-6 was 6 patients. Chi-square test results showed no significant results with $p = 0.525$.

Conclusion : There was no correlation between PSPB aggression with HPV-6 and 11

Keywords : Aggressive Papilloma Respiratory Channels, HPV types 6 and 11, Chi Square.

Introduction

Recurrent respiratory tract papilloma (PSPB) is divided into child-onset PSPB or juvenile type and adult or adult-onset PSPB^{1,2}. Recurrent respiratory tract pneumonia is a disease caused by HPV in particular types 6 and 11^{3,4}. The manifestation of this viral infection is an esophageal lesion in the respiratory tract and has repetitive growth properties. This disease might undergo remission after obtaining multiple microscopic laryngeal surgeries, but in other conditions, it continues to grow and spread along the respiratory tract making it

more difficult to cure^{5,6}.

There are 76.47% of patients with implantation of the distal papilloma, even 21.57% has expanded to the trachea and bronchi. The tracheotomy was performed in 60.78% and 10% were tracheotomized more than once. A history of microscopic laryngeal surgery three times or more was obtained in 14.58% of patients. The transition sites include the inferior surface of the vocal cord, the vestibule of the rice, the nasopharyngeal mole palate, the trachea, the carina, and the bronchi, as well as the area around the tracheotomy stoma⁷. Virus type examination could predict the prognosis of disease travel⁸.

Corresponding author:

Department of Otorhinolaryngology, Faculty of Medicine-Dr. Soetomo General Hospital, Universitas Airlangga, Surabaya 60285, Indonesia

Alternative therapies began to be considered based on the course of the disease. In-study therapy was included interferon- α , indole-3-carbinol, retinoid, bevacizumab, and cidofovir⁹. Human papillomavirus

(HPV) part of the cellular-mediated immune-response¹⁰, a virus belonging to the Papoviridae group that has no capsule, icosahedral, composed of double chains by 8000 pairs of DNA molecular bases^{11,12}. There were 35 types that infect the genital mucosa, including high-risk types correlated with malignancy and low risk with condyloma or low-grade cervical intraepithelial neoplasia¹². Human papillomavirus is considered an etiologic factor in PSPB with the discovery of an antigen or genome of HPV in papilloma tissue¹³.

Mounts, et al (1982) examined capsid antigen in the surface epithelial nucleus that using immunoperoxidase techniques and the HPV genome in papillary tumor tissue was using hybridization analysis techniques. Papillary viral antigens were found in four of the 20 PSPB specimens, while the HPV genome was found in all specimens¹³. HPV transmission is suspected to be multifactorial, but in children, the most common risk factor is vertical transmission when the delivery from an HPV-infected mother. There was an increased risk of juvenile PSPB up to 200 times in women with genital condylomata accuminata. Transmission of adult type PSPB occurs through oral sexual activity with multiple partners¹⁴. Cesarean section operation is estimated to decrease the incidence of vertical HPV transmission¹⁵.

Recurrent respiratory pneumonia is a problem for the THTKL expert because of the unknown aggressiveness correlation with HPV-6 and 11. This study intends to identify HPV types 6 and 11 in patients with PSPB is expected to be a factor in predicting the aggressiveness of the disease.

Method

An observational cross-sectional analytic was used by observing how HPV-6 and 11 in recurrent respiratory tract could lead to aggressive or non-aggressive disease¹⁶. Aggressive PSPB criteria were diseases that require surgical removal of papilloma three or more times within a year, have undergone a tracheotomy, or have implanted distal laryngeal papilloma on rigid or flexible laryngoscopy examination¹⁷. The non-aggressive PSPB criterion was a disease requiring surgical removal of papilloma less than three times within a year, never undergoing a tracheotomy and no

implantation of the distal laryngeal papilloma on rigid or flexible laryngoscopy¹⁷.

The PSPB patient the Outpatient Otolaryngology Dr. Soetomo General Hospital and undergoing Microscopic Laryngeal Surgery (BLM) at Surgical Installation Center from December 2012 to March 2013. The sample of this study came from the tissue of patients with PSPB who underwent BLM. The inclusion criteria were respiratory papilloma recurrence of all ages, medical records of patients during the complete treatment, and willing to participate the research by signing an informed consent. Patients will be determined by the group aggressive or not aggressive. The tissue of BLM surgery results conducted at Surgical Installation Center of Dr. Soetomo General Hospital was as a research sample. The sample was taken at the Universitas Airlangga Tropical Disease Institute for HPV-6 and 11 examinations using PCR (Polymerase chain reaction) method. The research data was tabulated in the data collection sheet and then processed statistically using the x2 test.

This research requires several tools in the implementation, that were Microscopic microscopic surgical devices include Optomic OP C-12 optical microscopes, Kleinsasser laryngoscope brand Storz 8590C, Aesculap straight or upturn forceps, cotton, lidocaine-ephedrine 8%, and suction set. The operative specimens were stored in a glass bottle filled with 0.9% normal saline liquor. Polymerase chain reaction checking tool is with PCR Thermal Cycler engine from Bioneer, HPV Intron 2x primer reagent PCR master mix. Primary HPV-6 in LCR region along 258-361 base pairs in the 5'-TAG GGG ACG GTC CTC TAT TC-3 'or 5'-GCA ACA GCC TCT GAG TCA CA-3' sequence. While the HPV-11 primer at the L1 region along 356 base pairs with the base sequence of 5'-GAA TAC ATG CGC CAT GTG GA-3 'or 5'-AGC AGA CGT CCG TCC TCG AT-3'.

Results

There were 15 patients that all of them was a child of PSPB type. All patients had complete data during the first diagnosis up to the control so that all were included in the study

Table 1. Distribution of distal laryngeal papilloma and history of tracheotomy of PSPB patients in Dr. Soetomo General Hospital Surabaya in December 2012 to March 2013

	Amount	Percentase
Distal laryngeal lymphoma		
Yes	10	66.67
No	5	33.33
History of tracheotomy		
Yes	11	73.33
No	4	26.67

Distal laryngeal lymphoma was found in 10 patients (66.67%), while 5 patients (33.33%) had a history of papilloma in the distal larynx. Tracheotomy history was found for 11 patients (73.33%), while 4 patients (26.67%) did not have a history of tracheotomy.

Table 2. Distribution of PSPB aggressiveness of PSPB patients in Dr. Soetomo General Hospital Surabaya in December 2012 to March 2013

Aggressiveness	Amount	Percentase
Aggressive	12	80
Non-aggressive	3	20

Aggressive papilloma was obtained from 12 patients (80%), while 3 patients (20%) were classified as non-aggressive PSPB.

Table 3 Distribution of HPV-6 and 11 patients with PSPB in Dr. Soetomo General Hospital Surabaya in December 2012 to March 2013

HPV Type	Amount	Percentase
HPV-6	6	40
HPV-11	9	60

Human papillomavirus type 6 was obtained in 6 patients (40%) and 9 (60%) were infected with HPV-11.

Table 4. Distribution of annual BLM history, distal laryngeal palsy, and history of tracheotomy on HPV-6 and 11 patients with PSPB in Dr. Soetomo General Hospital Surabaya in December 2012 to March 2013

	HPV Types		Total
	6	11	
History of BLM every year			
< 3x	3 (50%)	3 (50%)	6 (100%)
≥ 3x	3 (33.33%)	6 (66.67%)	9 (100%)
Distal laryngeal lymphoma			
Yes	3 (30%)	7 (70%)	10 (100%)
No	3 (60%)	2 (40%)	5 (100%)
History of tracheotomy			
Yes	4 (36.36%)	7 (63.63%)	11 (100%)
No	2 (50%)	2 (50%)	4 (100%)

The history of BLM <3x was obtained in three patients (50%) with HPV-6 and HPV-11. Whereas the history of BLM ≥ 3x was obtained by 3 patients (33.33%) with HPV-6 and 6 samples (66.67%) with HPV-11. The history of distal laryngeal papilloma was obtained in 3 patients (30%) with HPV-6 and 7 patients (70%) with HPV-11. Patients without the history of distal laryngeal

papilloma consisted of 3 patients (60%) with HPV-6 and 2 patients (40%) with HPV-11. The history of tracheotomy was found in 4 patients (36.36%) in HPV-6 and 7 patients (63.64%) in HPV-11. Patients without a history of tracheotomy have the same amount. i.e., 2 patients (50%) in both HPV-6 and HPV-11 (Table 10).

Table 5 Aggressive correlation between PSPB and HPV-6 and 11 patients with PSPB at Dr. Soetomo General Hospital Surabaya in December 2012 to March 2013

	HPV types		Fisher
	6	11	
PSPB aggressivity			
Aggressive	4 (33.33%)	8 (66.67%)	0.525
Non-aggressive	2 (66.67%)	1 (33.33%)	

Aggressive recurrent respiratory febrile respiration consists of 4 patients with HPV-6 (33.33% of all HPV-6 patients) and 8 patients with HPV-11 (66.67% of all HPV-11 sufferers). Recurrent non-aggressive respiratory nasal passages consisted of 2 HPV-6 patients (66.67% of all HPV-6 patients) and 1 patient (33.33% of all HPV-11 sufferers). One-Sample Kolmogorov-Smirnov test results obtained p = 0.002. Fisher test results obtained p = 0.525 (Table 11).

Discussion

Table 1 shows the percentage of papilloma growing at the distal site of the larynx was 66.7% and the tracheotomy history was 73.3%. It shows that most sufferers have aggressive disease. The figure was proportional to Doyle. et al. (1994) that reported 60% had a history of tracheotomy and 55% had distal papilloma¹⁸. Wiatrak et al. (2004) reported 11% had the tracheotomy and 23.3% experienced distal papilloma growth¹⁹. The more aggressive course of the disease was seen from the many incidences of distal papilloma growth and the history of tracheotomy.

Table 2 presents an aggressive disease was 80%. Some of the aggressive PSPB findings was performed by Doyle. et al. (1994) with the amount 58.8% and Buchinsky. et al. (2008) was 81%. The results were in accordance with the above findings. The high findings of the aggressive PSPB were consistent with the high incidence of aggressive factors in the above discussion. All patients were classified as juvenile type PSPB^{17,18}.

Table 3 shows the percentage of HPV-6 infections by 40% and HPV-11 by 60%. No samples with double infection or HPV infection other than types 6 and 11. Wiatrak. et al. (2004) stated that patients with HPV-6 by 53.5%, HPV-11 was 39.7% and 6.9% had both types. Buchinsky. et al. (2008) get the percentage of HPV-6 infection by 60% and HPV-11 by 40%. The results of this study were in accordance with Buchinsky that the incidence of HPV-11 infection was more dominant than HPV-6¹⁷.

Table 4 was the distribution of annual BLM history correlation, distal papilloma and tracheotomy history of HPV-6 and 11. The annual BLM history was grouped into two categories i.e., BLM history of more or equal to 3x (≥ 3x) within one year and BLM history less than 3x within one year period provided that the BLM history ≥ 3x was an aggressive type of PSPB category.

Patients with a history of BLM every year <3x consisted of 3 persons each with HPV-6 and HPV-11 infections, while patients with annual BLM category ≥ 3x consisted of 3 people with HPV-6 and 6 people with HPV-11. Human papillomavirus type 11 causes the patient to experience BLM every year ≥ 3x more often than BLM each year <3x (6 samples vs. 3 samples), while HPV-6 balanced in causing BLM every year ≥ 3x or <3x. Human papillomavirus type 11 tends to cause BLM surgery more frequently.

Papilloma with spread to the distal larynx was one indicator of disease aggressiveness. Seven patients with distal laryngeal palsy are known to be infected with

HPV-11, while a number of 3 patients infected with HPV-6. Patients with no history of distal laryngeal papilloma accompanied by HPV-6 were 3 patients and 2 patients with HPV-11. Wiatrak. et al. (2004) stated that 12 samples for papilloma in the trachea with HPV-11 infection and 11 patients with HPV-6. Patients without a history of papilloma in the trachea consisted of 28 patients with HPV-6 and 11 patients with HPV-11¹⁹. This study was in accordance with the literature that HPV-11 tends to cause patients to have distal laryngeal palsy compared with HPV-6.

Seven patients with a history of tracheotomy had the HPV-11 infection and 4 HPV-6 infected persons, while patients without tracheotomy obtained 2 patients with HPV-6 infection and HPV-11. Wiatrak. et al. (2004) stated that 21.7% of patients with a history of tracheotomy having HPV-11 of 5 samples and 1 sample with HPV-6. Patients without a history of tracheotomy consisted of 30 samples with HPV-6 and 18 samples with HPV-11¹⁹. The results were similar to the literature findings because the trends in HPV-11 cause the patient to require tracheotomy compared with HPV-6.

Table 5 shows the correlation between aggressiveness and HPV types 6 and 11. The assessment aspect of the correlation was whether there was an association between aggressive PSPB and HPV-11 versus non-aggressive PSPB with HPV-6. Aggressive respiratory febrile respiratory infections were 8 HPV-11 infected and 4 with HPV-6, while the non-aggressive PSPB consisted of 2 HPV-6 and 1 patients with HPV-6.

The results of the One-Sample Kolmogorov-Smirnov test was $p = 0.002$ which mean the data has abnormal distribution because of the value of $p < 0.05$. Fisher test got result $p = 0.525$ meaning that there was no correlation between aggressiveness PSPB and HPV types 6 and 11 because of $p > 0.05$.

Buchinsky. et al. (2008) obtained 43 aggressive PSPB samples with HPV-11 infection and 52 patients with HPV-6, while PSPB was not aggressive with HPV-6 infection of 19 patients and 4 patients with HPV-11. These results indicate that HPV-11 tends to cause more aggressive disease than HPV-6 and the correlation was statistically significant with $p = 0.02$ ($p < 0.05$).

Conclusion

There was no correlation between recurrent respiratory tract aggressiveness with HPV-6 and 11.

More aggressive recurrent respiratory papillomas more infected with HPV-11 and HPV-6 than recurrent non-aggressive respiratory tract papillomas.

Ethical Clearance: The present study was carried out in accordance with the research principles. This study implemented the basic principle ethics of respect, beneficence, nonmaleficence, and justice.

Conflict of Interest: None declared

Abstract

Renal failure (RF) is common disease, it is decrease of kidney function, glomerular filtration rate (GFR) this use to estimate the kidney function reduction usually is less than 60 mL / min, depending on global Burden of Disease, and the disease is ninth cause of death in the world, According to the global Burden of Disease. Our study is investigated in the relationship between IL-17F (rs763780) genes polymorphic variants in renal failure patients in Iraq. This study was accompanied around Iraqi renal failure patients, the period from February to November 2018. This study included 70 patients from Abn-Sina Center for dialysis and kidney disease, and 30 healthy controls. Tetra-primer ARMS-PCR is rapid, effective and developed assay used our study for studying in genotyping polymorphism of IL-17F (rs763780) genes. Result of our report including the correlation between the genotypes of IL-17F (rs763780) and the incidence of renal failure, as the results show a non-marked difference between patients and controls when genotype T/T (OR = 0.75). Also, no significant difference between patients and control when genotype C/C (OR = 0.85), while the genotype T/C (OR = 2.23) show important difference between control and patients more than two times. In conclusion, IL-17F play an essential role as pro-inflammatory cytokine in renal failure patients and development disease.

Keyword: - renal failure patients, rs763780 , ARMS-PCR and IL-17F gene.

Introduction

Kidney is important organ, its function is regulation of the blood composition and volume, filtration the urine by eliminating the metabolic wastes, secretion of the end metabolism products and maintenance the acid or balance in the body via regulate fluids and electrolytes (1). Renal failure (RF) is common disease , usually is defined as the decrease of kidney function, glomerular filtration rate (GFR) this use to estimate the kidney function reduction usually is less than 60 mL / min (2) .

Interleukins -17F (IL-17F) types of cytokine produced from Th 17 cells. act on Stimulate inflammation and causing organ injury , also act on enhancing produce of pro-inflammatory cytokines by resident cells , that lead to increase penetration of neutrophils to affected organ and induce inflammation and damage in this organ such as kidney (3,4) . All these interleukins are similar in structure protein, but have in the N termini large sequence divergence.

Both IL-17A and IL-17F genes are located on chromosome 6p12.3-q13, and each consists of three exons and two intron the transcribed occurs in opposite direction, cytokine genes resulting together during gene replication also use same regulatory elements. In human, about of 50 % sequence identity between IL17A and IL17F, both of these types produce homodimer and heterodimer proteins (5). Cytokine production may be effected by cytokine gene Polymorphisms through effect this gene on transcription. Single nucleotide polymorphisms (SNPs), acts on induce susceptibility or resistance to any infection, also may be used to diagnose some factors that contribute to cancers or inflammatory disease because SNP occurs in regulatory regions for cytokine gene (6). Tetra-primer amplification refractory mutation system PCR (T-ARMS-PCR), these methods is very important to detect (SNP) genotyping because have several features rapid, ease to perform, an inexpensive, and accurate method (7).

This method is ARMS-PCR modification; four primers are used. Two inner primers were allele specific and lead to produce two bands are different in size (lower molecular weight), this band appears depend on wild or mutant allele is present. And two external or outer primers produce non-allelic was control band. And the location of mismatch is middle for the specific allele primers and use four primers in these methods (8). While in ARMS-PCR the location of mismatch in 3' end for the specific allele primers and utilize five primers. T-ARMS-PCR assay represent successfully methods to detect SNPs and others genetic or biological markers that associated with different disease such as effect TNF- α gene polymorphism in chronic pancreatitis patients (9).

Aim of our study is to determining the association and relationship between IL-17A (rs2275913) genes and Iraqi renal failure patients .

Material and Method

This study was accompanied around Iraqi renal failure patients, the period from February to November 2018. This study included 70 patients from Abn-Sina Center for dialysis and kidney disease and 30 healthy controls.

1-Collection of samples:-

Study groups Samples were Collected 2 ml from whole blood in EDTE tube until extraction human genome. And use to investigate about IL-17F (rs763780) genes in study groups.

2-Genomic DNA Extraction:

The DNA was extracted by use special kit (Geneaid, Korea) according to the company directions.

3-T-ARMS-PCR and Primer Design:

Batchprimer3 program was used for designing, several types of primers are used included generic primers (including SSR primers with SSR detection) and SNP genotyping primers (including allele-specific primers, single-base extension primers, and tetra-primers for tetra-primer ARMS PCR), furthermore, DNA sequencing primers ⁽¹⁰⁾. Show table 1. T-ARMS-PCR Analysis occurs by using Accupower PCR Premix (Bioneer, Korea) whole volume of 20 μ L included DNA (4 μ L), outer primers (1 μ L), inner primer (1 μ L) and add D.W (12 μ L). PCR process is start at (95) $^{\circ}$ C for five minutes, then the second step is start at (95) $^{\circ}$ C for twenty second, then annealing is start for twenty sec , annealing was carried out at 72 $^{\circ}$ C for twenty seconds and finally the process is finished at (72) $^{\circ}$ C for three minute. Then electrophoresis are used for emigration of all PCR products after stained it by ethidium bromide.

Statistical Analysis

Our study used SAS program for statistical Analysis for differentiates between in parameters wherever LSD test was trying to compassion between groups ⁽¹¹⁾. Whereas odds ratios (OR) and 95% confidence intervals (95% CI) were calculated using MedCalc for Windows, version 18.10 ⁽¹²⁾.

Table 1 the used primers used in ARMS-PCR technique

SNP	System	Primer	Allele	Tm	Amplicon
rs763780 IL17F	Forward inner primer	GAGTGGATATGCACCTCTTACTGCAAAC	C	62	158
	Reverse inner primer	CGTCACCCCTGTCCATCCAACA	T	62	106
	Forward outer primer	AGACAGGACTTGTTCAGAGCACTG		62	215
	Reverse outer primer	ATGAATTCCGTTCCCATCCAGC		62	

*Tm Temperature of melting

Result

The renal failure patients group consisted of 70 patients, 40 males (57%) and 30 females (43%), with a mean age of 49.5 ± 5.91 years. The healthy control group consisted of 30 subjects, with a mean age of 30.3 ± 3.62 years.

In IL-17F (rs763780), the fragment lengths for the specific amplicons were as follows; 158 bp for the C allele and 106 bp for the T allele. The presence of two specific amplicons for an SNP indicates heterozygosity. In addition, non-indicative amplicons resulting from the common primer pairs are always present (215 bp for the two outer primers) show figure 1.

The IL-17F (rs763780) TC, CC and TT genotypes figure (1) were detected in 5 (7%), 4 (6%) and 61 (87%) patients, and in 1 (3%), 2(7%) and 27 (90%) controls, respectively. Frequency of genotype TC, CC and TT significantly increase in the groups of patients compared

with control.

The genotype TT recorded highly ratio in both groups patients and control (57-90%) which made it the common genotype for this locus in Iraqi population. both homozygous genotype showed preventive fraction according odds ratio (0.85, 0.75), while TC genotype according odds ratio consider as etiological fraction. The analysis of the allele impact, including both genotypes that containing C allele showed no significant association in patient group comparing with control ($p=0.829$). According OR, allele C tend to be risky allele, while allele T tend to be a preventive allele (Table 2).

According to the sex the results in Table (3) the genotype TT showed as preventive fraction according odds ratio (0.34), while TC and CC genotype according odds ratio consider as etiological fraction (3.22, 2.35) respectively. Also according OR, allele C tend to be risky allele, while allele T tend to be a preventive allele.

Figure (1): electrophoresis of samples on agarose gel by using T-ARMS-PCR assay: The IL-17F (rs763780) locus genotyping by T-ARMS-PCR resolved on a 2% agarose gel stained with ethidium bromide (45 min, 150V/cm, 1X Tris-acetic buffer). 215 bp, the bands are amplicon, and T and C allele-specific bands are 106 bp and 158bp amplicons respectively (Bioneer, Korea).

Table (2) Distribution of genotypes for the IL-17F (RS763780) gene samples of patients and healthy controls.

SNP	Genotype	Patients* n=70 n (%)	Control n=30 N (%)	OR(95%CI)	P.value
Rs763780 IL17F	T/C*	5 (7%)	1 (3%)	(0.26-19.30) 2.23	0.415
	C/C	4(6%)	2 (7%)	(0.15-4.79) 0.85	0.585
	T/T	61(87%)	27 (90%)	(0.19-2.94) 0.75	0.488
	Allele frequencies				
	T	127(91%)	55(92%)	0.88(0.301-2.61)	0.829
	C	13(9%)	5(8%)	1.12(0.39-3.31)	0.829

*only present significant in TC genotype between two groups.

Table (3): prevalence of IL-17F (Rs763780) gene in patient samples according to sex.

SNP	Genotype	Male* n=40 n(%)	Female n=30 N (%)	OR(95%CI)	P.value
Rs763780 IL17F	T/C*	4(10%)	1(3.3%)	(0.35-29.36) 3.22	0.281
	C/C*	3 (7.5%)	1(3.3%)	(0.24-22.95) 2.35	0.423
	T/T	33 (82.5%)	28 (93.4%)	(0.07-1.71) 0.34	0.164
	Allele frequencies				
	T	70 (87.5%)	57(95%)	0.36(0.1-1.4)	0.143
	C	10 (12.5%)	3(5%)	2.71 (0.71 – 10.33)	0.143

*only present significant in TC and CC genotype between two genders.

Discussion

Recently , some studies were improving CD4+ differentiation to Th1 ,Th2 and Th17. Th17 able to producing IL-17 family such as IL-17A and IL-17F and these are playing essential role in autoimmune disorders by stimulation (acute and chronic) inflammation such as renal disorders. Also macrophages, mast cells and neutrophils are able to produce IL17A ⁽¹³⁾.

Renal failure occurs in male more than female and the mean age is 49.5 ± 5.91 years respectively , this result agree with ⁽¹⁴⁾ this study group consisted of 53 Renal failure patients and present 28 males and 25females , with a mean of age 51.0 ± 13.6 years. Also agree with ⁽¹⁵⁾ in this study included 100 sample: males sample was 61 (61%) and females was 39 (39%), and age range about (44.7 ± 22.1) year).

Polymorphisms located for IL-17A and IL-17F within genes coding play a role as genetic factors, and that lead to associate with occurring disease.

In IL17F polymorphisms the genotype T/C (OR = 2.23) show a significant difference between patients and control more than two times. This result similarity with ⁽¹⁶⁾ this study show IL-17F frequencies allele A were significantly higher in immune thrombocytopenia for patients and controls : 31.85% and 18.98% respectively . Specifically, patients have higher frequencies in AA and AG genotypes compared with controls [AA: 17.12% vs. 9.49% and AG: 29.46% vs. 18.98%].

This result is leading to role of AA and AG genotypes for IL-17F as risk factors in renal failure disease. IL-17F polymorphism have association with several disease include : IBD ⁽¹⁷⁾, Development of asthma ⁽¹⁸⁾ , autoimmune thyroid diseases ⁽¹⁹⁾ , acute myeloid leukaemia ⁽²⁰⁾ and recently in MS ⁽²¹⁾.

Another study is improves the polymorphisms in IL-17A and IL-17F genes play a significant role in Rheumatoid Arthritis ⁽²²⁾. In Southern Brazil, ⁽²³⁾ were show the relationship between IL17A rs2275913 polymorphisms and chronic periodontitis, while IL17F polymorphism was not associated with same disease. IL-17A and IL-17F play main role in development of inflammation and others act on host defense against infection by prompting gene expression that encoding for several pro-inflammatory cytokines, chemokine and antimicrobial ^(24, 25) . IL-17F and IL-17A have same sequence in amino acid ant both have same function. The cytokine have able for activation of neutrophil ⁽²⁶⁾ .

Conclusion

IL-17F play an essential role as pro-inflammatory cytokine in renal failure patients and development disease. And renal failure disease associated with heterozygote allele.

A Descriptive Study to Assess the Problem Faced by the Adolescents of Alcoholic Parent

Saranbharati.B¹, Ramya.V¹, Rajalakshmi¹, Devaki. K²

¹B.Sc (NURSING) Student, Chettinad College of Nursing, M.Sc (Nursing), M.sc (Psychology), Nursing Tutor, Chettinad College of Nursing, Chettinad Academy of Research and Education, Tamilnadu

Abstract

A descriptive study to assess problems faced by the adolescents of alcoholic parent in selected community area, Kancheepuram district, Tamil Nadu. Objectives of the study to assess the problems faced by the adolescents of alcoholic parents and to find out association between the problems faced by the adolescents of alcoholic parent with their selected demographic variables. Non experimental approach and descriptive design used for this study. Samples were selected by using purposive sampling technique. The sample consisted of 50 adolescents. Self-structured questionnaires for assessment of demographic variables and used to assess the problem faced by adolescents of alcoholic parents. The data collected from 50 adolescents (Girls and boys) in the age group between 15 to 18 years. Study show that 9(18%) severe problems, 31(62%) moderate problems and 10(20%) mild problems. Study shows that there was significant association between the levels of problem faced by the adolescents of alcoholic parent with age and occupation of alcoholic parent (p value = < 0.05).

Key words: assess, problems, alcoholic parent, adolescents.

Introduction

Alcoholism today clearly seen as a family disease ravaging not just the individual who drinks excessively but also the entire family. The primary victim is the individual who drinks excessively, no doubt, but the family members are also affected with just the same intensity, if not more. Families complicated by alcoholism can be considered as families in a never ending series of crisis. Alcoholism disrupts even normal routine family tasks and function, increase conflicts and demands adaptive responses from family members who simply do not know 'how' to respond appropriately. The social stigma associated with alcoholism, the economic drain on the family's resources, the threat to physical well-being job insecurity all compound to the problem^[4]

An estimated 6.6 million children under the age of 18yrs live in household with at least one alcoholic parent. Current research findings suggest that these children are at a risk for a range of cognitive, emotional and behavioural problems.^[1] Between 15 and 20 per cent of Indian people consume alcohol and, over the past twenty years, the number of drinkers has increased from one in 300 to one in 20. In globally today in there

are an estimated 28 million children who have alcoholic parents. The adolescents world wide 10 to 24 years is 356 million,^[3] Tamil Nadu 1.24 crore, India 253 million. According to 2012 in India report approximately 1.28 Million Parents have a alcohol addiction problem. 11 million of those children under the age of 18. In 2012 about 3.3 million death or 5.9% of all global death due to alcohol consumption.^[3]

Method

Adolescents (Girls and Boys) who were in the selected community area (pooncheri & payanoor) in the age group between 15 to 18 years residing in a selected community area, Kanchipuram district, Tamil Nadu,, 50 samples were chosen for the present study.

Design

In this study non experimental research approach and Descriptive research design adopted, Purposive sampling technique adopted. Self-structured questionnaires consist of 20 questions used and self -structured questionnaires to assess demographic variables. Each sample will take 30 minute to completion of the data.

Instrument/material

Self-structured questionnaires consist of 20 questions used and self -structured questionnaires to assess demographic variables. Each sample will take 30 minute to completion of the data. There are Two Section (A&B) Section A consist of self-Structured Questionnaires to assess demographic variable & Section B Self-Structured Questionnaires to assess the problem faced by the adolescents of alcoholic parent consist of 20 questions.

SCORING INTERPRETATION	
SCORING	INTERPRETATION
27-40	Severe
26-14	Moderate
13-1	Mild

Procedure

The written informed consent was obtained from the parent and guardian as well as from the study participants. Permission letter was obtained from the HOD of Mental Health Nursing department, HOD of Community Health Nursing department, Community area, UG Committee and Human Ethical Committee.

Statistical Analysis

Descriptive statistics like frequency distribution, percentage, mean, standard deviation and inferential statistics like chi square was used to analyse the data.

Result:

The study finding revealed that,

❖ Our study results shows that assessing the levels of problems faced by the adolescent of alcoholic parent 31(62%) moderate problems, 10(20%) mild problem and 9(18%) severe problem.

S.no	Problems Level	Frequency	Peren-Tage
1.	Mild problems	10	20%
2.	Moderate problems	31	62%
3.	Severe problems	9	18%

(N=50)

Discussion

The study was conducted to assess H1 there is a significant association between the levels of problems faced by the adolescents of alcoholic parent with selected demographic variable and to assess H₂ There is significant association between the problems faced by the alcoholic parent and selected Demographic data. The hypothesis H₁ and H₂ was accepted suggestion that there will be significant association between the level of problems faced by the adolescents of alcoholic parent and the selected demographic characteristics of adolescents. The finding revealed that the problems has statistically significant with age of adolescent and occupation of alcoholic parent p value < 0.05 level and other variables are not significant. The limitation of the study was the data collection period was limited for one week. Large number of sample could not be obtained due to difficulty found the samples in the age group of 15 to 18 years of adolescent of alcoholic parent for data collection. Based on the findings of the study, following recommendation are put forth the study can be done on a large sample thereby findings can be generalized. a similar study can be conducted using teaching strategies like structured teaching programme, video assisted teaching. The nurse researcher will help us to know the adolescents with severe problems and give them awareness and psychological support and helpline numbers to prevent or to reduce the problem. On the basis of conducted research it can be concluded the assessment of problem faced adolescent by the adolescent of alcoholic parent has a important determination of early prevention from complication. Problems faced by adolescent of alcoholic parent and associated factor in previous study shows that the study to assess the problem faced by the adolescents of alcoholic father. The study is consisted of 60 adolescents . Study finding data shows that most (61.66%) of the children were females and 38.3% were males. The data presented was shows no association between physical health status and selected demographic variables like sex, age, duration of father's alcoholism, treatment received for alcoholism except to income of family per months at significance of 0.05 level. **Deepa shaji Thomas et al (2012).**

Demographic, Clinical and Hormonal Characteristics as Predicting Factors Affecting the Outcome of Laparoscopic Ovarian Drilling in Women with Poly Cystic Ovary Syndrome

Shelan Omar Jaafar¹, Ghada Saadulla Alsakkal², Namir Ghanim Al-Tawil³

¹Assistant Lecturer, PhD Student, ²Assistant Professor, Department of Obstetrics and Gynecology, College of Medicine, Hawler Medical University, Erbil, Iraq, ³Full Professor, Department of community medicine, College of Medicine, Hawler Medical University, Erbil, Iraq

Abstract

Background: Laparoscopic ovarian drilling as a second line of treatment modality for those PCOS patients failed to respond to clomiphene citrate they may have the benefit of avoiding the side effects of long term drug therapy, lower costs and less time for successful ovulation and conception compared to medical treatment.

Objectives: Before doing LOD recognize factors that affect the outcome of the procedure for selecting patients to avoid unnecessary or unbeneficial intervention. **Method:** 143 anovulatory infertile PCOS patients followed up for 6 months after LOD for ovulation with pre-operative assessment for demographic characters and serum hormone levels (LH, FSH, free testosterone, AMH and prolactin). **Results:** Ovulation was demonstrated in 59.4%. Regression analysis showed significantly higher rates of ovulation among women < 5 years duration of infertility (OR = 3.35, 95% CI = 1.47-7.65), LH > 12 mIU/ml (OR = 4.18, 95% CI = 1.28-13.63) and free testosterone < 4.5 ng/ml (OR = 3.22, 95% CI = 1.08-9.59). No significant (p = 0.078) association was detected between the ovulation rate and the AMH level, but it is evident that the OR was around 2 among women with AMH level of less than 7.7 ng/ml.

Conclusion: preoperative LH, free testosterone and duration of infertility regarded as 3 important predicting factor for success of LOD

Keywords: PCOS: polycystic ovary syndrome; LOD: laparoscopic ovarian drilling, Ovulation.

Introduction

Polycystic ovary syndrome (PCOS) is one of the most prevalent endocrinopathies affecting about 5-10 % women of reproductive age group. There is a great controversies regarding the diagnosis and mode of treatment of this syndrome¹, although experts have been succeeded to develop a universally accepted criteria for diagnosis of PCOS² but adoption of optimal treatment had not yet reached. Wedge resection of ovary which is first described by Stein and Leventhal³ for treating anovulation by laparotomy has been developed to less traumatic ovarian surgery through the laparoscope by Gjonnaess⁴. LOD is currently recommended as an

alternative second line approach, safe and cost effective to gonadotropins for those with anovulatory infertility, without the risk of multiple pregnancy and ovarian hyperstimulation⁵, still there is no well-established mechanism of action of LOD and therefore we can not exactly answer the question why some PCOS patients not responding to this treatment⁶, and it is not known whether it will exerts it is effect directly on the ovary or through systemic endocrine pathway⁷, it may act by destroying ovarian androgen-producing tissue and reducing the peripheral conversion of androgens to estrogens. However, others believe that ovarian diathermy works by increasing the sensitivity of the ovaries to endogenous FSH, and that only a minimal amount of thermal injury is required⁸. A fall in the serum levels of androgens and LH and an increase in FSH levels have been demonstrated after ovarian drilling⁹,

Corresponding Author:

The aim of the present study was to identify some of the factors that affect the outcome of LOD for improvement of success in women with PCOS for better selection of the patients that get benefit from this intervention and avoidance of unbeneficial surgery.

Materials and Method

The current study followed 143 subfertile women with anovulation failed to respond to oral medical therapy (persistent anovulation despite maximum dose of oral therapy for up to 6 cycles) consulting the outpatient gynaecology and fertility clinic in Maternity Teaching Hospital, public maternity hospital in Erbil, Iraq from September 2016 to July 2018. All included patients in the study diagnosed to have PCOS based on Rotterdam criteria include at least two of the three criteria: oligo-anovulation, clinical and/or biochemical evidence of hyperandrogenism, and sonographic features of polycystic ovaries². Written informed consent was obtained from each participant after explaining the study purpose, procedures and follow up time. Those associated with tubal and male factors infertility, endocrine disorders (thyroid disease, Cushing's syndrome and androgen secreting tumor) AMH < 4ng/ml and FSH >12.5mIU/ml are all excluded from the study. All enrolled women underwent transvaginal ultrasound preoperatively.

Preoperatively baseline hormones were measured at the day 2-4 of cycle for serum levels of LH, FSH, testosterone, SHBG, AMH and prolactin, the LH:FSH ratio and FAI calculated. Serum hormone levels were measured by Elecsys machine (Roche Diagnostics, Hitachi, Switzerland) for determination of human LH, FSH, testosterone, prolactin and SHBG levels. AMH was measured by Enzyme linked immunosorbent assay (ELISA) kit.

After cycle in the proliferative phase (progesterone induced withdrawal bleed or spontaneous) LOD performed by or in the presence of first author to ensure that the same technique was used for each patient by a laparoscope (Karl Storz, Germany) with assessment of tubal patency with methylene blue and macroscopically uterus, tubes and ovaries were examined. The technique described by⁹ four punctures performed per ovary, each for 4 s to a depth of 4-6 mm, a monopolar coagulating electrical current at 40 W power setting used, at the end of the procedure pelvis was irrigated with lactated Ringer's solution and 500 cc was left intraperitoneally. Ovulation

and pregnancy followed up to 6 months (ovulation defined as the presence of at least one mature graffian follicle measuring ≥ 18 mm by transvaginal ultrasound and serum progesterone level at the day of 21 as indicators of ovulation (serum progesterone level ≥ 13 nmol/l was considered a strong indication for ovulation¹⁰).

Statistical analysis

Data were analyzed using the Statistical Package for Social Sciences (SPSS, version 22). Student's t test of two independent samples was used to compare means of two groups. Chi square test of association was used to compare between proportions. When the expected count of more than 20% of the cells of the table was <5, Fisher's exact test was used. Logistic regression analysis was used where the dependent variable was binary categorical (ovulation whether yes or no). Variables found (by univariate analysis) to be significantly associated with the dependent variable were entered into the regression model as independent variables (covariates). A 'p' value of ≤ 0.05 was considered as statistically significant.

Results

The study included 143 infertile women with polycystic ovary syndrome. Their mean age \pm SD was 29.52 ± 4.58 years, ranging from 20 to 39 years. The median was 29 years. Table 1 shows that around half (45%) of the students aged 25-29 years, and the duration of infertility of 64.3% of them was ≥ 5 years. The type of infertility of the majority of the women (76.2%) was primary. Regarding the menstrual pattern, it was irregular in the majority (88.8%) of the women. It is evident that only 9.8% of the women were of normal weight, 30.1% were over-weight, and 60.1% were obese.

Table 2 shows that the rate of ovulation was significantly high among women with less than five years of infertility (76.5%) compared with 50% among women with ≥ 5 years of infertility ($p = 0.002$). No significant association was detected between ovulation with age ($p = 0.165$), type of infertility ($p = 0.264$), menstrual pattern ($p = 0.421$), BMI ($p = 0.138$), hirsute ($p = 0.377$), and acne ($p = 0.688$).

The rate of infertility was significantly high (79.2%) among women with LH level of more than 12mIU/ml compared with 55.5% among women with LH level of ≤ 12 mIU/ml ($p = 0.031$). The rate of ovulation was also high (63.4%) among women with free testosterone level of less than 4.5ng/ml compared with 35% among

women with free testosterone of ≥ 4.5 ng/ml. Ovulation occurred in 66.7% of women with AMH level of less than 7.7ng/ml compared with 50% among women with AMH level of ≥ 7.7 ng/ml ($p = 0.044$). No significant association was detected between the rate of ovulation with FAI ($p = 0.096$) and LH FSH ratio ($p = 0.166$).

Table 4 shows no significant differences between the means of hormones (SHBG, prolactin, and FSH) of women who have ovulated and the means of hormones of women who didn't ovulate ($p = 0.173$, $p = 0.598$, $p = 0.0058$ respectively).

Regression analysis (Table 5) showed significantly higher rates of ovulation among women with less than five years duration of infertility (OR = 3.35, 95% CI = 1.47-7.65), high LH of more than 12mIU/ml (OR = 4.18, 95% CI = 1.28-13.63), low free testosterone of less than 4.5ng/ml (OR = 3.22, 95% CI = 1.08-9.59). No significant ($p = 0.078$) association was detected between the ovulation rate and the AMH level, but it is evident that the OR was around 2 among women with AMH level of less than 7.7ng/ml.

Table 1. Basic characteristics of the studied sample.		
Age (years)	No.	(%)
20-24	19	(13.3)
25-29	65	(45.5)
30-34	33	(23.1)
35-39	26	(18.2)

Discussion

Ovulation rate reported in our study was 59.4% and pregnancy rate 32.9% many studies recorded higher rates in their results^{4,9,11}. For prediction of response we focused on ovulation being the primary outcome after treatment.

In the current study, there was no association between the age group, type of infertility, menstrual pattern, presence or absence of hirsute or acne and rates of ovulation after drilling, the same results recorded by other studies^{6,12} while in another study age < 30 years considered as a significant predictor for success¹³ this difference may be due to that their studied population more in younger age. BMI exhibited a great variation regarding it is effect on the success of LOD, some authors found that lean women respond more than obese^{13,14}, on the contrary an author correlated high BMI with the success¹², although in our results and previous studies reported that BMI had no influence on overall ovulation rate^{11,15}. Shorter duration of infertility < 5 years appear to be the best determinant in the present study and before^{6,13,16}, this is not in agreement with the a study of¹² found no association, this can be explained

that longer duration of subfertility may be associated with other causative factors and chronic anovulation needs more time for cure.

It was also noted that preoperative serum LH level were significantly higher among those who achieved ovulation after surgery with a “cut-off” of 12mIU/ml, this is in agreement with several other studies^{11,15} using the same value and same results, Logistic regression in the study of^{6,16} using 10 IU/L “cut-off” value also recognized high LH as a predicting factor for success.

Many researches considered AMH as a predicting factor for diagnosis and response to LOD, High AMH associated with poor response may be due to severity of the PCOS condition in these women. Although association of AMH and ovulation revealed significant ($p = 0.044$) in our data, but by regression analysis AMH is not regarded as a predicting factor. In contrary another author⁷ reported that AMH affect the outcome after LOD using the same “cut-off” value (7.7ng/ml), a possible explanation is that number of the holes by electrocautery and degree of tissue destruction may affect the success.

Favorable outcome was recorded in those with low free testosterone level <4.5 ng/m, this result was consistent with ⁶. Although this is in disagreement with earlier results ^{15,16} can be explained by smaller sample size in their study or inadequate destruction of androgen producing ovarian tissue, so an adjusted thermal dose based on ovarian volume ¹⁷ to be fully elucidated.

On the other hand LH/FSH ratio, FSH, SHBG, FAI and prolactin have no impact on the outcome after LOD, AL-Ojaimi¹² also recorded no significant association with FSH and prolactin level while LH:FSH ratio showed significant while Dubela et al¹⁴ found that high SHBG is significant for success. Inability to follow-up patients for longer periods to record pregnancy and live-birth rates was the main limitation of our study.

Conclusions

Identifying factors that affect outcome of LOD helps in increasing success rate, it is an important issue not only to improve outcome but also to avoid unnecessary surgery and its complications. Higher rate of ovulation found among those with less than 5 years duration of infertility, LH > 12mIU/ml and free testosterone < 4.5ng/ml.

Abstract

Background: Phenomenon of IPA in long-term effect is dominated by negative effect that has risk in undergoing stress. Stress perception will activate the change of physiology system in the body in form of stress response through activating *Hypothalamic-Pituitary Adrenocortical* (HPA) that will increase cortisol production. **Purpose:** investigate how the correlation between stress perception and stress response against IPA for adolescents based on psychoneuroimmunology (PNI) concept. **Method:** This research used cross-sectional design. There were 39 Senior High School students, who were indicated to undergo internet psychological addiction and they were as the sample of this research. **Result:** There were 39 students in six Senior High Schools in Makassar, Indonesia, who were identified to undergo IPA. Stress perception in most of adolescents who underwent IPA was high (61.5%), particularly for adolescent who underwent high internet addiction, and so as the stress response on IPA, which was also high (53.8%), which described health quality for IPA. **Conclusion:** there was a significant correlation between stress perception and stress response on adolescent who underwent IPA based on psychoneuroimmunology approach.

Keywords: internet psychological addiction, adolescents, psychoneuroimmunology, stress perception, stress response

Introduction

Psychoneuroimmunology is an integrated concept regarding function of immune regulation for defending homeostasis. PNI concept views on the correlation among stress, immune system, and health. Stress is consisted of stress-perception and stress response¹. Stressor is a cause for stress-perception and stress response². Ader in Putra³ showed that regulation of immune system or immunoregulation, which firstly was believed as autonomous process, was proven to be influenced by nervous system performance through learning proses that was occurred in central nervous system. Thus, it was proven unautonomous³.

Limitation of PNI according to Ader-Cohen in Putra³, related with behaviour-neuroendocrine-immune system. Definition of stress that was stated was closer with Selye in Putra³ and it was as non-specific response of the body to any demand with biological concept. However,

definition of stress in PNI also used Eric Linderman-Gerald Caplan concept as psychological state involving cognition and emotion, which gave limitation of stress concept in psychological side, whether, psychic stress was defined as cognition that was learning process result or stress perception which could be observed based on modulation of immune response (stress response)³.

The criteria of IPA are: excessive using internet (>6 months); making internet as a dominant activity (salience); undergoing internal and external conflict; appearing euphoria while being able to access internet (mood modification); increasing needs to access internet (tolerance), uncomfortable feeling when the use of internet was limited (withdrawal)⁴⁻⁷.

Phenomenon of IPA on adolescents has become global epidemic. Research result regarding IPA in long-term effect is dominated by negative effects which have risk to undergo depression, anxiety, aggressive behavior,

social isolation, psychiatric symptoms, interpersonal problems and stress⁸⁻¹⁰. Even, negative effect of IPA is as dangerous as alcohol and narcotics addiction^{11,12}

Phenomenon of internet addiction will influence other activities and this will impact to adolescent's physical, cognitive, socio-emotional, and spiritual development disorders that contribute to personal distress (dangerous and destructive stress)^{13,14}

According to conducted observation, it was found low productivity on adolescent who underwent IPA in Makassar. Interview result with students in several Senior High Schools and IPTEK-KOM research¹⁵ showed that they used internet excessively and they made the internet as dominant activity in daily life (Salience) until their time was wasting more only for accessing internet which was not for learning process.

Nevertheless, if the internet was used for searching information for completing homeworks or school tasks, the advantages of internet itself could raise enthusiasm for learning process (eustress), but if it was used excessively, it could cause distress. In other words, internet could cause the students did not want to learn anymore because they could not concentrate well, they were easy to forget (low memory), difficult to understand, and as the impact, they could have poor score at school, and also could have poor sleep quality. This would impact to their learning achievements at school, which caused high academic stress¹⁶.

Internet could not be separated from adolescent's life. Almost all their needs could be fulfilled by internet¹⁷. There were pleasant experiences while accessing internet (mood modification) that was triggered by dopamine spending which caused them would repeat the experience until their time intensity that was needed to access the internet added (tolerance). Although the time intensity to access the internet was controlled, they would try to repeat it with longer intensity (relapse) because they had felt pleasant experience before. However, when they was hindered to access internet, they would feel unpleasant such as annoying, angry, and restless (withdrawal). When the internet had dominated life activity, it would cause imbalance among biological, psychological, and social needs, thus, it would cause conflict either internal or external conflict, even, it could cause aggressiveness to the adolescents¹⁸.

Adolescent's characteristic which was in identity crisis stage, tended to have high curiosity^{19,20} and this

was really supported by socio-cultural condition in urban area that facilitated ease to access internet in several public facilities. Besides, it was also supported by booming smartphone market. Even, rapid information and telecommunication systems development also had the potency to facilitate the occurrence of IPA.

In addition, referring to psychoneuroimmunology paradigm, the stressor (impact of internet addiction on physical, cognitive, socioemotional and spiritual development aspects) would be responded by brain cognitively in stress perception (how coping or adolescent's self-adjustment cognitively and behavior in facing the impact of internet addiction). As we know that, stress perception is an ability to understand or conceptualize accepted stressor that results a cognition (understanding) which can cause stress response in modulation of immune response³. A condition that is stated as stressor by the brain will cause a stress and the change of physiological, psychological, and behavioral aspects.

Lazarus & Cohen assumed that stress involved transaction between the individual and other worlds from him/herself²¹. Primary appraisal is individual first assessment against the occurrences either in positive side, negative side, or netral side which can cause stress (such as incomplete homework due to they are too busy to access internet, school task is assumed as difficult thing that can cause stress). Secondary appraisal is an assessment against resources or self-ability in confronting an occurrence or intimidation. The adolescents will respond stress in different way, they will search information directly, they will not do nothing or will use their owned coping style as their defense efforts.

Perception process is consisted of selection, organization, and stimulus interpretations which are accepted by human sense until they become meaningful things²². Every individual will perceive a stress differently. If it is valued as negative thing by repeating the behavior without trying to correct it well, it will cause a problem for them.

Then, stress perception will activate the change of physiological systems in stress response through activating HPA that can increase production of cortisol. Hence, it impacts to development of health problem. In long-term effect, cortisol can cause the decrease of immune function and nerve damage in hippocampus. This change will increase infection, psychiatric problem,

and loss of concentration and memory²³.

This reseach was conducted in order to investigate how the correlation between stress perception and stress response against IPA on adolescent based on psychoneuroimmunology concept.

Method

This research utilized cross-sectional design. Locations of sample collection in this research were in six Senior High Schools in Makassar from August 2018 until February 2019. The population was all of twelfth grade students in Senior High School who were detected to undergo internet psychological addiction and there were 244 students. The sample size was 39, selected by purposive sampling. Data were collected using IPA questionnaire²⁵, serum cortisol levels measurement (Elisa) and stress perception questionnaire. Afterwards, the research result was analyzed by using Chi-square in order to observe the comparison among variables, then, it was conducted correlation analysis in order to investigate the correlation between stress perception and stress response.

Findings

IPA level on most of adolescents was high (Figure-1).

Figure-1. Distribution of IPA Level

The most of stress perception level was high (Figure-2).

Figure-2. Distribution of Stress Perception Level

Table 1 showed that there was no significant difference between stress perception score and IPA (p=0.097).

Table 1. Comparison of Stress Perception Score based on IPA Level

IPA	Stress Perception Score			p-value
	Mean	SD	Median	
High	55.10	2.83	55	0.097
Low	53.26	3.88	53	

The Stress Response Level on most of adolescents was high (Figure-3).

Figure-2. Distribution of Stress Response Level

Table 2 showed that there was significant difference between stress response and IPA (p=0.000) and significant difference between stress response and stress perception (p=0.016).

Table 2. Comparison of Stress Response based on IPA Level and Stress Perception

IPA	Stress Response Score			p-value
	Mean	SD	Median	
High	23.98	1.29	21.93	0.000
Low	12.20	4.01	11.60	
Stress Perception				
High	21.54	1.26	16.29	0.016
Low	12.97	5.80	11.60	

Discussion

Stress Perception

Most of stress perception on IPA was high. This condition was occurred more on female adolescents who accessed social network by using cellphone. Although it was not proven that there was a significant correlation between stress perception and respondent's characteristic, the activity of accessing internet since in early age was used for accessing others which did not have any advantages for learning process.

Adolescents were in identity crisis stage. They tended to have high curiosity and they were easy to be influenced by their peer friends²⁰. The adolescents

tended to have high confidence to access internet, but unstable, thus, they had not been able to select useful internet activities.

Phenomenon of internet addiction would influence other activities that impacted to imbalance in fulfilling other needs and contributing to personal distress or dangerous stress and could damage the adolescent development in the future^{13,14}.

Several researchers proved that internet addiction in long-term effect was dominated by negative impacts, such as depression, aggressive behavior, mental disorders, and stress²⁵⁻²⁹. In psychoneuroimmunology concept, stress is divided by two kinds, which are eustress and distress³. Eustress is stress that is needed to advance but if it is excessive, it will be distress.

Stress Response

Most of stress response on adolescent was high. The stress condition on IPA gave description that cortisol, product from hormonal reaction of the body due to stress, had spread into the body. Regulation of cortisol secretion was controlled by three organs, which were hypothalamus secreted Corticotrophin Releasing Hormone which would stimulate the anterior pituitary gland to secrete Adrenocorticotrophic Releasing Hormone which afterwards, it would stimulate adrenal cortex to secrete cortisol. Cortisol had important role in metabolism of protein and fat through increasing gluconeogenesis and it also had role in the process of adaptation against stress. In gluconeogenesis, it was occurred the increase of glucose secretion in the liver and changes in non-carbohydrate sources (amino acids) to be carbohydrates. Cortisol also caused lipolysis, thus, releasing free fatty acid increased, and it would be occurred centripetal fat deposits³⁰. Other functions of cortisol were regulating arteriolar tone and maintaining blood pressure (stimulating angiotensin II secretion), increasing glomerular filtration rate, water excretion, potassium excretion, sodium retention, and suppressing calcium uptake in renal tubules and intestines. This condition was caused by significant permissive effect of cortisol against other hormone activities. Epinephrine was one of hormone types which its activity was influenced by hormone level of cortisol. Moreover, cortisol must be in sufficient quantities for epinephrine in order to cause vasoconstriction. In stress condition, human body would increase epinephrine secretion until 300 times greater from normal level and it was depended

on type and intensity of stress stimulus³⁰. Cortisol increased epinephrine activity, thus, it was occurred the increase of heart rate and blood pressure.

The role of cortisol in helping the body to overcome anxiety or stress, and it was estimated that it related with its metabolic effect. Cortisol had metabolic effect which was increasing concentration of blood glucose by using protein and fat from the body. A logical assumption stated that the increase of glucose, amino acids, and fatty acids supply was available to be used when it was needed³⁰.

Correlation between Stress Perception and Stress Response

Stress perception in overcoming the impact of internet psychological addiction that was occurred would be responded by Hypothalamus-Pituitary-Adrenalin (HPA-axis), hence, it caused the cortisol level increased. If stressor that was accepted by hypothalamus was strong, the CRF that was secreted would increase more and more. Thus, stimulation that was accepted by pituitary also increased and cortisol secretion by the adrenal gland also increased. If the emotional condition had been stable, coping mechanism became positive, signal in the brain would hinder the release of CRF³¹⁻³². Due to stress, cortisol secretion could increase until 20 times greater. Stress was main factor in causing relapse in all addictions³³.

The use of internet excessively on IPA chronically would cause change of sensitivity in nervous system. Adolescents who were in condition of negative emotion or anxiety would increase cortisol level in the blood. Almost each response in the body, such as stress, could increase cortisol even in 20 times greater. The ability in regulating stressor until resulting different perception was really depended on their condition and perception against accepted stress³⁴. If their stress coping was good although there was stressor, the susceptibility against health problem could be reduced³⁵.

Conclusion

When the adolescents who underwent IPA was in stress condition, they could result perception against stress that would stimulate HPA axis, thus, CRF secretion by hypothalamus would increase. Then, it would be followed by the increase of ACTH by pituitary and the increase of cortisol secretion by adrenal gland.

The Prevalence of Sperm Parameters for Infertile Males in Thi-Qar City

Sumeya Ghanawy AL-Najjar

College of Medicine, University of Thi-Qar, Iraq

Abstract

Objective Male infertility is a term in which the male is not capable to attain pregnancy in a female. It occurs due to a lack of semen and low-quality semen. Semen Quality is referred to as a surrogate measure of male fecundity. This study aims to assess the frequency of sperm factors in infertile men in Thi-Qar City. Materials and Methods: This study involved an infertile couple, seminal fluid analysis (SFA) was done to evaluate male factors. Males with normal seminal fluid parameters were excluded. Regarding male, SFA was examined according to WHO 2010. Information such as age, duration of infertility and type of infertility were taken Results Among the percentage of abnormal sperm parameters for infertile couples in which the largest percentage was for asthenozoospermia that represent 66.70% of all infertile males. The second sperm abnormality is 12.13% for oligoasthenozoospermia. Asthenoteratozoospermia and oligoasthenoteratozoospermia have the same percentage (4.4). Azoospermia represents 6.7% while the lower percentage for teratozoospermia. Conclusions largest percentage was for asthenozoospermia that represents 66.70% of all infertile males .

Keywords: Seminal fluid analysis (SFA), sperm parameters

Introduction

Infertility is a different type of medical care as it relies on both male and female. Infertility is a unique medical condition because it involves a couple, rather than a single individual. In this condition, a couple fails to conceive after 1 year of intercourse without the usage of contraception in females less than the age of 35 years; and after the duration of 6 months of intercourse without the usage of contraception in females less than the age of 35 years and older (clinical definition) [1]. This is a very disturbing medical condition as the couple cannot have children if they are suffering from infertility. This further causes depression, psychological distress, and low self-esteem in the couple [2,3].

Types of male infertility

1. Asthenozoospermia

This term is described as the total sperm motility

(non-progressive and progressive), non-progressive motility is less than 40 percent and progressive motility is less than 32 percent. [4]

2. Oligozoospermia

A few months ago, the World Health Organization reevaluated the sperm criteria and announced a lower reference point which is less than 15M sperm/ML. (WHO 2010).[4]

3. Azoospermia

This term is described as the full absence of sperms from a minimum of 2 individual samples of centrifuged semen [4].

4. Teratozoospermia

Teratozoospermia; normal sperm morphology is <4% Kruger strict criteria [4]

Male infertility

There is a common misunderstanding that the female is responsible for infertility but, it has to be understood that male is equally responsible for this severe medical

dr.basim_moter@yahoo.com

condition [5].

Seminal fluid analysis

Materials and Method

The study was carried out at infertility unit in Thi Qar city patient. From February 2015 to July 2017. This study involved an infertile couple, SFA was done to evaluate malefactors. Males with normal seminal fluid parameters were excluded. Regarding male, SFA was examined according to WHO 2010. Information such as age, duration of infertility and type of infertility were taken

The seminal fluid sample was taken in a clean, sterile, and dry disposable Petri-dish after three to five days of sexual absence. This was done by masturbation in a quiet room near the laboratory of semen analysis. The dish was a label with the name of the male, his age, sexual intercourse absence period, and the exact time of sperms collection. The sample was liquified using an incubator at the temperature of 37 °C for half an hour. It was then mixed and analyzed by microscopic and macroscopic tests. To note the results of seminal fluid analysis, the standard form of (WHO 2010) was used (Table 1).

Table 1: Normal values of semen variables [4]

Sperm parameters		WHO Criteria
Sperm concentration millions/mL		15x10 ⁶ spermatozoa/mL or more
Total sperm motility (%)		>40%
Sperm Grade Activity	Progressive motility (%)	>32%
	Non Progressive motility (%)	
	Immotile sperm(%)	
Normal sperm morphology (%)		>30%*

Results

Figure 1 shows the percentage of abnormal sperm parameters for infertile couples in which the largest percentage was for asthenozoospermia that represent 66.70% of all infertile males. The second sperm abnormality is 12.13% for oligoasthenozoospermia Asthenoteratozoospermia and oligoasthenoteratozoospermia have a same percentage (4.4). Azoospermia represents 6.7% while the lower percentage for teratozoospermia.

In our study table, 2 show the effect of male infertility duration on sperm parameters. Regarding

sperm concentration there is a significant decline at 5-10years, also there is a significant decline in sperm morphology when duration more than 10 years.

Table 3 discuss the effect of male infertility type in sperm parameters whether primary or secondary. There is no significant difference between primary and secondary types for all sperm parameters (sperm concentration, motility, and morphology).

Table 4 shows the distribution into primary and secondary fertility among infertile couples, 60% of them with primary infertility and 40% with secondary infertility.

Figure 1. sperm parameters

Table2: Effect of male infertility duration on sperm parameters.

Infertility duration Parameters	1-5 years	5-10 years	≥10 years
Sperm concentration	44.417±4.10a	38.375±4.92b	46.944±5.74a
Progressive motility %	11.763±2.21a	8.081±2.58a	12.300±3.42a
Non-progressive motility %	28.383±2.69a	29.425±3.23a	32.178±4.17a
Immotile sperm	43.615±2.79b	44.813±4.38b	52.439±5.34a
sperm morphology %	52.944±3.67a	43.188±3.64b	45.468±2.47b

• Means with similar letters are nonsignificant different (P>0.05).

Means with different letters are significant deferments (P≤0.05).

Table3: Effect of male infertility type in sperm parameters.

Age groups Parameters	Primary	Secondary
Sperm concentration	42.459±3.59a	43.649±4.41a
Progressive motility %	10.298±1.80a	11.254±2.69a
Non progressive motility %	28.984±2.38a	30.141±2.93a
Immotile sperm	44.633±3.11a	47.265±2.84a
sperm morphology %	44.567±2.30a	48.595±3.05a

• Means with similar letters are non-significant different (P>0.05).

Means with different letters are significant deferments (P≤0.05).

Table 4: Distribution into primary and secondary fertility among infertile couples.

Infertility	Frequency	Percentage (%)
Primary	60	60%
Secondary	40	40%
Total	100	100%

Discussion

Moreover, the sperm parameters correlate negatively with increased period of infertility^[7]. These findings are in agreement with the results of the present study that the male patients with duration of infertility (1-5) years were with the lowest percentage of sperm motility.

The results of this study showed that primary infertility (60%) was more than secondary infertility (40%) as it is obvious from table 4. But, in men having primary infertility, genetic and chromosomal factors have a vital role in the presence of primary infertility than secondary infertility^[8].

A retrospective study, conducted between 1992 to 1999 highlights the occurrence of asthenozoospermia as 18.71% and for asthenozoospermia, it was 63.13%, linked with oligo- or teratozoospermia. So, 81.84 percent of the investigated samples indicated altered motility.^[9]

In research conducted in Nepal, 20% of the couples indicated semen abnormality. 47% indicated oligospermia while 39% indicated azoospermia. Moreover, 14% of males had asthenormia^[10].

Socioeconomic, environmental, and nutritional aspects are responsible for compromising the health of the male reproductive system [11]. Chemotherapy, radiation, and surgery may have an impact on spermatogenesis [12]. A research conducted in Senegal to check this abnormality, oligoasthenoteratonecrozoospermia showed the highest percentage that is 20.2 percent while azoospermia showed 14.5 percent and asthenonecrozoospermia and astheno-necrozoospermia both showed the occurrence as 10.3% [13]. However, Pontonnier indicates that oligoasthenoteratozoospermia is the chief abnormality that is usually found in the general population and particularly in varicocele [14].

Awareness of Medico-Legal Issues among Medical College Health Professionals

Tabitha Elizabeth Thomas¹, Magendran.J²

1 MBBS, Saveetha Medical College, Thandalam, Chennai, India, *2* Associate Professor, Department of Forensic Medicine, Saveetha Medical College, Thandalam, Chennai, India

Abstract

Introduction: Medicine, a noble profession, aims at providing healthcare service to the people. But today medical practice is much beyond the concept of service. It deals with legal issues and it is necessary for doctors to know about the various medico-legal aspects of their practice. A doctor is solely responsible for the patient who comes to him for treatment. A patient has all rights to sue the doctor if the treatment and care provided is not satisfactory. Assessment of awareness about medico-legal issues and related aspects among the health professional population thus becomes necessary.

Methodology: A cross sectional study was conducted using a self administered questionnaire with clinical scenario based questions. Responses were tabulated and analyzed.

Result: Most of the doctors are aware about various medico-legal issues and precautions to be followed to prevent getting involved in such situations. Doctors have knowledge about informed consent, record keeping, confidentiality etc.

Conclusion: Medical practitioners are well aware about the consequences they will have to face if treatment and care provision becomes faulty. They also have knowledge about the steps to be followed in order to protect themselves from getting involved in such situations. There is a need to spread awareness about medico-legal issues to further raise the quality of the service they provide.

Keywords: *Medico-legal cases, Informed consent, Confidentiality, Record keeping.*

Introduction

Medicine is a noble profession. It is considered as a pious profession all over the world. Its sole objective is improvement of quality of life and mitigation of sickness and suffering. It is not a mathematical process but a service oriented liberal profession having a self regulating code of ethics. The relationship between doctor and patient is based on hope and confidence ⁽¹⁾.

With commercialization spreading to all aspects, medical profession and services rendered are also

affected. There is growing anxiety both within the medical profession and in the society regarding increasing trends of complaints and law suits against physicians ⁽²⁾. It is necessary that doctors be aware of the legal aspects linked or associated to their profession and take the needful measures to protect themselves and their patients from legal traps. Knowledge of medico-legal issues is as fundamental to practice of medicine as clinical skills.

Today, with the development of internet and other media, patients are much aware about their condition and treatment to be taken. Practicing medicine in the present times is not an easy task. A doctor is solely responsible for each and every step he takes in providing care and treatment to his patients.

Hence a doctor must be aware of the consequences he or she might have to face if something goes wrong in patient care. A doctor must know about the precautions

to be taken when involved in a medico-legal issue.

MLC or medico-legal cases are an integral part of medical practice that is frequently encountered by medical officers. The occurrence of MLCs is on the increase, both in Civil as well as Armed Forces. Proper handling and documentation of these cases is very important to avoid legal complications⁽³⁾. Law suits for medico-legal issues can be minimized or avoided by taking steps to keep patients satisfied, adhering to policies and procedures, developing patient centre care and knowing ways of defending against malpractice judgments. Having comprehensive professional liability, insurance is a necessity in the present day litigious society⁽⁴⁾.

This study focuses on medico-legal issues and aspects in daily clinical practice. Doctors face a lot of situations involving medico-legal issues in their daily practice⁽⁵⁾. It is necessary to have knowledge about these medico-legal aspects. Assessment of awareness about medico-legal issues and related aspects among the health professional population thus becomes useful. This study aims at analyzing and assessing the awareness of medico-legal issues among doctors.

Methodology

A cross sectional study was conducted using a self structured questionnaire with 20 questions that was distributed among 100 doctors of Saveetha Medical College. Each question was a clinical scenario with a medico-legal aspect. Questions about informed consent, patient confidentiality, important acts like MTP ACT, medico-legal cases, record keeping etc. were included in the survey. Response to each situation was recorded and analyzed.

Doctors willing to participate in the study were given the structured questionnaire after receiving written informed consent form. Out of the 100 doctors surveyed, 54 were men and the other 46 were women. The questions were of multiple choice type and participants had to tick the right option for each question. None of the participants left any questions unanswered. The response rate was 100%. All participant details were kept confidential and then analysis was done using SPS software. Response to each question was tabulated, analyzed and percentage for the same was also calculated.

Result

Most of them believed the purpose of informed

consent was to protect both doctor and the patient while actually its main purpose was to protect the patient. 90% of the population were aware of the importance of informed consent (Fig: 1). They also take consent forms for various treatment procedures explaining to the patient about details, pros, cons and other treatment options available.

Regarding record keeping, 69% responded to maintaining records of MLC till the case is judged and 20% believed it to be 3 years (Fig: 2). 48% of the population feel that records of patients are their legal property while 37% don't so and the remaining 15% have no clear idea about this. In India it is a very common practice that the patient keeps all the records with him or her. In Government offered health services the records are with the respective hospitals, only the treatment summary is given to the patient during discharge or if need arises. In most of the corporate setups the patient's records are with the hospital and only copies in the form of treatment summary or photocopies of entire case file are given to the patient⁽⁶⁾.

Among the doctors who were a part of this study, 95% feel it is wrong to reveal the sex of the fetus during scanning. Still, 5% are not aware that it is unethical and a criminal offence to reveal the fetus gender. 74% have the knowledge about the period up to which MTP can be performed while some doctors are still not sure (Fig:3).

A good proportion, 91%, know that they are obliged to treat any patient coming to them for help and care, at least provide first aid with the facilities available. A majority support to the fact that there is a necessity of informing the police about medico-legal cases like suicidal attempt, road traffic accidents etc. (Fig: 4). They stick on to their duty of providing service, care and treatment even if the patient behaves violently.

Keeping the patient details confidential signifies the strength of doctor-patient relationship. Most of the doctors believed that revealing patient's personal details with regard to illness is wrong. But there are situations where details with regard to the patient can be disclosed among the members of the treating team.

Question: The main purpose of consent form is to...

A: Protect doctor

B: Protect patient

C: Both

C: Not sure

(Fig: 1) Awareness about informed consent

Question: How long do you have to keep the records of a patient if it is a medico-legal case?

- A: 2 years
- B: 3 years
- C: 5 years
- D: Till the case is judged

(Fig: 2) Awareness regarding record keeping

Question: The MTP act, 1971 permits termination of pregnancy for a broad range of conditions upto

- A: 22 wks of gestation
- B: 20 wks of gestation
- C: 25 wks of gestation
- D: 18 wks of gestation

Question: A case of suicidal poisoning comes to Emergency Department. Patient insists he doesn't want a MLC. What will you do?

- A: Agree to patient's request
- B: Disagree to patient's request

Discussion

The success of the health system depends on the medical personnel equipped with requisite knowledge, skills and attitudes towards patient rights (7, 8). This study was an attempt to investigate and assess the awareness of medico-legal issues among health care professionals of Saveetha Medical College, Chennai. The participants of this study included both doctors working in the clinical and non-clinical departments of the college.

Most of them were aware about the legal aspects of their practice.

Informed consent is a process for getting permission before conducting a healthcare intervention on a person (9). Consent signifies acceptance by a person of the consequences and complications of an act that is being carried out. Informed consent form aims at providing information to the patient about the procedure and consequences going to be performed on him or her (10). The main purpose of the consent form is to protect the patient. Consent is necessary for every medical examination and procedure (11).

Usually written consent is not taken for routine examination. But expressed consent is required for any procedure. In a study conducted in a medical college in Vadodara to assess knowledge and awareness of medical law and ethics among interns and residents, it was found that almost 90% of the respondents were aware of informed consent and 61% regarded informed consent with reasonable physician standard model as their choice (12). This study also has a similar result whereby 90% are aware about informed consent.

(Fig: 3) Awareness about MTP Act

(Fig: 4) Awareness about cases requiring police intimation

Written records, which include medical history, chart notes, radiographs, and photographs, must be meticulous, and it is necessary for the documents to be signed and dated. Legally, physician written records carry more weight than patient's recollections ⁽¹³⁾. Regarding record keeping and maintenance almost 70% believed that records of medico-legal cases must be maintained till the judgment of the case. But these results vary slightly from the study on medico-legal awareness amongst health professionals in Sudan where 94.5% agreed that hospitals must maintain records until the case is judged.

It is difficult to decide if to treat a patient behaving violently. Article 21 of the constitution guarantees protection of life and liberty to all citizens. Every individual has the right to life which includes right to healthcare and medical assistance. There is still confusion among doctors to decide if to provide treatment to violently behaving patients. Majority of the doctors agree to provide treatment to such people. The healthcare worker should take reasonably practicable steps to maintain a safe environment for patients and staffs. This helps in providing better patient care. If violence or aggression cannot be controlled so as to provide a safe working environment, the health service's duty to staff takes precedence over its duty of care of patients.

Health care services and professionals must work together to develop strategies to prevent and manage the risk of occupational violence ⁽¹⁴⁾. When compared to a study conducted to assess awareness and knowledge about medico-legal issues in a medical college in Vadodara, where more than half the respondents (55%) said that treatment should not be refused if the patient behaves

violently, the response in this study differed by 78% of the population agreeing to treat the patient despite his violent behaviour.

According to Section 357 C Cr.P.C., all hospitals, public or private, whether run by the Central Government, the State Government, local bodies or any other person, shall immediately, provide the first-aid or medical treatment, free of cost, to the victims of any offence covered under section 326A, 376, 376A, 376B, 376C, 376D or section 376E of the Indian Penal Code, and shall immediately inform the police of such incident. Thus a doctor has no right to deny treatment to any person who comes to him for treatment, be it a criminal, victim or an ordinary man ⁽¹⁵⁾.

Medical practice is a service and not accepting to help one in need of treatment and care is a criminal offence. When facilities at a clinic or a healthcare centre are not sufficient to provide complete care or treatment, a doctor can refer to nearby hospitals with sufficient facilities. This does not give him rights refuse first aid to an emergency case like road traffic accident with head injury. Necessary first aid should be provided and then only can he refer or shift the patient to a hospital with better facilities needed to sustain the patient's life.

Confidentiality is an implied term of contract between the doctor and his patient ⁽¹⁶⁾. The doctor is obliged to keep secret, everything he comes to know concerning the patient in the course of his professional work. There are situations where doctors of a treating team must know all details about the patient even if it is about HIV or Hepatitis ⁽¹⁷⁾. If an HIV positive patient approaches for treatment involving a surgery, then the doctor can inform his colleagues about it if they are a part of the treating team. Confidentiality regarding the patient is maintained within the treating team. A study conducted in Ghana reveals that there is no consensus among health care workers on confidentiality matters regarding management of HIV ⁽¹⁸⁾. There is a variation in this study where majority (91%) agrees to maintain confidentiality regarding matters like HIV and its treatment.

Conclusion

In general the doctor population of Saveetha Medical College is well aware of various medico-legal issues and its aspects in daily life practice. They do have knowledge and idea about various medico-legal issues and how to face them. They do have a general idea of

how to approach medico-legal cases and knowledge about the things they should follow in order to protect themselves from such issues and continue a successful career. Doctors must follow the guidelines provided in their practice. This will help them have a trouble free and a peaceful time while working. Guidance and awareness is necessary among health professionals to raise the quality of service they provide and also to protect themselves from the troubles and difficulties they might face in their practice.

Effect of Antenatal Exercise Teaching Program on Neonatal Outcomes During Delivery in Erbil, Iraq

Warda Hassan Abdullah¹, Badia Mohammed Najib¹

¹Department of Midwifery, College of Nursing, Hawler Medical University, Erbil, Kurdistan Region, Iraq

Abstract

Background: Antenatal exercises are safe and beneficial for the fetus, and neonatal health, wellbeing, were positive effect on neonatal outcomes during delivery, such as prevent fetal distress, remained the Apgar score and birth weight in normal range level. The aim of this study was to determine the effect of antenatal exercise classes on the neonatal outcomes during delivery. **Methods:** prospective -Interventional study was conducted in Maternal – Child Health Department in Najdi Heydari Health Care Center, Maternity and Razgary Teaching Hospitals / Erbil City / Kurdistan region / Iraq. One hundred and twelve healthy pregnant women. One half of the pregnant women were included in the intervention group (n = 56) and the other half in the control group (n= 56). The intervention group was educated about antenatal exercises. While the control group remained on standard maternal health care program (without exercise classes). Neonatal outcomes evaluated from documents of birth registry and mothers interview in the postpartum ward using a special check list prepared for that purposed.

Results: In the original data, there was a statistically significant difference between both groups. Regarding the fetal heart rate (P<0.01), Apgar score (P<0.004), neonatal complications (P<0.039), admission neonatal intensive care unit (P<0.003) through the progress of delivery. in other hand, not a statistically significant difference between intervention and control groups concerning neonatal weight. **Conclusion:** Antenatal exercise is recommended for healthy pregnant women as a safe and effective strategy, enhance the neonatal outcomes during the delivery process.

Key words: antenatal exercise, teaching program , neonatal outcomes

Introduction

The pregnancy phase is an interval of growth, development, and physiological change in mother and fetus¹. In uncomplicated pregnancies, women with or without a previously sedentary lifestyle should be encouraged to take part in aerobic and strength class exercises as a part of a healthy lifestyle¹. Both the American College of Obstetricians and Gynecologists and the Society of Obstetricians and Gynecologists of Canada currently recommend that in the absence of complications during pregnancy, pregnant women should exercise for half hour at a moderate intensity on

most, if not all, days of the week^{3,4,5}. Many evidences showed there was a significant effect of exercise training during the course of pregnancy on the fetal heart rate, fetal complications during labor and neonatal Apgar score^{6,7,8}, and the effect of exercise during pregnancy on the newborn's birth weight is unclear^{9,10}. Moderate to high level of continues maternal exercise have been associated with reduced birth weight¹¹. A few studies^{12,13} have found reduced birth weight among women who continue vigorous exercise during pregnancy compared with those who discontinue the exercise or who are sedentary.

In this study, we amid to evaluate the effectiveness of antenatal exercise classes on the neonatal outcomes during delivery in Erbil City / Kurdistan Region / Iraq.

Materials and Method

Tools for collecting data included the following:

assessment form was constructed by the researcher based on the literature and recommendations of antenatal exercises by the American College of Obstetrics and Gynecologists, 2015¹⁴, that included identifying demographic data, obstetrical history, assessment contraindications during pregnancy of the participants and checklist form. Content validity and reliability was secured. The sample size was calculated as 112 subjects based on PS program (power and sample size calculation) version 3.0.43. Who was attending the Maternal – Child Health Department in Najdi Heydari Health Care Center, Maternity and Razgary Teaching Hospitals, Erbil City, Kurdistan Region , Iraq. The subjects were selected using accessible sampling. The inclusion criteria were the following: age 18 - 40 years old, gestational age 17- 36, single tone pregnancy. Exclusion criteria were: free from contraindications of performing an exercise during pregnancy based on recommended of the American College of Obstetricians and Gynecologists (ACOG),2015 ⁴, as an obstetrician assessed all study participant subjects who had any medical health problem or pregnancy complications were excluded from the study. Subjects were purposely divided into intervention group 56 and control group 56. The intervention group was divided into nine subgroups and required to attend exercise classes for one hour weekly for four weeks. The purpose of the study was explained to all subjects in both

groups then informed consents were taken from them, and they completed the basic information forms which were prepared by researchers. The classes include the following:

- 1-Benefits, counterindications and discontinue of exercises during pregnancy.
- 2- Aerobic exercises and strength training of all the major muscle groups (walking or running and lower limbs relaxation exercise)
- 3- Pelvic floor exercises and birth ball exercise.
- 4- Coping in Labor (Helpful positions and breathing for labor).

During the classes demonstration of exercises and practical training, slides and pamphlets were used. All study participants were instructed to stopped exercises and reported immediately to the Maternity Teaching Hospital in the case of vaginal bleeding, abdominal contraction, vaginal fluid discharge. Participants in the control group received the routine care without attending classes. All participants who were unable to continue the program from both groups were excluded from the study finally subjects in the intervention group 48 and control group 49 Figure 1.

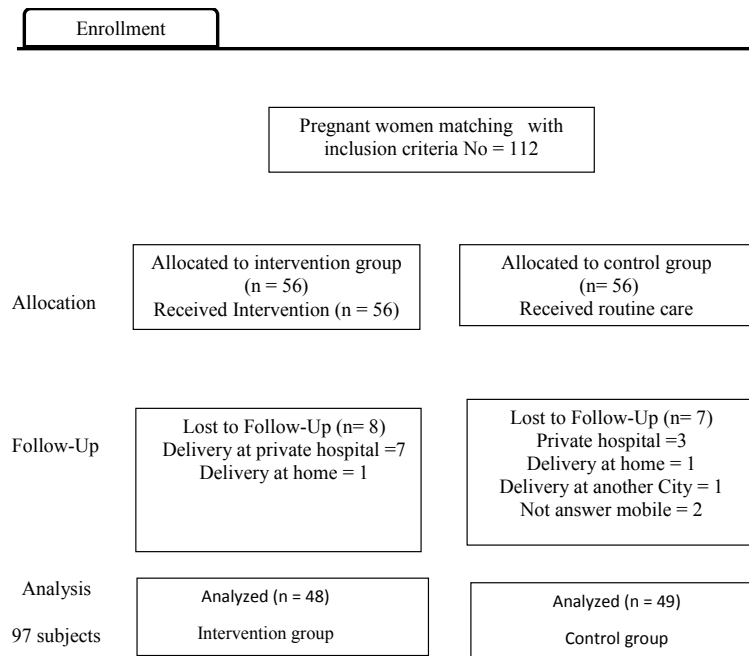

Fig 1. Flowchart of the participants through the study.

Outcomes and Statistical analysis

The delivery outcome of the fetus and neonatal (fetal heart rate, fetal complications during labor, Apgar score, birth weight, and admission neonatal intensive care unit) was evaluated from documents of birth registry and mothers interview in postpartum ward using a special checklist prepared for that purpose. Statistical analysis was performed using SPSS for Windows version 20.0 software. Chi-square tests, ANOVA test, and Fisher exact were used for comparisons of intervention and control groups data. A value of P values (< 0.05) was accepted as statistically significant.

Results

The present study findings that highest percentage (57.1%) (58.9%) of intervention and control groups respectively their age ranged between 20-29 years old and highest percentage (37%) of the intervention group had six years schooling were (32.1%) of the control group was Illiterate. The same table indicates that the highest percentage (91.1%) (92.9%) of both groups were housewives, respectively. Results also showed that demographic characteristic of both groups was homogeneous and no significant difference was observed between them regarding the age group, educational level and gravidity ($P<0.978$, $P<0.738$, $P<0.849$) respectively (Table 1).

Table 1: Demographic data of the study sample N= 112

Discussion

This study was carried out to determine the effect of antenatal exercise on neonatal outcomes during the delivery process. In the present study, the novel program was studied, the lower limbs relaxed, sitting on the birth ball, Kegel exercises (pelvic floor exercise), and breathing exercise and relaxation during labor are new phenomena for the pregnant women in Kurdish culture. Through this program were oriented the pregnant women about the importance of antenatal exercise and the effect of antenatal exercise on the neonatal outcome and their health wellbeing during delivery. The studies related antenatal exercise is limited but suggests that moderate exercise during uncomplicated pregnancy does not lead to adverse outcomes for the fetus and improves overall neonatal health well-being^{12,13,14,15}.

The present study showed that the fetal heart normal range 120 -160 bpm in the intervention group were higher than the control group, which a statistically significant difference between two groups ($P < 0.01$). Found a higher percentage of the fetal heart rate (less or above normal range 120-160 / bpm) in the control group (17.4% vs. 2.1%) respectively, the reason for abnormal fetal heart rate during delivery in the control group are due to prolonged labor, hypoxia and meconium¹⁴. Concerning the fetal complication, fetal distress was less reported during labor, also the rate of fetal distress in intervention group less than the control group. The reasons of fetal distress are due to prolonged labor, lack of fetal head descent into the pelvis, incomplete rotation of the fetal head hypoxia and meconium^{14,16}.

Another appealing finding in this study is that the Apgar score was higher in the intervention group compared to the control group at the first minute^{2,8,15}. Miquelutti et al and Nascimento to disagrees with the result of the present study, found that exercise during pregnancy has no effect and no significant difference between intervention and control groups regarding the Apgar score at first minute^{17,18}. Regarding birth weight, in the present study, we did not find a statistically significant difference in birth weight between intervention and control groups, we observed that the prevalence of newborns with birth weight between 2500 to < 4000 g was 89.6% (n = 43) in the intervention group vs. 89.8% (n = 44) in the control group, also was no a statistically significant difference between groups in low birth weight (<2500 g) or macrosomia (< 4000 g). The results of some studies are agreement with the present

study findings^{2,7,14, 18,19,20,21,22, 23} there are found that performing the exercise during pregnancy has no effect on birth weight.

We also found that the pregnant women performed of antenatal exercises had a significant association with their newborn admission to neonatal intensive care unit. The rate of referring newborn to neonatal intensive care unit in the intervention group less than the rate of neonatal admission in intensive care unit in a control group. 8.3% (n=4) in the intervention group vs. 32.7% (n= 16) in the control group needed admission to the neonatal intensive care unit after birth. were due to meconium aspiration, asphyxia¹⁷.

Conclusion

Antenatal exercise is recommended for healthy pregnant women as a safe and effective strategy for enhancing fetal and newborn outcomes (fetal heart rate, fetal complications during delivery, Apgar score and reduced birth weight and admission neonatal intensive care unit)

Conflict of Interests: None

Ethical Clearance: This perspective - intervention study, was approved by the Ethics Committee in the College of Nursing, Hawler Medical University (Registration No:8) and the Directorate of health in Erbil City, Kurdistan Region, Iraq.

Study of Dyslipidemia in Iraqi Hypertension Patients in Tikrit City

Zaidan Jayed Zaidan¹, Ahmed Moyed Hussein², Sheet Mutlak Ahmed³

¹Prof. ass. Internal medicine- Department of Medicine-College of Medicine-Tikrit University-Tikrit-Iraq,

²Interventional cardiologist, lecturer-Department of Medicine –Ninevah College of Medicine-Mosul-Iraq,

³Interventional cardiologist-Cardiology center-Tikrit Teaching Hospital-Tikrit-Iraq.

Abstract

Background: Hypertension is prevalent all over the world and represent a major health problem. Dyslipidemia is a major cause of cardiovascular morbidity and mortality. There is a correlation between hyperlipidemia and hypertension.

Aim of study: to find out the prevalence of dyslipidemia in Iraqi hypertension patients, and to find out how many of them on statin therapy, and how many reach target according to the last guidelines

Patients and methods: a cross-sectional study conducted in outpatient clinic in Salahaddin General Hospital in Tikrit City. About 344 hypertensive patients were included in this study. A questionnaires including general information about patients were filled and venous blood was drawn from every patient and sent for hospital lab to measure necessary investigations. ASCVD risk score was calculated for every patient by ASCVD Risk Estimator Plus. Then data were analyzed by application of Microsoft excel program and Statistical Package for Social Sciences (SPSS) version 23.

Results: (49%) of hypertension patients had total cholesterol of >200 mg/dl, (63.4%) had LDL of ≥ 115 mg/dl, (57.6%) had HDL of <40 mg/dl, and (54.1%) had triglycerides of ≥ 150 mg/dl. Smoker patients in this study had highest ASCVD risk score ($12.65 \pm 6.63\%$) followed by former smokers ($7.36 \pm 3.56\%$) and non-smokers ($6.02 \pm 4.16\%$). Only 76 (22.1%) of hypertension patients were on statin therapy for hyperlipidemia and only 18 (23.7%) of them reaching target LDL level according to 2016 ESC/EAS guidelines. While 268 (77.9%) of hypertension patients had no statin therapy and only 65 (24.3%) of them had LDL level within target.

Conclusion: Hyperlipidemia is very prevalent in hypertension patients in Tikrit City, despite that only one of five receiving treatment and only one of four from those who received treatment reaching the target of LDL level according to 2016 ESC/EAS guidelines, and three of four of those who are on no treatment are out of the target. This is a major health problem need attention.

hypertension defined as systolic blood pressure ≥ 140 mm Hg and/or diastolic blood pressure ≥ 90 mm Hg [1-3]. Because of its prevalence, hypertension represent a major health problem [4-7]. Hypertension affect about 32.6% of US population above 20 years of age [8]. In Iraq , about 35.6% of population above 18 years of age have hypertension [9]. Worldwide, dyslipidemia is a major cause of cardiovascular morbidity and mortality [10, 11]. Atherosclerosis is a progressive pathological process that lead to heart and cerebrovascular diseases [12,13] an dyslipidemia is a major risk factor of atherosclerosis.

About 39.6% of Iraqi population above 18 years of age have raised cholesterol or currently on statin treatment^[9]. There is a correlation between hyperlipidemia , hypertension and pulse pressure ^[14].

The aim of this study: to find out the prevalence of dyslipidemia in Iraqi hypertension patients, and to find out how many of them on statin therapy, and how many reach target according to the last guidelines.

Patients and method

This is a cross-sectional study conducted in outpatient clinic in Salahaddin General Hospital in Tikrit City, from 1st of January 2019 to 31st of May 2019. All established hypertension patients above 25 years of age that agreed to participate in this study were included.

Exclusion criteria: Patients with: established coronary or valvular heart disease, chronic kidney disease, diabetes mellitus , stroke or peripheral vascular disease were excluded.

About 344 hypertensive patients were included in this study after an oral informed consent taken from every patient . 156 (45.3%) of them were males, and 188 (54.7%) were females. Age range from (30-80) years with mean age of (50.34±10.35) years. Every patient was reviewed individually by a questionnaire including general information about patients beside smoking state and history of : cardiovascular disease, diabetes mellitus, chronic kidney disease or peripheral vascular disease, and history of treatment of dyslipidemia. Weight (Wt) and height (Ht) of every patient was recorded and body mass index (BMI) was calculated. Systolic and diastolic blood pressure of each patient was also recorded. Then 5 ml of venous blood was drawn from every fasting (for 14 hours) patient in this study and sent directly to hospital lab for measuring : fasting blood sugar, blood urea and serum creatinine to exclude diabetic patients and patients with Chronic kidney disease. Lipid profile including: serum total cholesterol, low density

lipoprotein (LDL), high density lipoprotein (HDL), very low density lipoprotein (vLDL) and serum triglycerides were also measured.

Then atherosclerosis cardiovascular disease (ASCVD) risk was calculated for every patient by ASCVD Risk Estimator Plus , an application provided by American College of Cardiology (ACC). Then patients were grouped into 4 groups: 1- low risk with ASCVD risk score of <1%, 2- moderate risk with ASCVD risk score of ≥1% and <5%, 3- high risk with ASCVD risk score of ≥5% and <10% and 4- very high risk with ASCVD risk score of ≥ 10% according to European Society of Cardiology (ESC) and European Atherosclerosis Society (EAS) 2016 guidelines for the management of dyslipidaemias ^[15].

Then data were analyzed by application of Microsoft excel program and Statistical Package for Social Sciences (SPSS) version 23. Outcomes of analysis were arranged into tables and figure. P-value was calculated by different probability tests.

Results

About 344 hypertensive patients were included in this study. 156 (45.3%) of them were males, and 188 (54.7%) were females. Age range from (30-80) years with mean age of (50.34±10.35) years. FB. sugar mean ± SD was (93.00±0.00 mg/dl) , B. urea mean ± SD was (33.79±6.82 mg/dl) ,and S. creatinine mean ± SD was (0.83±0.15 mg/dl).

About 171 patients (49%) had total cholesterol of >200 mg/dl (42.1% males and 57.9 females, and 218 of patients (63.4%) had LDL of ≥115 mg/dl (43.1% males and 56.9% females, and 198 of patients (57.6%) had HDL of <40 mg/dl (57.1% males and 42.9% females), and only 158 of patients (45.9%) had serum triglycerides of <150 mg/dl (38% males and 62% females. There was statistically significant increment of HDL and triglycerides in females as shown in table (1).

Variables	18.5-24.9 Kg/m ²	25-29.9 Kg/m ²	30≤ Kg/m ²	P. value
Total cholesterol (mg/dl)	210±46.21	200.37±41.57	212.38±54.84	0.132
HDL (mg/dl)	36.86±7.65	37.63±8.08	38.25±11.86	0.174
LDL (mg/dl)	144.71±44.84	127.46±33.03	134.06±41.22	0.815
Triglycerides (mg/dl)	123.71±32.34	190.44±128.34	179.88±114.87	0.133

Smoker patients in this study had highest ASCVD risk score (12.65±6.63%) followed by former smokers (7.36±3.56%) and non-smokers (6.02±4.16%) respectively as shown in table (3). The difference was statistically significant.

Table(3) ASCVD-score (Mean ±SD) among hypertension patients according to smoking status.

Variable	Smokers	Former	Non-smoker	P-value
ASCVD score (%)	12.65±6.63	7.36±3.56	6.02±4.16	<0.0001

In the present study there were 107 (31.1%) patients with hypertension had very high risk for developing ASCVD, most of them were males (65%), while 128 (37.2%) patients had moderate risk for developing ASCVD, most of them were females (71.9%) as shown in table (4). The difference was statistically significant.

Table (4) ASCVD risk according to 2016 ESC/EAS guidelines and gender distribution in hypertension patients.

Variables	Male		Female		Total		P-value
	No.	%	No.	%	No.	%	
Low risk	7	63.6	4	36.4	11	3.2	<0.0001
Moderate risk	36	28.1	92	71.9	128	37.2	
High risk	48	49.0	50	51.0	98	28.5	
Very high risk	65	60.7	42	39.3	107	31.1	

Only 76 (22.1%) of hypertension patients were on statin therapy for hyperlipidemia and only 18 (23.7%) of them reaching target LDL level according to 2016 ESC/EAS guidelines. While 268 (77.9%) of hypertension patients had no statin therapy and only 65 (24.3%) of

them had LDL level within target as shown in figure (1). The difference between treated and non- treated patients in reaching targeted LDL level was statistically not significant.

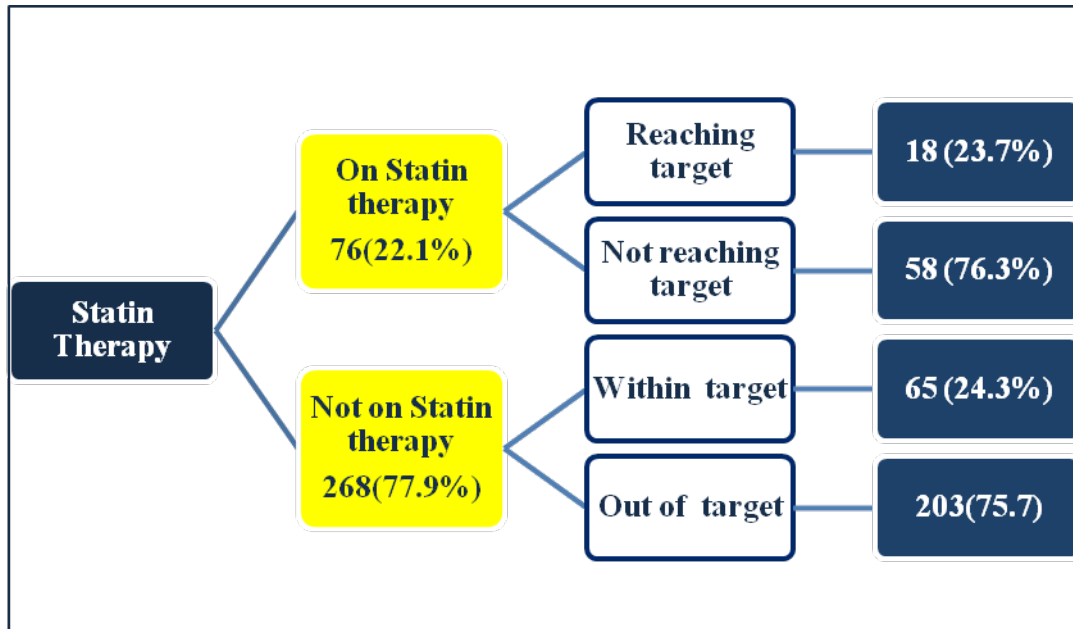

Figure (1) Flow-chart of hypertension patients according to using statin and reaching target of LDL level according to 2016 ESC/EAS guidelines.

Discussion

In the present study, females had levels of HDL and triglycerides significantly higher than that in males , while there was no significant difference in regard to levels of total cholesterol and LDL. Previous study ^[16,17] reported that sex -related differences in triglycerides, total cholesterol , HDL and LDL levels, other study ^[18] found no sex -related differences in TC and LDL in subjects aged 50 years and more but females had lower level of triglycerides and HDL than males. In another study ^[19] females aged 18 years and more had lower levels of triglycerides and LDL and higher level of HDL than males.

In the present study there was no significant differences in levels of total cholesterol, triglycerides, LDL and HDL among different BMI groups. Associations of adiposity at baseline and dyslipidemia have been shown in large prospective studies^[20-24], however there is inverse relationship between smoking and body weight ^[25], and smoking associated with low HDL ^[26], for this reason and perhaps using of statin therapy by some patients in this study may lead to these

results.

The present study revealed the effect of smoking on raising ASCVD risk and this is in agreement with other studies ^[27-30]. Also this study revealed that most of very high risk group for developing cardiovascular disease were men and this is in agreement of other studies ^[20-24].

The present study revealed that only 22.1% of Iraqi hypertension patients in Tikrit City on statin therapy and only 23.7% of them reaching target of LDL level , while 77.9% of them are not on any treatment for hyperlipidemia, although 75.7% of them are out of target of LDL level according to 2016 ESC/EAS guidelines. This is comparable to a study done in Russia ^[31].

Conclusion

Hyperlipidemia is very prevalent in hypertension patients in Tikrit City, despite that only one of five receiving treatment and only one of four from those who received treatment reaching the target of LDL level according to 2016 ESC/EAS guidelines, and three of four of those who are on no treatment are out of the target. This is a major health problem need attention.

Isolating Some Pathogenic Bacteria from Packed Milk and Detecting of Formalin in its Components

Zainab Alag Hassan¹, Ali Aboud Shareef², Majid Ahmed Kadhim³, Abdulameer Abdullah Al-Mussawi⁴

¹Lecturer / College of Nursing, University of Basrah, Basrah, Iraq, ²Assistant Professor / Department of Biology, College of Education for Pure Sciences, University of Basrah, Basrah, ³Assistant lecturer / Al-Sadr Teaching Hospital, Central Laboratory, Iraq, ⁴Professor / College of Nursing, University of Basrah, Basrah, Iraq

Abstract

Aims: The main aims of this study is to isolate pathogenic bacteria from packed milk in Basrah city, and to detect the presence of formalin in milk samples.

Methodology: A total of 9 types of packed milk were collected from the market in different period. The samples were transported to the laboratory in cooling conditions. They were stored in a refrigerator and analyzed within 24 hours. One ml from each sample was diluted in 9ml sterile distilled water, the diluted sample was a streak inoculated on chromogenic media. Three ml of milk sample was taken in a test tube and diluted with equal size of water. 5ml of sulfuric acid (90%) were added to the diluted milk slowly to the side of test tube which must handle with slant position in order to form separation layer. In case of formaldehyde presence a violet layer will form. This method detect of 1 part of formaldehyde in 200000 parts of milk

Result: The result showed only *Staphylococcus saprophyticus* and *Staphylococcus aureus* have been isolated from milk samples (23.4 %) and (10.6 %) respectively. The result showed that high temperature not very effective since two pathogenic bacterial species have been isolated and formalin have been detected in milk samples. The result showed no effect of addition of formalin in some sample and did not inhibit the growth of bacteria.

Conclusions: This study concludes that most of the packed milk under study contaminated with some pathogenic bacterial species, most of milk samples contained formalin.

Key words: Bacteria, Milk, Formalin, Basrah

Introduction

Milk and its products have been an important part of the human diet for some 8000 years and are part of the official nutritional recommendations in many countries worldwide. Milk products are rich in calcium, protein, potassium and phosphorus and it is very important for children and adolescents because it contains numerous essential nutrients so it provides around 52–65 % of the dietary reference intake of calcium and 20–28 % of the protein requirement^{1,2}. Some of the bacteria contained in

milk (such as *Lactobacillus spp* or *Bifidobacterium spp.*) are also present in the healthy human gastrointestinal tract, aiding in digestion and protection from other infections, while other bacteria can be extremely harmful to human health. Milk can be polluted by *Mycobacterium bovis*, *Brucella* species, *Streptococci* and *Coxiella burnetii* from infected cattle. Agents from human sources such as *Salmonella* species, *Shigella* species, *Corynebacterium diphtheria* and *Streptococcus* species can also be presented in milk³.

Many preservatives such as nitrate, boric acid, salicylic acid, hydrogen peroxide, formalin, carbonate and bicarbonate are adding to milk to improve keeping quality of milk and to delay spoilage is a problem for regulatory bodies from the early history of dairying. The toxic effect, hypersensitivity, teratogenic effect

Tel. No: 00964-7718883937

and carcinogenic effect are the most common serious public health hazard appears as a result of accumulation of preservatives⁴. The addition of Formalinas adulterant in milk affects on the health of consumers; it causes vomiting, diarrhea and abdominal pain. Larger doses may cause decreased body temp, shallow respiration, weak irregular pulse and unconscious. It also affects the optic nerve and cause blindness. It is one of the potent carcinogens⁵. Therefore the present study was performed to throw out a light on the microbiological examination for detecting pathogenic bacteria and formalin detection in packed milk.

Methodology

Collection of milk products

Nine types of packed milk were collected from the market in different period. The samples weretransported to the laboratory in cooling conditions. They werestored in a refrigerator and analyzed within 24hours⁶.

Microbiological analysis

One ml of each sample was diluted in 9ml sterile distilled water. The diluted sample was a streak inoculated on chromogenic media as given below:

**Staphylococcus* chromagar (Paris, France) used to isolate *Staphylococcus aureus* and *Staph. Saprophyticus*.

**E. coli* chromagar (Paris, France) used to isolate

Escherichia coli and other gram negative bacteria.

*Salmonellchromagar (Paris, France) used to isolate *Salmonella* spp.

**Pseudomonas*chromagar (Paris, France) used to isolate *Pseudomonasaeruginosa*

Detection of formaldehyde presence

Three ml of milk sample was taken in a test tube and diluted with equal size of water. 5 ml of sulfuric acid (90%) were added to the diluted milk slowly to the side of test tube which must handle with slant position in order to form separation layer. In case of formaldehyde presence a violet layer will form. This method detect of 1 part of formaldehyde in 200000 part of milk⁷.

Results

The recent study was detected of pathogenic bacteria(*Escherichia coli*, *Salmonella typhi*, *Staphylococcus aureus*, *Staphylococcus saprophyticus* and *Pseudomonas aeroginosa*) in packed milk samples from different origin of products in more than one date of production (November 2018 to February 2019). Only, *S. saprophyticus* and *S. aureus* have been isolated from milk samples (23.4%) and (10.6%) respectively. The CFU number of *S. aureus* and *S. saprophyticus* isolated from milk samples was documented in Table 1.

Table 1: number of bacterial colony forming unit (CFU) on chromo agar media

Type of sample/origin of product	No. of samples	Number of CFU	
		<i>S. aureus</i>	<i>S. saprophyticus</i>
Safio /KSA	1		Uncountable
Almarai/ KSA	1	1	
	2		1
	3		1
KDD/ Kuwait	1	2	6
	2	Uncountable	
	3		1
	4		3
	5		Uncountable
	6		1
Kalleh /Iran	1	1	
	2		1
	3		1

All samples under study have been written on its packet “sterilized by high temperature” and no added preservative was mentioned. However, the result showed that high temperature not very effective since two pathogenic bacterial species have been isolated and formalin have been detected in milk samples (Table 2). In some samples, the addition of formalin to milk also did not inhibit the growth of bacteria.

The lack of mention of the ingredients of any particular food products, especially the presence of preservatives is a commercial fraud.

Table 2: Number of milk samples contain formalin

Sr.No.	Type of sample / origin of product	Total number of samples	No. of the samples contain formalin
1	Safio /KSA	8	2
2	Almarai/ KSA	8	8
3	KDD/ Kuwait	11	11
4	Kalleh /Iran	6	–
5	Farms alsaba/Syria	3	–
6	Tiffany /UAE	6	3
7	Nesquik/ Turkey	2	2
8	Alis / Iran	2	2
9	Nada/ KSA	1	1

Discussion

Iraq relies heavily on imported products, so that there was no Iraqi milk available during the collection of samples from the market. There are Iraqi products of yogurt and cheese, but not packaged milk. The packaged milk found in the Iraqi markets is a Saudi, Kuwaiti, Turkish, Iranian, UAE and few Syrian ones. Since, the war in Syria have been started, Syrian products decreased in Iraqi markets. Formaldehyde is quickly absorbed from the gastrointestinal tract following ingestion and quickly diffuses into many tissues, including the brain, testis, and liver⁸ which makes it a dangerous chemical to be used as preservative^{9,10}. Toxicological effects including histopathological alteration in the stomach (i.e., gastrointestinal lesions (such as papillomata’s

hyperplasia and hyperkeratosis), allergy, asthma¹¹, abdominal pain and vomiting.

A Bangladesh study showed some severe histological alterations in liver and kidney in treated mice, which were fed with formalin as 30µl, 3µl and 0.3µl for 30 days¹². Formalin is significantly related with cancer, particularly nasopharyngeal cancer in humans through inhalation during occupational exposure¹³. Sometimes caused gastrointestinal cancer when present with high concentration in drinking water¹⁴. Consumption of foods contaminated with this dangerous chemical exposes humans, particularly kids and elderly to severe health problems in Iraq and some developing countries. We conclude that most of the packed milk under study contaminated with some pathogenic bacterial species, most of milk samples contained formalin.

Screening Study for Some Strains of *E. Coli* Collected from Five regions in Kurdistan-Iraq for its Sensitivity, Resistance and MDR against Thirteen Antibiotics

Asma Sumiea Afram Karomi

Department of Biology, College of Science, University of Kirkuk, Kirkuk, Iraq

Abstract

Background: New strains of bacteria, which are sensitive and resistant to antibiotics, has been selected due to the overuse of antibiotics. The profiles of *Escherichia coli* (*E. coli*), which is resistant to antibiotics, are taken from different samples of human fecal and urine.

Aims: This article investigates the occurrence and observing the sources of *E. coli*, which is sensitive and resistant to antibiotics. The study samples are collected from human urine and fecal by limited inhibition zone.

Results: The study revealed a 92% sensitivity to Chloramphenicol and Gentamycin, 77% to Clarithromycin and Neomycin and 54% to Doxycycline. While the lowest sensitivity level was documented for Erythromycin and Novobiocin represented by 6.8%. Furthermore, the lowest level of sensitivity was reported for Erythromycin, and represented by 38% in comparison to control. Moreover, the sensitivity to penicillin was low. Besides, this study revealed that the isolated samples of *E. coli* were highly resistant to the multiple antibiotic resistance of the three antibiotics, namely Ampicillin, Lincomycin and Rifampin during the same time.

Conclusion: All of the antibiotics used in this study had a clear impact against *E. coli* bacteria as antimicrobial drugs to inhibit its growth and infection.

Keywords: *E. coli*, Antibiotics resistance, Antibiotics sensitivity.

Introduction

E. coli is gram-negative bacilli, facultative anaerobic bacteria that belong to the *Enterobacteriaceae* family¹, and propelled by long flagella. It is found in the intestinal tracts of human and animal due to faecal contamination or food contamination during the slaughter of an animal. It frequently exists in food, water and soil². Furthermore, *E. coli* causes lower urinary tract infection, septicaemia or coleocystis. Resistance to multiple drugs in human pathogenic bacteria has been established because of the random use of commercial antibacterial medicines commonly utilized in treating infectious diseases. In the literature, there are a number of factors impact of developing resistance to antibiotics. These factors include 1) the specific nature of the relationship between bacteria and antibiotics; 2) using an antimicrobial agent; 3) characteristics =of the host; and 4) ecological factors.

Generally, bacteria have the genetic ability to transmit and acquire resistance to drugs, which are used as therapeutic agents³.

Antibiotic resistance

It is well known that the extended-spectrum β lactamases (ESBLs) are produced by multidrug-resistant *Enterobacteriaceae*, commonly *E. coli* (e.g., the enzymes of CTX-M). These enzymes are more active against cefotaxime than other oxyimino-beta-lactam substrates like ceftazidime, ceftriaxone or cefepime. They are defined within the setting of the community as a significant cause of urinary tract infections (UTIs). Recently, there are studies describing ESBL-producing *E. coli* as being a cause of bloodstream infections related to these community-onsets of UTI⁴. It is an organism that occurs widely in sewage because it is a

faecal coliform. It has a significant role in the analysis of water sanitary. Over the past fifty years, two studies conducted by Maaloe and his colleagues have described the growth rate regulation in bacteria for the first time. This has been a significant issue in bacterial physiology⁵. The virulence factor (toxicity) of *E. coli* explains its pathogenicity. There are varied factors that define the pathogenicity of *E. coli*. Based on the nature of these factors, various infections may be caused by these strains, including skin wounds infections⁶.

Pathogenic strains of this organism are distinguished from normal flora by the presence of virulence factors, such as exotoxins. *E. coli*, also known as UPEC, is the most prevalent extra digestive pathogen that causes UTI in children and accounts for about 80-90% of the community-acquired cases. Five pathogenic strains of *E. coli* are frequently isolated from humans and animals suffering from diarrhea. *E. coli* is the most commonly recognized bacterial pathogen in infantile gastroenteritis⁷.

Recently, bacteria species resistant to antibiotics are formal in the environments. The negative effect of bacteria has considerably increased. Resistance to antibiotics in *E. coli* is totally defined in isolates from human, animal and environmental sources. Among the antibiotics, Ampicillin, that belongs to the penicillin family, is used to treat and study these bacteria. The standard Kirby-Bauer disk diffusion method has been employed in this study for determining the profiles of antibacterial sensitivity of the *E. coli* isolates with different antimicrobial agents¹.

Aim and Objectives

This article investigates the occurrence and observing the sources of *E. coli*. The objectives of this work are as follows:

Isolating pure culture of *E. coli* from human fecal samples.

Assessing the antibacterial effectiveness of antibiotics against isolates under study.

Describing resistant strains for the antibiotics used in this study.

Limited multi drug antibiotics (MDA) resistant.

Material and Method

Collection of Stool Specimens

This study included 250 male and female patients. The ages were ranged between 6 months and 5 years. Fifteen samples were selected from 5 years (i.e., positive sample) that included 2 control (not infected). *E. coli* was taken from human fecal. The samples were obtained from hospitals in areas of Soran, Qaladwza, Hawler, Rania and Koya in the Kurdistan region, Iraq. The period of sample collection was during the period from October 2014 to April 2015. The samples were transferred to the laboratories of the research center at the University of Soran. *E. coli* was isolated using the bacteriological and biochemical test of fecal sample collected from patients¹.

The gram-stained slides were obtained from the Central Drug House (P) Ltd. (CDH), which was tested microscopically. Samples were cultivated on Nutrient Broth (Lab M™, Bury, UK) to activate the bacterial isolation of the chemical test reactions (37 °C, 24 h). After that, they were transferred on selective media (Mac Conkey agar, Lab. M. Limited UK) to isolate the rod to the negative gram bacteria and differentiate between fermented and non-fermented isolates of sugar Lactose, Eosin methylene blue (EMB) agar Himedia. The ionic dye contained two blue ones planted by *E. coli*, giving a bright color green. Concerning the final identification, tests of API 20E Biomerieux were used⁸.

Culture media

The preparation of all media utilized in the current study was done in accordance with their manufacturers.

Isolation of bacteria (*E. coli*):

Culture media used were MacConkey agar, EMB agar, Nutrient agar and Blood agar. The standard loop was sterilized and dived in a vertical way after cooling in fecal samples, filed and immediately transported to culture media by duplicate streaking. One of the streaked plates was incubated under aerobic conditions of growth, and the other one was incubated under partial anaerobic conditions of growth with 5% of CO₂. Finally, all streaked plates were placed at 37 °C for 24 hours⁹.

Identification of bacterial isolates

Culture media were prepared for the purpose of purification, conservation, revitalization, quality

appearance identification, cultural recipes and for making a biochemical test of the bacterial isolates. Also, the dyes, solvents and reagents were used to complete biochemical tests as clarified below:

Characteristics of the developed colonies:

The colonies observed on culture media were distinguished according to the following: 1) color; 2) the surface of the colony; 3) strength; 4) transparency; 5) smell; 6) lactose fermentation on Macconkey agar; and 7) the appearance of metallic sheen on EMB agar for *E. coli*⁹.

Microscopic examination:

Smears of each type of appeared colonies were prepared. Gram stain was done to examine the microbial cells gram positivity and negativity as well as cells arrangement⁹.

Biochemical tests:

In the literature, Biochemical tests were done to distinguish *E. coli* and *Staphylococcus epidermidis* from other bacterial isolates. They included Catalase, Oxidase, Coagulase Voges Proskauer, Methyl red, Motility test, Urease, Indol, H₂S Production, Citrate utilization, Sugar fermentation Haemolysis⁹.

Preparation of McFarland turbidity standard No. 0.5

In this study, 50 µl of a 1.175% (wt/vol) barium chloride dihydrate (BaCl₂•2H₂O) solution was added to 9.95 ml of 1% (vol/vol) sulfuric acid to prepare the 0.5 McFarland turbidity standard. Next, the McFarland standard tube was sealed with Parafilm for preventing evaporation. Then, it was stored in a dark place at room temperature. After that, the density accuracy of the prepared McFarland standard was examined through utilizing a spectrophotometer with a 1 -cm light path for the 0.5 McFarland standard, the absorbance at a wavelength of 625 nm and water as a blank standard was 0.08 to 0.13. The turbidity was vigorously agitated by the 0.5 McFarland standard on a vortex mixer before use. As with the barium sulfate standards, a 0.5 McFarland Standard was analogous to a microbial suspension of 1.5 X 10⁸ colony-forming units (CFU)/ml¹⁰.

Antibiotics Tests

Antibiotic discs

High potency discs of the following 13 antibiotics were used against all *E. coli*: Streptomycin (S), Novobiocin (NV), Neomycin (N), Lincomycin (L), Norfloxacin (NOR), Chloramphenicol (C), Doxycycline (DO), Rifampin (RA), Ampicillin (Am), Erythromycin (E), Tetracycline (TE), Gentamycin (CN), Clarithromycin (CLR).

Antibiotic resistance screening test

The resistance of test strains to different antibiotics was determined using the disk diffusion method as described by the Clinical and Laboratory Standard Institute (CLSI) standards. The test strains were first enriched in nutrient broth for 24 h at 37 °C by picking off technique. By using sterile swab sticks, plates were seeded with 1 ml of a suspension of the test strains containing approximately 10⁶ cells. Antibiotic discs were dispensed on the plates seeded with organisms. The plates were incubated at 37 °C for 24 h, and antibiotic resistance was interpreted by inhibition¹¹.

Results and Discussion:

Outcomes of isolation and identification of tested bacteria

There is a significant reason for mortality and morbidity throughout the world, represented by bacterial infectious diseases. Consequently, there is an increasing interest in developing new antibacterial agents for treating bacterial infections.

Source of isolates	Number of isolates	Number (%) of isolates that showed resistance to multiple antibiotics 3 antibiotics L, RA , Am
Children	13	100%

Prevalence of *E. coli* that is sensitive and resistant to antibiotics isolated from faecal samples:

The results showed that all of the *E. coli* isolates from human fecal are resistant to all medicines at different levels to different antibiotics. As illustrated in Table 2, 53% of the isolates were sensitive to antibiotics, 41% resistant, and 6% intermediate resistant. Some isolates under study showed sensitivity to Erythromycin compared with the control, which gave a negative result. There was a possibility that these isolates were Rfactor. According to Table 3, 92% of Chloramphenicol and Gentamycin, 77% of Neomycin and clarithromycin, 54% of Doxycyclin, 38% Novobiocin and erythromycin, 10% of Streptomycin and Norfloxacin.

Nevertheless, equal amounts (100%) of isolates were found to be resistant to Ampicillin, Lincomycin and Rifampin, 70% of Tetracycline, 62% of erythromycin, 46% of Doxycyclin, 23% of clarithromycin and Neomycin (see Table 4). These results were consistent with those of studies of Masuder (2007), and Zinnah et al. (2008) for above 80% and 53% of the *E. coli* isolates from human fecal were sensitive to Gentamycin, Clarithromycin and Neomycin, respectively. Simultaneously, these studies differ from the current research, as only 8 % of isolates showed resistance to Gentamycin. Also, this study is consistent with that of Wolde Tenssay (2002), which revealed that 100% and 79% of isolates showed resistance to amoxicillin and tetracycline, respectively. Nevertheless, results of this

study are similar to those of in terms of the isolates percentage (50%) that are resistant to tetracycline and due to the insignificant percentage of *E. coli* isolates from human fecal and urine that showed resistance to cotrimoxazole, respectively. Likewise, the current paper was consistent with that of ¹² in that a very unimportant number of isolates reported resistance to norfloxacin. Table 5 shows that the isolates are intermediately resistant to antibiotics depending on the inhibition zone.

Bacteria that were resistant to multiple drugs were taken from fecal samples that were collected at Al-Iklem (see Table 6) represented by 13 *E. coli* isolates examined for revealing resistance to antibiotics. All of them (100%) demonstrated multiple resistance for antibiotics ¹³. Finally, similar studies conducted in and nearby Jimma, Ethiopia indicated that nearly all *E. coli* isolates from environmental sources showed resistance to the frequently used antibacterial medicines including amoxicillin, tetracycline and cotrimoxazole.

Conclusion

From the above findings, we conclude the following:

All antibiotics used in this study had a clear impact against *E. coli* bacteria as antimicrobial drugs to inhibit their growth and infection.

The isolated strains of *E. coli* have a highly sensitive effect on the third-generation aminoglycosides, fourth-generation cephalosporins and carbapenem.

The method of disc diffusion is simple, reliable and low-cost for examining the *E. coli* susceptibility to Am, S, N, L, NOR, C, DO, RA, E, TE, CN, CLR.

Limited MDR depending on the resistant zone, the study found multiple resistance to three types of L, RA and Am.

The Role of Silver (Ag) Nanoparticles synthesis by *Penicillium spp* against the Toxicity of *Echinococcus Granulosus* in Adult Albino Male Rats

Ahmed Hamad Saleh¹ Hussein A.R. Abbood¹

¹Medical Analysis department/ Al-Qalam College /Kirkuk /Iraq

Abstract

The aim of the study was to synthesize Ag nanoparticles by using filamentous fungus

Penicillium sp. The fungal culture was isolated from the soil samples collected from agriculture fields in Kirkuk city. The synthesis of silver nanoparticles was investigated by X-ray diffraction peaks were measured at (101), (200) and (202) respectively, and scanning electron microscopy .

The present study was designed to indicated the role of Ag nanoparticles synthesis by *Penicillium spp* against toxicity of *Echinococcus granulosus*. The present study used twenty adult albino male rats that distributed at random to following teams (each group consist five rats); management group received ad libidium, second group injected with $2,5 \times 10^3$ of *Echinococcus granulosus* protoscolices third group injected with protoscolices and treatd with 50 mg/kg AgNanoPs, fourth group injected with protoscolices and treatd with 100mg/kg AgNanoPs. The results show high important exaggerated ($P < 0.05$) in levels of MDA (malonedialdehyied) and important decrease ($P < 0.05$) in levels of glutathione (GSH) and catalase compared with management group. While, after used AgNPs with *Echinococcus granulosus*, the results indicated non-significant changes ($P < 0.05$) in MDA, GSH and catalase also showed non-significant changes ($P < 0.05$) compared with control group. histological study show decrease in numbers of spermatogonia and spermatocytes with absent of spermatid. While, after using AgNPs the testis in third and fourth groups appear semi-normal. It had been ended that AgNanoPs has been potential role against toxcicity of *Echinococcus granulosus* in rats male.

Keywords: Ag nanoparticles; *Echinococcus granulosus*; testis.

Introduction

Cystic Echinococcosis (CE) is one of the most important zoonotic helminthic diseases throughout the world (1). The larval stage of the *Echinococcus granulosus* leads to hydatidosis (2). Adult worms live in the small intestine of canids as definitive hosts with a high prevalence in the world (3, 4). Intermediate hosts include humans as well as cows, sheep, camels, horses et al that acquire the infection by oral uptake of tapeworm eggs. once intake by appropriate host and sequent passage through abdomen and intestinal, the oncosphere brute become activated, penetrate the tissue layer, enter to the blood stream and body fluid vessels and area unit disseminated within the body. once associate indefinable time period, *E. granulosus* metacestodes area unit shaped (1, 5). Nano-biotechnology is presently

one among the foremost dynamic disciplines of analysis in modern material science whereby plants and totally different plant merchandise ar finding an important use within the synthesis of nanoprticles (NPs) (6, 7). in nano-biotechnological analysis, AgNPs have received important attention owing to their distinctive physical chemical, biological properties, and since of their pertinence in natural philosophy, optics and drugs (8). Among diverse nanaoparticles, Ag nanoparticles because various properties like chemical change,, chemical science conduction and antimicrobial activity, are often employed in completely different applications like biomedicine, agriculture, icon chemicals and food chemistry (9, 10). The present study was designed to indicate the role of green Ag nanoparticles againted toxicity of *Echinococcus granulosus*.

Materials & Method

Animal model

In this study twenty adult male albino rats, (wt 225-275 gm with age 4-6 month) obtained from Technicals college/ North Technical University, and unbroken on customary pellete diet for week to insure its normal.

Isolation sample

Soil samples were obtained from town of city. For soil suspension preparation, CaCO₃ was treated with one0: 1 weight / weight and incubated in brooder at thirty seven ° C for four days. For drying functions, a series of ten - so took 0.5 milliliter of dilutions 10-3.10.4 and placed in sterile Petri dishes and poured within the middle of the sterile PDA and fluid to (50-45) m and stirred the dish to homogenize the soil answer with the middle of the plant so incubated for 6-4 days when uninflected the isolates and diagnosing, looking on.

Preparation of fungal biomass and composition of silver nanoparticles

The fungal fungus was prepared by taking a tablet of the clean, pure fungal colony using a 7 mm sterile veneer hole, where the developing colony edges were punctured on the fungal growth plate and placed in a 100 mL conical flask of the liquid MYPG medium where it was quietly placed to the disc on the center surface After a period of time, the disk stabilized on the surface of the liquid medium, and then placed in the incubator at 26 ° C for 5-7 days to obtain a mat with different weights (11). After the fungus was nominated the fungal mass using the filter paper(Whatman filter paper NO 1) And then rinsed thoroughly with distilled water to remove the residue of the medium. The fungal flask was then placed in a conical flask containing 100 ml of distilled distilled water and left for 72-24 hours in the incubator. The fungal mass was again filtered using filter paper to ensure that all components of the medium were removed. Filtration in an electric oven of Memmert (Germany) at a temperature of 50 m. The dry weight of the fungus was measured by weight between the dried paper mass with its contents after filtration and the filter paper block. It was dried before filtration. 10 g of fungal mass and then placed in 100 ml of Ag NO₃ prepared silver nitrate With a concentration of 1mM and placed in the incubator In completely dark conditions and after chromatography, AgNPs were examined x-ray shimadzu during a laboratory within the academic department - school of

Science, University Bagdad. The scanning microscopy SEM (Scaning negatron Microscopy) (TESCAN-VEGA) was conjointly employed in the engineering center.

Echinococcus granulosus

hydatid cysts were collected and obtained from infected sheep livers. They were put in plastic bags, and transported to the Department of biological science , school Technical , North Technical University, wherever protoscolices were isolated from livers in keeping with (12) technique . Protoscolices indicates the fertility of hydatid cyst and it's were counted according to method cited by(13). cyst and it's were counted in keeping with technique cited by (13). The viable protoscolices for parasite were counted in oneml from supernatal supported the formula : Viability in 1 metric capacity unit = variety of protoscolices in (10 µl) × one hundred.

Experimental design

Twenty adult male albino rats were used and divided as follow (each groupe consist 5 rats):

management group: rats were received normal pellet diet just for seven days so killed..

Positive group rats injected with protoscolices, and so killed.

Third group rats injected with protoscolices and treated with 50mg/kg Ag NanoPs for month, and so killed.

Fourth group rats injected with protoscolices and treated with 100mg/kg Ag NPs for month, and then killed.

Prepare of blood solution

The blood collection from rats by internal organ puncher, below anaesthesia, and place in check tubes . After clotting, the tubes were activity for ten min to get sera. The bodily fluid was taken and hold on by deep phase transition till used.

Homogenization

Testis samples were removed immediately and the put in glass dish contents 0.9% NaCl buffer for washing and removed the blood. To oxidative stress factors determination, 10% from organ weight was dissolved with buffer (PH 7.4) and the organ tissue was crashed

by use ceramic mortar. Then mixture was centrifugation for 10 min. Supernatant was taken and stored by deep freezing till used (14).

Measurements

Plasma Peroxidation levels (MDA), Glutathione (GSH) and Catalase

MDA (malondialdehyde), was measured based on the quantitative chemical analysis reaction with thiobarbituric acid (TBA) exploitation photometer (15). GSH level calculable by mixed two.3 cubic centimeter buffer with zero.2ml of the sample and so side zero.5ml of 5,5-dithio-bis-(2-nitrobenzoic acid) (DTNB). The mixture was analyzed by spectrophotometer (16). Catalase was measured by using the procedure of Biovision-USA kits.

Histological study

testis biopsies were soft on 4mm punch and 2% xylocaine was used as an anesthetic. The biopsies were mounted in 10% formalin, habitually processed and embedded in paraffin sections that were stained with hematoxylin and fluorescent dye and examined under the microscope.

Statistical Analysis

the info were analyzed employing an applied math Minitab program. An applied math distinction between the suggests that of the experimental teams was analyzed exploitation a way analysis of variance (ANOVA). Results

Isolation and identification of *Penicillium sp.*

Fungal cultures were isolated from the soil samples collected from varied agricultural lands in Kirkuk city. The fungus isolates were characterized on the premise of colony characteristics and microscopic look (17). Genus *Penicillium sp.* colonies appeared as velvety and fissure with inexperienced color on personal organism medium plates. Reverse aspect of the colony was yellow in color. Results are displayed in Figure 1. Microscopic identification of the plant isolates was performed by LPCB mounting. Genus *Penicillium sp.* appeared as extremely branched mycelium part, septal hyphae. Conidiophores up on the mycelium part and conidiospores were unreal.

Figure 1: Colony morphology of the *Penicillium sp.* isolate

Characterization of silver nanoparticles Color amendment Cell free filtrate of *Penicillium sp.* was mixed with caustic resolution and incubated in dark in rotary shaker. Samples showed modified in color from virtually colourless to brown, this is often a transparent indication of the formation of silver nanoparticles within the reaction mixture. The intensity of the color was accumulated throughout the amount of incubation. The looks of brown color was because of the excitation of surface plasmon vibrations (18).

X-Ray differentiation analysis

The XRD pattern therefore clearly shows that the conductor NO_3 nanoparticles fashioned by the reduction of Ag ions by fungus genus *sp.* are crystalline in nature (Figure 2). Our results similar output was obtained by (19, 20)

Figure (2) XRD of silver nanoparticles mistreatment genus *Penicillium sp.*

Scanning Electron Microscope

The dried silver nanoparticles were obtained by action at 10000 rev for twenty mts. The scale and form of the silver nanoparticles biosynthesized was studied by SEM as in figure 3.

show non-significant changes ($P < 0.05$) compared with management rats as shown in table (1).

Table (1): The levels of MDA, GSH and CAT in testis

Parameters Groups	MDA (mmol/l)	GSH (mol/l)	Cata (mmol/l)
Control group	1.24 ± 0.11 b	0.276 ± 0.043 a	1.16 ± 0.02 a
Second group	2.18 ± 0.37 a	0.139 ± 0.025 b	0.46 ± 0.07 b
Third group	1.38 ± 0.2 b	0.252 ± 0.031 a	1.03 ± 0.04 a
Fourth group	1.27 ± 0.16 b	0.294 ± 0.052 a	1.11 ± 0.03 a

Figure (3)SEM image of silver nanoparticles.

Oxidative stress (MDA) & antioxidant parameters (GSH and catalase) in testis

The levels of MDA (2.18 ± 0.37), GSH (0.139 ± 0.025) and enzyme catalase (0.46 ± 0.07) in second group show high significant changes ($P < 0.05$) compared with management rats (1.24 ± 0.11 ; 0.276 ± 0.043 and 1.16 ± 0.02 respectively). The levels of MDA (1.38 ± 0.2 ; 1.27 ± 0.16 respectively), GSH (0.252 ± 0.031 ; 0.294 ± 0.052 respectively) and catalase (1.03 ± 0.04 ; 1.11 ± 0.03 respectively) in third and fourth groups

Figure (4): testis of control group show spermatogonia (SPG), spermatocytes (SPC) and gamete (SPD). H&E X400.

Histological study

The sections that prepared with control group that show normal in normal structure of spermatogonia, spermatocytes and spermatids as shown in figure (4). The sections that prepared from third and fourth groups show a semi-normal structure spermatogonia, spermatocytes and spermatids as shown in figure (5).

Discussion

The results of present study increased in levels of MDA and decrease in levels of glutathione (GSH) and enzyme catalase in second group that infected with *E. granulosus* With decrease in numbers of spermatogonia and spermatocytes. The results is in agreement with (21) who referred that the infection with *Echinococcus granulosus* lead to elevated the levels of MDA, where found the mean +/- SD of MDA levels of patients with *Echinococcus granulosus*(21). On the other hand, (22) referred that *E. granulosus* lead to decrease in numbers of spermatogonia and spermatocytes that is in agreement with present study (22). About the treatment and the role of AgNPs. many study show the ability of AgNPs as antimicrobial against different bacteria (*S.aureus*, *E.faecalis*, *Pseudomonas* and *E.coli*) (23). The bactericidal activity of nanoparticles is associated with alternative ways by direct react with microbial cells or effect on metabolic process lepton transport from biological process that inhibits respiratory chain enzymes or interferes through covering porousness to phosphate and protons(24). Finally, the present study show after using AgNPs decrease in MDA and increase levels of GSH and catalase suggest the possibility of using Ag NPs as an anti-oxidant agent by inhibition the formation of free radicals and scavenging all species of (ROS) (25).

Characteristics of Lower Back Pain in Pregnant Ladies in Thiqr-Iraq

Ihsan Oudah Yasir¹, Suaad Rodan Shoelef²

Specialist Orthopedic and Trauma Surgeon, National Board F.I.B.M.S Orth., Alhusein teaching hospital – Thiqr, Iraq, ²Specialist obstetrics and Gynecology, national board F.I.B.M.S Gyn&Obs., Bint Alhuda Teaching Hospital Thiqr, Iraq

Abstract

Objectives: to evaluate the frequency of back pain among pregnant female in Thiqr province in Iraq and its demographic characteristics.

Methodology: this is a case series descriptive study of one hundred pregnant female in Thiqr province in Iraq complaining from lower back pain in different stages of their pregnancies. the patients were evaluated firstly by history taking through questioner specially prepared for this study ;as well as; clinical and radiological assessment.

Results: in our study seventy one patients experience back pain in different stages of pregnancy giving a (71%) as frequency of back pain in the studied group. Most of the patients Seventy four patients (74%) developed the pain during the first trimester of pregnancy and (22%) experience the pain during the second trimester. Fifty eight (14) patients (11.96%) gave history of previous back problems before pregnancy; of these; nine patients (7.69%) diagnosed before pregnancy as herniated lumbar disc prolapse and kept on medical treatment and physiotherapy, 2 patients (1.7%) with previous laminectomy surgeries for herniated lumbar disc prolapse, 3 patients (2.56) with diagnosis of degerative spine. One patient underwent cesarean section for sever back pain dueto lumbar disc prolapse at the end of the pregnancy period (non-gynecological indication for cesarean section).

Conclusion: lower back pain is a common problem during pregnancy ,and it shows some common epidemiological characteristics.

Keywords: *Thiqr-Iraq ; back pain ; pregnant ladies*

Introduction

Low back pain is a common complaint among pregnant women. It is estimated that about 50% of pregnant women complain of some form of back pain at some point in pregnancy or during the postpartum period (1).

Pregnancy has a profound effect on the human body, particularly the musculoskeletal system. Hormonal changes cause ligamentous joint laxity, weight gain, and a shift in the center of gravity that leads to lumbar spine hyperlordosis and anterior tilting of the pelvis. In addition, vascular changes may lead to compromised metabolic supply in the low back. The most common musculoskeletal complaints in pregnancy are low back

pain and/or pelvic girdle pain. They can be diagnosed and differentiated from each other by history taking, clinical examination, provocative test maneuvers, and imaging. Management ranges from conservative and pharmacologic measures to surgical treatment. Depending on the situation, and given the unique challenges pregnancy places on the human body and the special consideration that must be given to the fetus, an orthopedic surgeon and the obstetrician may have to develop a plan of care together regarding labor and delivery or when surgical interventions are indicated (2).

Risk factors that contribute to the development of low-back pain during pregnancy have been examined in several studies. The results consistently suggest that the major predictors of back pain during pregnancy are back

pain prior to pregnancy and multiparity.¹ Age, height, weight, race, baby weight, and socioeconomic status do not seem to correlate with risk for development of back pain during pregnancy⁽³⁾.

Two major subtypes of back pain occurs during pregnancy ; (Lumbar and pelvic pain) lumbar pain located at and above the waist in the center of the back. But what is most common is the posterior pelvic pain which 5 times more common than lumbar pain and experience below the waist on either sides⁽⁴⁾.

Usually the treatment is conservative by rest, sleeping on the side, physiotherapy, lifting in proper way without bending, acetaminophen may be sufficient to relieve the pain. But ; the managing doctor should remember the fact that Back pain during pregnancy may be a sign of premature labor or urinary tract infection. Severe back pain during pregnancy lasting more than one week is dangerous sign and need physician consultation⁽⁵⁾.

Patients, material and method

This is case series of One hundred pregnant in Thiqr province in the south of Iraq were studied, all patients were selected randomly from the outpatients clinic of Bint Alhuda teaching hospital during their antenatal care visits and history of back pain were recorded; patients with positive history of lower back pain were evaluated by gynecologist firstly to exclude non-musculoskeletal back pain like preterm labor, urinary tract infection or other rare cause like ectopic pregnancy, such patients were excluded from the study, all patients then were referred to orthopedic out patient in Alhusein teaching hospital and evaluation done by orthopedic surgeon by history taking according to special questioner .clinical musculoskeletal examination of the back done by localizing the site of the pain, straight leg rising test, FABER test for sacroiliac joint pathology, in addition to full neurological examination of the lower limbs. Some patient were sent to x-ray examination for lumbosacral spine and the data from the were collected aiming to study the demographic and epidemiological characteristic of back pain problem in Thiqr province-Iraq.

Results

Our study include 100 pregnant women. 71 patients were found to have back pain giving frequency of (71%) .The mean age of the pregnant woman was 29.4 years. The mean gestational age were 28.3week . 29 patients

(41%) were employer. Thirty nine patients out of 71 patients with back pain (54.92%) were not completed their secondary school. Fifty four patient out of 71 were multipara (76.05) . seventeen patients out of 71 with back pain patient ere primigravida(23.94) .forty one patients of multipara patients experience the same back pain during previous pregnancy(75.92). fifty seven patient out of 71 patient with back pain experienced the pain during second trimester (80.28%). The pain nature was burning sensation in lower back in 49 patients (69.01%). thirty patients with back pain have striae gravidarum in the lower abdomen and flanks (42.25%).

Discussion

Some studies considered back pain during pregnancy is a part of the pregnancy reflecting its common occurrence, Ng BK and his colleagues studied the frequency of back pain during pregnancy and it shows a frequency of 84.6% ; our result is consistent with that study in which a result of 71% indicating that this problem is common during pregnancy in addition to; this study is the one of the few studies which discussed the strong association between the problem of back pain during pregnancy in office worker, our study also shows some association between employment of pregnant female and the problem of back pain (41%)⁽⁶⁾.

In our study 54.92% of pregnant female with back pain didn't completed their secondary education and this result is significantly differs from that of Carvalho MECC in his study which showed only 16.8% only and this difference may be dueto the cultural and educational facilities between our country and European population⁽¹⁾.

Our study show association between multiparity , striae gravidarum and the problem of back pain and this association is well studied by Kokanalı D which showed a an association between presence and severity of striae gravidarum and back pain⁽⁷⁾.

Our study shows that most of pregnant female developed the back pain during second trimester of pregnancy (81.4%) and this finding is not consistent with result of Carvalho MECC in his study who show incidence of back pain during second trimester is only 43.7% a point which need further study and evaluation⁽¹⁾.

Ethical Clearance: The Research Ethical Committee at scientific research by ethical approval of

both environmental and health and higher education and scientific research ministries in Iraq

Thyroid Dysfunction in Iraqi Patients with Acromegaly

Selman Nihad A¹, Rahma Abbas M¹, Ali Atheer Y²

¹College of Medicine, University of Babylon; Babil; Iraq, ²Mustansiriyah University/ National Diabetes Center/Iraq

Abstract

Acromegaly is a chronic endocrine disorder caused by hypersecretion of growth hormone (GH) mostly because of pituitary adenoma. GH induces the formation of Insulin like Growth Factor1 (IGF1) from the liver. Both GH and IGF1 lead to sign and symptom of acromegaly.

Aim: This study designed to identify the prevalence of thyroid dysfunction in Iraqi patients with acromegaly ,to identify the factors responsible for thyroid dysfunction in patients with acromegaly.Is the treatment modalities for acromegaly has a role in thyroid dysfunction?

Study design: A cross sectional case control study

Patients and Method: seventy patients with acromegaly were enrolled from 2 different tertiary centers of endocrinology from Jan. -Dec. 2017 compared with 70 non acromegalic subjects. Their mean age 46 +/-11 years ;forty one (58.5%) males and 29(41.5%)females. Thyroid function test conducted to both patients and control groups including TSH, free T4 and total T3 in both centers. In addition to other variables.

Results: Out of 70 (100%) patients with acromegaly; (51.5%) were euthyroid, (20%) had primary hypothyroidism , (15.7%)had central hypothyroidism and (12.8%) had hyperthyroidism that is significantly higher than normal population ($p<0.001$).Patient with acromegaly had significant systolic and diastolic hypertension vs. control ($p=0.015$,0.004 respectively).Age of the patients, diastolic blood pressure ,first GH and history of hypophysectomy were significant risk factors for thyroid dysfunction ($p=0.02,0.008,0.008$ and 0.02 respectively)

Conclusion : Thyroid dysfunction is more prevalent in patient with acromegaly whether hypothyroidism (both primary and secondary) and hyperthyroidism. The Age and diastolic blood pressure are independent risk factors of thyroid dysfunction. There is significant role of hypophysectomy in thyroid dysfunction development while Sandostatin (Octreotide LAR) treatment had no role.

Key-words: *thyroid dysfunction ,acromegaly ,hypothyroidism ,central hypothyroidism, secondary hypothyroidism, hyperthyroidism.*

Introduction

Acromegaly is a chronic endocrine disorder caused by hypersecretion of growth hormone (GH) mostly because of pituitary adenoma (macroadenoma or less commonly microadenoma) .GH induces the formation of Insulin like Growth Factor1 (IGF1) from the liver [1]. GH and Insulin –like Growth Factor 1(IGF-1) act altogether to induce features of acral and visceral enlargement. Acromegaly is caused by tumors arising from anterior pituitary gland that secreting GH or very rarely by extrapituitary disorders[2]. GH secreted in a

pulsatile fashion, while IGF1 levels are relatively stable with little diurnal variation [3]. It is evident through different studies that IGF1 play an important role in thyroidal cell growth .However it may be responsible for pathogenesis of different thyroid related diseases . One study shows that IGF-1 stimulated synthesis of protein and DNA as well as promoted thyroid cells proliferation and differentiation [4].

The thyroid gland is an endocrine organ present at the front and sides of the neck, anterior to the trachea. The thyroid gland produces thyroid hormones that are

responsible for regulation of metabolism as well as the development and differentiation of different body cells^[5].

Acromegaly and thyroid hormonal abnormalities:

There are different factors responsible for thyroid stimulating hormone (TSH) secretion from anterior pituitary gland. The synthesis and secretion of TSH are under the inhibitory effect of T3 and T4 and stimulatory effect of TRH and to a lesser effect of other factors like leptin, dopamine, GH, IGF1 and somatostatin^[6,7]. The thyroid gland sensitivity to TSH can be modulated by autonomous nervous system^[8].

TSH secretion has an important role for producing basic heat and energy homeostasis maintenance in the body^[9].

Studies show that TSH secretion from thyrotrophic cells can be modulated directly or indirectly by GH and IGF-1^[10]. In thyrotrophic cells; somatostatin inhibits TSH secretion through activation of two somatostatin receptor subtypes, SST2 and SST5^[11]. GH under physiological conditions exerts a negative feedback on somatostatin secretion from hypothalamus and this lead to reduce the growth –hormone releasing hormone (GHRH) secretion^[12]. Thus, the increasing of somatostatin secretion has an impact on thyrotrophic cells that inhibit the TSH secretion. On the other hand, The GHRH has a synergistic effect on the TRH and further on TSH secretion both in healthy subjects and in patients with acromegaly^[13]. As well as an increase in intrapituitary conversion of T3 to T4 in thyrotrophic cells because of GH excess can reduce TSH synthesis and secretion^[14]. Moreover, because of the feedback mechanism, the GH excess with somatostatin participation has an inhibition effect on TSH secretion^[6]. The TSH secretion can also be reduced by the presence of a pituitary tumor per se^[10].

Also, acromegaly can cause panhypopituitarism because of compressing effect of the tumor mass on the surrounding tissue, therefore there may be secondary thyroid or adrenal failure hypogonadism or amenorrhea^[15,16].

Patients and method

This is a cross sectional case control study in which seventy patients with acromegaly were enrolled in this study compared with 70 non-acromegalic subjects from

January 2017- December 2017 from 2 endocrinology specialized centers.

An informed consent have been obtained from all patients and control counterparts, signed and dated before participation in this study.

The enrolled subjects were already diagnosed as acromegaly clinically, biochemically and radiologically.

They fulfill the definition of being acromegalic as their IGF1 exceed the cutoff value for their age and sex, GH level above the reference range and GH fail to drop below 1ng/ml in response to glucose tolerance test. The diagnosis was fortified by detection of pituitary adenoma by MRI either microadenoma (<10mm in diameter) or macroadenoma(>10mm in diameter).

When the GH drop to <1ng/ml and the IGF1 level became within the reference range that is age and sex matched on serial follow up period considered as [inactive]; while those who not met these criteria considered as [active]. The information were written in prepared printed forum including the name, age, sex, height, weight, systolic and diastolic blood pressure, duration of acromegaly, size of tumor (micro or macroadenoma), history of hypophysectomy, radiotherapy or gamma knife, medical therapy (type, dose of somatostatin analogue Long Acting Repeatable (LAR), number of injections) GH level in 1st and last visits, IGF1 in 1st and last visits, disease activity (according to last GH, IGF1 clinical assessment), history of smoking, and family history of thyroid disease.

Thyroid function tests were requested (TSH (reference range 0.4-4.2 mIU/L), free T4(reference range of kit 0.7-1.9 ng/dl) and total T3(80-180ng/dl)[measured by electrochemiluminescence immunoassay]. GH level (obtained from the registered data at first and last visit (by chemiluminescent immunoassay)) and IGF1 level (according to sex and age matched limits) (also from the registered data at first and last visit (measured by immunochemiluminometric assay (ICMA)))

Continuous variables were expressed by mean +/-SD while categorical variables as percentage, all these collected data and variables analyzed by using crosstab chi square test for categorical variables or Student's paired t-test for continuous variable and ANOVA test between categorical and continuous variables. The value of <0.05 considered as statistically significant.

Results

The subjects of this study were 70 patients with acromegaly with a mean age 46 +/-11 years .Forty one (58.5%) males and 29(41.5%)females disease duration from time of diagnosis differ with a range from 1year -30years (average 8+/-6). A growth hormone producing macroadenoma was the cause of acromegaly in 62 patients (88.5%) and in the remaining 8(11.5%) had microadenoma .Thirty six (51.4%) underwent neurosurgical treatment in form of hypophysectomy; 2 of them underwent hypophysectomy twice and another 2 underwent hypophysectomy thrice .Six patients (8.5%) exposed to gamma knife and another one to conventional radiotherapy. All of our patients (even who had history of hypophysectomy or gamma knife after the intervention if they didn't achieve a remission immediately) received medical treatment in form of

monthly Octreotide (Sandostatin LAR) injection). Hypophysectomy, radiotherapy and/or medical therapy for acromegaly induced a significant reduction of mean GH and IGF-1 levels (27.83 +/- 25.69 vs. 4.73 +/- 6.72 ng/ml, $p < 0.001$ and 772.15 +/- 521.9 vs. 404.2 +/- 278.6 ng/ml, $p < 0.001$ respectively) that is shown in figure (1), but both GH and IGF-1 values normalized only in 12 (17.2%) at time of collecting the data(5 of them had a remission after surgery and medical treatment , 2 patients had remission after both surgery and gamma knife, one had remission after gamma knife and medical treatment, and 4 patients had remission after medical treatment only) ;while the remainder 58(82.8%) had active disease (including those with partial response ;those who had elevated IGF1 with normal GH or those with elevated GH with normal IGF1).

Figure (1) the comparison between the mean first and last result of both GH and IGF1.

The mean basal GH at time of diagnosis was (27.83+/-25.7) and the mean last GH was (4.73+/-6.72) with a percent of reduction were (65.2%). While the mean basal IGF1 was (772.15+/-522) and the mean last IGF1 was (404.26+/-278.62) with a percent of reduction were (35.9%). Twenty eight (40%) of patients were hypertensive, 13(18.5%) were smoker.

Family history revealed thyroid disease or goiter in 17(24.2%).

The control group was composed of 70 non-acromegalic subjects (50% males) with a mean age of 43.54+/-7.17 years.

* Cross tabulation Chi-square test

† ANOVA test

Table 1 shows the clinical and analytical characteristics between patients with acromegaly and control groups. The systolic blood pressure was higher in patients with acromegaly compared to control subjects (132.55+/-23.73 vs. 123.64+/-18.19 respectively P =0.015). The diastolic blood pressure was also higher in patients with acromegaly compared to control subjects (86.64+/-17.1 vs. 79.07+/-14.2 respectively P=0.004). There is significant thyroid dysfunction in patients with acromegaly compared to control subjects (p value <0.001). As well as there is significant differences in mean TSH, free T4 ,total T3 of patients with acromegaly compared to control subjects (with P value <0.001, 0.028, 0.027 respectively)

In table 2 the acromegalic patients were subdivided into 4 main group according to their thyroid function into euthyroid 36(51.5%), hyperthyroidism 9(12.8%), primary hypothyroidism 14(20%) and central hypothyroidism 11(15.7%).Then the analysis of variance in between subgroups conducted to identify the differences in variables of general clinical characteristics which shows that the age is significant risk factor (p=0.02) and the diastolic blood pressure also significantly different between subgroups (p=0.008).

In table 3 the analysis of variance conducted to the subgroups of patients with acromegaly that were already classify according to their thyroid status to identify the

differences of specific acromegalic characteristics of variables which shows the significance of basal growth hormone level at time of diagnosis as well as the history of neurosurgical treatment (hypophysectomy) on the thyroid status ($p=0.008$, 0.02 respectively). There is no significant correlations between thyroid status from one side and pituitary adenoma size, activity of disease ,duration of disease ,history of radiotherapy treatment, last GH and basal or last IGF1 on the other side.

Discussion

Most of our patients with acromegaly were in euthyroid status (51%) while there is 20% had primary hypothyroidism, in addition to 15.7% had central (secondary) hypothyroidism and only 12.8 %had hyperthyroidism; these findings are accepted if it is compared with Cannavo S. et al study that show the approximate levels of euthyroidism of about (67%) and about 25% have hypothyroidism [17]. As well as we can accept our result regarding hyperthyroidism if we compared it with other study that found in 3.5–26% of patients with acromegaly in previous studies [18]. Thyrotoxicosis is not frequent [18], but it increases cardiovascular risk, particularly when is coupled with high GH and IGF-1 levels, and for that reason it is important to gain euthyroidism as fast as possible. Hyperthyroidism should be taken into consideration in diagnosing a patient with acromegaly and weight loss, after excluding cancer [19].

Lastly we fail to found relationships between thyroid dysfunction from one side and duration of disease , last GH, first or last IGF1 on the other side which are similar to what is found in other studies like Cannavo et al [17].

Conclusion

Thyroid dysfunction is more prevalent in patient with acromegaly whether hypothyroidism (both primary and secondary) and hyperthyroidism. The Age and diastolic blood pressure are significant risk factors of thyroid dysfunction. There is significant role of hypophysectomy in thyroid dysfunction development while Sandostatin (Octreotide LAR) treatment had no role.

Simulation of Poly (ADP-ribose) polymerase (PARP) Enzyme with BAI Compound in the for Thyroid Cells

Hasan Tuhmaz Hamd

Thi-Qar University, College of Medicine, Nasiriyah, Thi-Qar, Iraq

Abstract

In this study, the simulation for the preparation of pharmacological compound anti-cancer Baicalein (6,7-dihydroxy-2-phenyl-4H-chromen-4-one). These compounds have an importance of the known biologic and its wide medical requests. Our theoretical results dedicated to simulating that acquired for researchers (SE EUN HAN et. al) Practically against cancerous cells in the thyroid gland and matching them through a program (MOE) theoretically. From the illustrious effects, the compound (BAI) is behaving as a good legend when it interacted with amino acid for the enzyme (PARP).

Key words: *Docking, BAI, anticancer, FOR Thyroid cells*

Introduction

Flavonoids contain of a large set of polyphenolic compounds consuming a benzo- γ -pyrone configuration and are ubiquitously current in plants. They are synthesized by phenylpropanoid alleyway. Obtainable reports be likely to show that subordinate metabolites of phenolic environment counting flavonoids are responsible for the variety of pharmacological activities [1, 2]. Flavonoids are hydroxylated phenolic substances and are known to be combined by plants in reaction to microbial infection [3]. Their activities are structure reliant on. The chemical nature of flavonoids be contingent on their structural course, degree of hydroxylation, other substitutions and conjugations, and degree of polymerization [4]. Topical interest in these substances has been motivated by the thinkable health assistances rising from the antioxidant actions of these polyphenolic compounds. Purposeful hydroxyl groups in flavonoids arbitrate their antioxidant effects by scavenging free radicals by chelating metal ions [5, 6]. The chelation of metals be able to vital in the avoidance of radical generation which damage impartial bio-molecules [7, 8]. As a dietary component, flavonoids are supposed to have health-stimulating properties due to their great antioxidant capacity both in vivo and in vitro systems [9, 10]. Flavonoids have capability to induce human protective enzyme organisms. The number of trainings has suggested protective effects of flavonoids in contradiction of frequent infectious (bacterial and biological diseases) and degenerative

infections such as cardiovascular diseases, cancers, and further age-amalgamated diseases [2, 9, 10]. The mechanisms tangled in safety providing by flavonoids are termed separately. Flavonoids also performance as a secondary antioxidant defense system in plant tissues showing to different abiotic and biotic stresses. Flavonoids are situated in the nucleus of mesophyll cells and within centers of ROS generation. They also regulate growth factors in plants such as auxin [11]. Bio-synthetic genes have been accumulated in several bacteria and mushrooms for improved creation of flavonoids [12]. Flavonoids are a set of natural compounds with variable phenolic assemblies and are established in plants. In 1930 a novel substance was quarantined from oranges. At that time, it was supposed to be a member of a new class of vitamins and was selected as vitamin P. Advanced on it converted clear that this substance was a flavonoid (ruin) and till now more than 4000 varieties of flavonoids have been identified [13]. The poly (ADP-ribose) polymerases (PARPs) are an emerging family of enzymes that share the ability to catalyze the transfer of ADP-ribose to target proteins (poly ADP-ribosylation) [14,15]. There are at least 18 members of the PARP family that are encoded by different genes, and stake homology in a preserved catalytic domain.1 Although some isoforms containing PARP1 and PARP2 are finest known for their involvement in DNA reparation routes, it is now clear that these and other PARPs have an important role in several cellular processes including cell proliferation and cell death. A number of cellular

substrates for PARP have been well-defined, and a mainstream of these proteins are nuclear proteins that are complicated in nucleic acid metabolism, modulation of chromatin structure, DNA synthesis, and DNA restoration. PARP also auto transforms itself in the appearance of DNA filament breakdowns, and is one of the chief acceptors of poly ADP ribose in vivo. PARP1 is the first and best described member of the PARP family. PARP2 is supreme cautiously related to PARP1 with 69% match in its catalytic domain, and was predictable on the foundation of the perseverance of PARP activity in PARP1 deficient cells [14,16]. Thyroid tumors are present broadly classified as follicle-derived (thyroid epithelial) neoplasms, other epithelial tumors, non-epithelial tumors and secondary tumors assembled on pathological, clinical and genetic characteristics [17, 18]. These tumors can be benevolent, borderline or malignant, focus on their biological performance within the body. The follicular adenoma, hyalinizing trabecular tumor, encapsulated follicular-patterned thyroid tumors, papillary thyroid carcinoma (PTC), follicular thyroid carcinoma, Hürthle cell tumour, poorly differentiated thyroid carcinoma, anaplastic thyroid carcinoma and squamous cell carcinoma comprise the major thyroid epithelial neoplasms. Some of the other epithelial tumors found in the thyroid gland have medullary carcinoma, salivary gland-type tumors, mucinous carcinoma and thymic tumors, at the same time as tumors like paraganglioma, peripheral nerve sheath, vascular, smooth muscle, solitary fibrous and histiocytic tumors, lymphoma and teratoma fall under the non-epithelial tumors of the thyroid [16-19]. The well separated thyroid cancer such as follicular and papillary carcinomas description for 95% of all thyroid cancer cases and are regularly interrelated with a good prognosis and existence rate when detected early [19]. On the other hand, the injured or undistinguishable anaplastic thyroid carcinoma, albeit a rare cancer, is nearly continually fatal [18].

Materials and Method

These compound are generally used in pharmaceuticals and their effectiveness has been measured against cancer by advanced programs (MOE).

A-MOE program 2015.

Docking study Ligand: In the field of molecular forming, docking is a method which expects the preferred orientation of one molecule to a second when bound to

each other to form a stable complex. Molecular Network software packages provide Chem 3D, which was used for the generation of 3D coordinates from. Again, using Converter of these same server 2D structures of the drugs was converted into PDB format which is an acceptable form for any standard docking software. Finally using MOE were prepared by the addition of hydrogen atoms. Structures.

C- 4-(4-carbamoyl-1-methyl-3-oxoisindolin-2-yl)-1- C-cyclohexylpiperidinium.

D- PARP poly (ADP-ribose) polymerases.

Results and Discussion

Docking Analysis, the docking scores were obtained from (Baicalein (6,7-dihydroxy-2-phenyl-4H-chromen-4-one) with against (PARP) receptor. The output of all ligands was given by energy values in kcal/mol as shown in Table 1. Some ligands show good docking scores when compared to standard drug. Docking score of the compounds targeted was compared with the score of the drug Baicalein (6,7-dihydroxy-2-phenyl-4H-chromen-4-one) which is used as a potent drug for the treatment of tumor show higher docking scores in comparison with standard drug. The interactions were stronger for all the ligands which are used for docking simulation table (1-3) Validation of Ligands. The results showed in Tables (1) and (2) that the best correlation with protein and separated from Thyroid cancer was that the strongest correlation of the first compound with amino acidity was found to be strongly linked with the amino acid (GLY 863) was associated with the functional group (hydroxide) H-donor And H-acceptor of protein amino acids as shown in Figures ((1-8)) and the second amino acid is (SER 904) associated with the functional group

(hydroxide) acceptor

Conclusion

We have computer-generated compound from the former researchers (SEUN HAN et. el) with Baicalein (6,7-dihydroxy-2-phenyl-4H-chromen-4-one) compound. Bendable docking of ligand to receptor molecules is an emerging method and is extensively used to reduce cost and time in drug innovation.

From the results, a process was showed to detect the strength of the link between the compound and the enzyme using the program (MOE), from the previous literature that showed efficacy as anti-fungal and some bacteria and the effect of these compound on thyroid cells cancer and inhibition of the causative enzyme (PARP)

Thus, this study showed that the compound (1) takes the best formula of is alignment more the association with the link with amino acids (GLY 836and SER 904) and gives the best consequences, thus clarifying the best inhibitor of the association with the enzyme.

Advantage of Application of Topical Hyaluronic Acid in Reducing Post Tonsillectomy Pain; Cross Sectional Comparative Study

Ahmed Kareem Shiaan Al-Baidhani¹, Muthanna Saleem Abdulameer²

¹F.I.C.M.S (Otolaryngology)-Al-Sadiq Teaching General Hospital/Iraq, ²F.A.B.H.S (Otolaryngology), Lecturer, Hammurabi College of Medicine, University of Babylon/Iraq, ³Consultant Otolaryngology/Al-Sadiq Teaching General Hospital/Iraq

Abstract

Introduction: Tonsillectomy is common surgical operation performed in otolaryngology department. Various techniques could be used that include traditional cold dissection, powered instrumentation like electro cautery, harmonic scalpel, laser, and radiofrequency technique. As with any surgery, there are some risks can occur with tonsillectomy, these includes bleeding, pain at the site of surgery and/or referred otalgia, and infection. The aim of our study was to assess the postoperative use of topical hyaluronic acid with regards to safety, pain relief. **Method:** The research was considered a cross-sectional research made on 60 patients needing tonsillectomy from a period began from January to September 2018. The patients had been separated into two groups both from 30 patients, one group (group A) treated by using high molecular weight(HMW) Hyaluronic acid spray on tonsillar beds after operations , and the second group(group B) dealt as control. Early complications were registered in questionnaires and then the data were evaluated for each group. **Results:** The use of high molecular weight (HMW) Hyaluronic acid spray on tonsillar beds after surgery has reduces the pain significantly after 3 – 7 days (p-value = 0.0001) while has no implication on pain reduction within 12 - 24 hours p-value (0.17 and 0.3) respectively . **Conclusion:** The use of (HMW) hyaluronic acid spray can be used safely in post tonsillectomy patients. Hyaluronic acid spray can minimize post tonsillectomy pain.

Keywords: High molecular weight (HMW) hyaluronic acid (H.A.), tonsillectomy, pain

Introduction

The history of surgical removal of tonsils has been returned back to three thousand years ago¹, nowadays, Tonsillectomy is usual operation almost lead to open wound, so, connected with important postoperative pain that may last as long as 2 to 3 weeks period 2–5. This pain constitutes the major morbidity factor leading to poor nutrition, dysphagia, dehydration and delaying time for returning to work or school^{6,7}. Many factors contributes to the post-tonsillectomy pain as mucosal damage, irritation of vagal , glossopharyngeal nerves ,tissue inflammation ,retained debris and spasm of the muscles of the pharynx ^{5,8,9}.

Nonsteroidal anti-inflammatory drugs, codeine and paracetamol are frequently used to minimize the pain occurs following tonsillectomy ^{10,11}.Opioids are

associated with respiratory depression ,nausea, vomiting, depression of cough reflex and sedation^{5,10,12}. So, more safe opioid and non-opioid analgesia are used as pain killer to alleviate pain and discomfort after removal of the tonsils. Ibuprofen now suggested by American Academy of Otolaryngology— Head and Neck Surgery for pain relief following tonsillectomy ^{4,8,13}.

Optimal pain relief after tonsillectomy is challenging .Many researchers use different options for pain reduction whether systemic or topical like bupivacaine ^{14,15}, dexamethasone , lignocaine¹⁵ , sucralfate ¹⁶, etc.

Hyaluronic acid is high molecular weights, hydrophilic glycosaminoglycan that is a naturally component of connective tissue particularly seen in the synovial fluid of joint and inside the extracellular matrix of skin ^{17–19}. It provides a role in wound healing where

its secretion in proliferative phase stimulates fibroblast migration and proliferation 20,21. Finally it shows a suppressive effect on inflammatory mediators, tissue reactions to trauma so could be applied safely as an anti-inflammatory factor 21,22. Hyaluronic acid is a lubricant material with ability to stimulate growth so widely used to be the normally non-immunogenic, biocompatible and anti-inflammatory dressing biomaterial 22. Hyaluronic acid is reported to decrease pain, inflammation with stimulation of wound healing in pressure ulcers 19. It has a role in management of osteoarthritis and tendon problems 17, in burns, and chronic wounds 23,24 as well as in healing of vocal fold wounds 25.

Materials and Method

A cross-sectional study carried out on 60 patients requiring tonsillectomy throughout the period began from January to September 2018. The study certified by hospital ethical committee with written informed consent was taken. The indications of surgery are recurrent attacks of acute tonsillitis, chronic tonsillitis and/or large obstructive tonsil with sleep apnea syndrome. Patients with quinsy, associated adenoiditis or adenoid hypertrophy, tonsillectomy for biopsy were excluded. Our study population was arising from those attended to Al-Sadiq teaching general hospital in Hilla city, Babylon, Iraq. The tonsillectomies have been done under general anesthesia, with placement of oral endotracheal intubation. The tonsils were removed by cold steel dissection method and hemostasis by ligatures, packs or cautery. The study sample were divided into 2 groups each from 30 patients, first group (group A) dealt with postoperative use of high molecular weight (HMW) Hyaluronic acid spray (0.01% topical spray) on tonsillar beds three to five times per day starting 3 hours postoperatively and the second group (group B) considered as a control. Pain assessment was done 12 hours, 24 hours, 3 days and 7 days post tonsillectomy using visual analogue scale from 0-10 (0 represents no pain at all, 10 represents the severe incapacitating pain). Data collected were comprised of age, gender, all data collected for both groups were analyzed by SPSS 22 used Mann - Whitney test for calculate P-value and another statistical analysis.

Results

In our study we take 60 patients all undergone tonsillectomy, 30 patients were used H.A. after tonsillectomy as a (case) and 30 patients not used H.A.

as a (control). 38(63.33%) of patients were female and 22(36.67%) were male as in figure 1.

Figure1: gender distribution

Figure 2 shows gender distribution according to the type of sample.

Table 1 shows that the two groups (case and control) are similar regarding the age (p value > 0.05)

Table 1: Mean age of the study sample

	Case Mean ±SD	Control Mean ±SD	Z- test	P value
Age (years)	18.7 ± 3.6	18.9 ± 3	0.3	0.53

Z: Man-Whitney test; P- value <0.05 =significant.

Gender Chi square = 0.3 with P-value= 0.79 no difference between gender in case and control sample.

Figure 2: gender distribution according to type of sample

Table 2 shows that there is no difference in pain score at 12 hours and 24 hours postoperatively after using H.A. between the case and control group (p - value 0.17 and 0.3) respectively. However the use of H.A. spray post tonsillectomy in case group results in significant decrease in pain after 3 days and 7 days postoperatively (p value <0.05).

Table 2: Pain assessment by visual analogue scale post operatively

Time	Case Mean ±SD	Control Mean ±SD	Z- test	P-value
After 12 hours	7.20±1	7.60±1.1	1.37	0.17
After 24 hours	7.13±1	7.40±1.2	1.078	0.3
After 3 days	4.60±1.2	6.60±1.7	4.491	0.0001**
After 7 days	2.47±1.3	4.07±1.34	4.071	0.0001**

Z: Man-Whitney test; P- value <0.05 =significant.

Discussion

Pain management after tonsillectomy is a crucial factor in decreasing postoperative morbidity and complications like poor oral intake, dehydration, dysphagia and disturbed sleep 10,11,26. The pain and inflammatory reactions following oral surgery may reach its maximum level two days postoperatively and decrease through 7-10 days 27

Hyaluronic acid is a linear polysaccharide found in many tissues especially connective tissues where its responsible for tissue elasticity ,control of hydration of connective tissues and synovial fluid elastoviscosity .It

is an important factor in the process of wound healing 28,29. In our study it was found that postoperative pain following tonsillectomy was dramatically reduced by using topical (HMW) Hyaluronic acid spray especially after 3 days. This may be explained by the fact that this substance has a role in repairing tissue and cover the exposed wound of tonsillectomy as well as its minimize the risk of post tonsillectomy infection .These effects were clearly described to induce healing for pressure ulcers and to increase the rate of healing in diabetic foot30. Hyaluronic acid also has anti-inflammatory effects; decreasing leukocyte infiltration and enhance the angiogenesis31. H.A. is effective in management of osteoarthritis pain17 and pain of temporomandibular joint disorder18, where it used for intra articular

injection²¹. Researchers from turkey studied the effect of applying hyaluronic acid gel during tonsillectomy and found that the pain decrease significantly postoperatively with rapid wound healing. In our study the maximum benefit from applying the H.A. spray was between 3-7 days (p value <0.05) while no significant pain reduction was observed within 24 hours postoperatively. This may indicate that immediate effect of H.A. need time to act as anti-inflammatory, coating material and stimulatory for wound healing.

Several studies test the effect of hyaluronic acid following teeth extraction especially third molar teeth and found significant pain reduction with decrease in analgesics need ^{32,33}. Little researches studied the effect of hyaluronic acid following tonsillectomy so researchers should be encouraged to explore its effects, adverse effects with a larger study samples.

Conclusion

The use of topical (HMW) Hyaluronic acid spray is recommended post tonsillectomy to decrease post tonsillectomy pain and decrease the need for analgesia. Its shows maximum effect after 3 days postoperatively which may help to speed recovery, decrease morbidity and ensure early return to school and work.

Atherogenic Index of Plasma among Type2 Diabetic Patients Cross-Sectional Study In Iraq

Dalal Abd Al-Sattar Asaad¹, Ali Shalash Sultan¹, Zaid Naji Hassan¹

¹Biology Department, College of Science-Mustansiriyah University/Iraq

Abstract

The study was carried out on (60) males previously diagnosed with diabetes mellitus type2 aged (40-55) years with mean \pm SE of age (48.46 \pm 5.03), who visited the Specialist Center for Endocrine and Diabetes at Baghdad province. The total cholesterol(TC) mg/dl levels were (180.90 \pm 11.68 ,209.60 \pm 14.50 ,203.10 \pm 14.65) respectively showed non significant ($p > 0.05$) variation in diabetic groups ,TG mg/dl levels in normal weight group (172.55 \pm 14.13) decreased significantly ($p < 0.01$) in comparison with over weight and obese (273.95 \pm 22.83) ;(306.95 \pm 25.20) ,respectively. LDL mg/dl levels were (101.50 \pm 9.56; 110.00 \pm 12.71; 105.40 \pm 9.99) respectively showed non significant ($p > 0.05$) variation in diabetic groups. VLDL mg/dl in normal weight group (35.75 \pm 3.31) decreased significantly ($p < 0.01$) in comparison with over weight and obese (59.70 \pm 4.59); (61.30 \pm 5.03).HDL mg/dl levels were (43.20 \pm 2.01 ,42.85 \pm 3.05,40.05 \pm 3.32) respectively showed non significant ($p > 0.05$) variation in diabetic groups. FBG showed non-significant correlation with TC($r = -0.13$),LDL($r = -0.13$),TG ($r = -0.12$),VLDL($r = -0.15$),HDL($r = 0.24$). HbA1C showed positive significant ($p < 0.05$) correlation with TC($r = 0.25$), while showed non significant correlation with TG ($r = 0.10$),LDL ($r = 0.18$),VLDL ($r = -0.01$), HDL ($r = 0.16$).BMI showed non-significant with TC($r = 0.15$),LDL($r = 0.08$),HDL, ($r = -0.08$).While positive significant ($p < 0.01$) , correlation with TG ($r = 0.50$), VLDL($r = 0.39$). The levels of AIP differ significantly ($p < 0.01$) among diabetic groups (0.576 \pm 0.04; 0.800 \pm 0.06 and 0.911 \pm 0.05) but over weight and obese(0.800 \pm 0.06 ; 0.911 \pm 0.05) were not significant ($p > 0.05$). AIP was significantly correlated with body mass index($r = 0.25$), visceral fat ($r = 0.37$), TC ($r = 0.22$), LDL ($r = 0.24$), HDL ($r = -0.72$), TG ($r = 0.84$), glucose ($r = 0.32$). Positive correlation ($P < 0.01$) with BMI($r = 0.36$) ;VLDL ($r = 0.28$)($p < 0.05$) and negative correlation ($p < 0.01$) with HDL-C ($r = -0.32$)was seen .

Keywords:- Diabetes mellitus ,Dyslipidemia,lipid profile,Atherogenic index of plasma(AIP).Insulin resistance(IR).

Introduction

Dyslipidemia in T2DM is characterized by high level Of total cholestrol (TC), low density lipoprotein (LDL-C) ,triglyceride (TG) with low level of (HDL-C)¹.The early detection of lipid abnormalities with their treatment can reduce the risk of atherogenic cardiovascular and cerebrovascular disorders in T2DM patients².Atherosclerotic coronary artery disease and different form of cardiovascular disease (CVA) are the principle causing of morbidity and mortality in T2DM, that alterations in lipid profile lead to atherosclerosis in T2DM³.The deffintion of atherogenic index of plasma AIP is used logarithm(log) of the ratio of plasma concentration of TG/HDL-C. Which was correlated with size of HDL and LDL molcules⁴. The AIP is regarded as astrong marker for plasma atherogenicity

and correlated with (CVD) .The AIP value under 0.11 is associated with low risk of CVD but value between 0.11-0.21 and above than 0.21 causes intermediate and elevated risk respectively⁵. Diabetes (T2DM) and related cardiovascular complication are major public health challenges among world wide. Individuals with T2DM have two to four fold risk of coronary artery disease (CAD) causing death among people of Type2Diabetes mellitus⁶. Dyslipidemia participates in causing of atherosclerosis ,which pathological affects of CVD persons with metabolic syndrome or T2DM exhibit a characterstics pattern of serum lipid abnormalities ,consisting of low HDL-C and increased TG levels with increased LDL particles⁷.Various mechanisms forming the atherogenic lipid disorders in Type2 patients. The increase in breakdown of

intracellular Triglycerides and release of Free fatty acids increased into the blood causing free fatty acids hepatic infiltration, muscle, pancreatic B-cell, predisposing to T2DM. Increased hepatic FFAS contribute to elevation of hepatic TG with subsequently resulting in increased VLDL particles. From other side cholesterol ester transfer protein (CETP) converts Triglycerides from Very low density lipoprotein to cholesterol found in HDL and LDL resulting to cholesterol rich atherogenic VLDL particles. HDL particles that undergo these modifications are cleared by the renal function, resulting in decreased HDL-C levels⁸. Endothelial dysfunction (ED) is another major factor for the development of atherosclerosis. It might be caused by dyslipidemia, oxidative stress, inflammation, lipid abnormality regard the major cause of ED, especially LDL particles are more susceptible to oxidation, oxidized LDL particles reduce the availability of nitric oxide (NO) and impair endothelial function. This creates a positive feedback loop in which inflammatory factors promote monocyte and T cell adhesion, foam cell formation, extracellular matrix digestion and vascular smooth muscle migration and proliferation leading to atherosclerosis⁹. The prostacyclin and Nitric oxide production by normal endothelial inhibition with platelet reactivation and relaxation vascular smooth muscle improving circulation normally. Diabetic patients showed reduction in release of prostacyclin and Nitric oxide with chronic defects of endothelial Nitric oxide synthesis action, which is a predictor of dyslipidemia and explain partly the accelerated atherosclerosis in DM¹⁰. In diabetes long term hyperglycemia causes generalized vascular endothelial damage which reduced function of lipoprotein lipase leading to increase TG, TC, and LDL¹¹.

Material and Method

Collection of Information and Patients Selection

The study was carried out on (60) males previously diagnosed with diabetes mellitus type 2 aged (40-55) years with mean \pm SE of age (48.46 \pm 5.03), who visited the Specialist Center for Endocrine and Diabetes at Baghdad province. The study was begun from 1/ November 2018 to 30/January 2019. Informed consent was obtained from patients cross sectional study to fill the questionnaire form them before venipuncture which was used for recording the necessary information that concerning with subject groups which included name, age, length, body weight, and duration of diabetes onset.

Study design:-

The subject study included group (60) patients as diabetic group (cross sectional study). The diabetic group was divided into three subgroups according to BMI

Normal weight BMI (18.5-24.9) Kg/m².

Over weight (OV) BMI (25-29.9) Kg/m².

Obese BMI (\leq 30) Kg/m².

2-Collection of blood samples:-

Eight milliliters of blood were drawn from each patient after (12- 14) hours fasting via venipuncture, by using 10 ml disposable syringes between (8.00 –10.30 A.M). Blood specimen used in two aliquots; two and three ml. The first one was put in a tube have ethylene diamine tetra acetic acid (EDTA K3) as anticoagulant and stored at (2-8°C) for analyses of HbA1c, while the second aliquot was transferred into gel tubes without anti-coagulant; blood was left to clot for 20-30 minutes at (37°C) in an incubator. Serum were separated by centrifugation at 3000 rpm for 10 minutes used for the determination of FBG, lipids profile, serum was stored in Eppendorf tubes at (-20°C) for analyses later.

Lipid profile calculation:-

Measurement of serum total cholesterol (TC) Cholesterol was determined by using the Mindray Bs-200¹². Measurement of Triglycerides (TG) Concentration. Triglyceride was determined by using the Kit SPINREACT according to the method by mindray¹². Measurement of Serum High Density Lipoprotein (HDL) Concentration. MINDRAY BS-120 / 200E Autoanalyzer use SPINREACT kit¹³. Measurement of Low Density Lipoprotein (LDL). Mindray BS-120 / 200E Autoanalyzer use SPINREACT kit¹³. VLDL(mg/dl)=

Atherogenic index of plasma was measured using base 10 logarithm of the ratio Triglycerides to HDL, formula = $\log(TG/HDL-C)$. (Dobiášová and Frohlich, 2001). **AIP =Log.**

Results and Discussion

Table (1) Effect of different groups of diabetic subjects in lipid profile.(Mean ± SE)

Parameters (mg/dl)	Groups			LSD value
	Normal weight	Over weight	Obese	
Total cholesterol	180.90 ± 11.68 a	209.60 ± 14.50 a	203.10 ± 14.65 a	38.747 NS
Triglyceride	172.55 ± 14.13 b	273.95 ± 22.83 a	306.95 ± 25.20 a	60.221 **
LDL	101.50 ± 9.56 a	110.00 ± 12.71 a	105.40 ± 9.99 a	30.722 NS
VLDL	35.75 ± 3.31 b	59.70 ± 4.59 a	61.30 ± 5.03 a	12.390 **
HDL	43.20 ± 2.01 a	42.85 ± 3.05 a	40.05 ± 3.32 a	8.081 NS

** (P<0.01), NS: Non-Significant.
Means having with the different letters in same row differed significantly

From the result table (1), the TC mg/dl levels were (180.90±11.68, 209.60±14.50, 203.10±14.65) respectively showed non significant (p>0.05) variation in diabetic groups. TG mg/dl levels in normal weight group (172.55±14.13) decreased significantly (p<0.01) in comparison with over weight and obese (273.95±22.83); (306.95±25.20) respectively. LDL mg/dl levels were

(101.50±9.56; 110.00±12.71; 105.40±9.99) respectively showed non significant (p>0.05) variation in diabetic groups. VLDL mg/dl in normal weight group (35.75±3.31) decreased significantly (p<0.01) in comparison with over weight and obese (59.70±4.59); (61.30±5.03). HDL mg/dl levels were (43.20±2.01, 42.85±3.05, 40.05±3.32) respectively showed non significant (p>0.05) variation in diabetic groups.

Table (2) Correlation coefficient between lipid profile with FBG,

HbA1c and BMI in diabetic patients.

Parameters	Correlation coefficient-r		
	FBG	HbA1c	BMI
Total cholesterol	-0.13 NS	0.25 *	0.15 NS
Triglyceride	-0.12 NS	0.10 NS	0.50 **
LDL	-0.13 NS	0.18 NS	0.08 NS
VLDL	-0.15 NS	-0.01 NS	0.39 **
HDL	0.24 NS	0.16 NS	-0.08 NS

* (P<0.05), ** (P<0.01), NS: Non-Significant.

From the result table (2), FBG showed non-significant link with TC (r=-0.13), LDL (r=-0.13), TG (r=-0.12), VLDL (r=-0.15), HDL (r=0.24). HbA1c showed positive significantly (p<0.05) correlated with TC (r=

0.25), and showed non significant correlation with TG (r=0.10), LDL (r=0.18), VLDL (r=-0.01), HDL (r=0.16). BMI showed non-significant with TC (r=0.15), LDL (r=0.08), HDL (r=-0.08). positive significantly (p<0.01)

correlated with TG (r=0.50) ,VLDL(r=0.39). The dyslipidemia means to change in lipid profile involving elevating serum TC , TG, decreased HDL, elevation LDL and VLDL. Dyslipidemia is present to be accompany with both, insulin resistance and coronary heart disease⁸. Studies lipids profile in T2DM and control subjects in overweight and obese groups in Saudi Arabia was seen high incidence of dyslipidemia in T2DM patients (Our results showed non significant increase of TC in overweight and obese diabetic patient >200mg and significantly higher TG and VLDL levels; while LDL and HDL levels were non-significant this attributed to that excess acetyl CoA from lipolysis of fat to free fatty acids (FFA) gets converted to more and more cholesterol and its concentration in blood rises in T2DM.VLDL increased either because of increased hepatic production of VLDL or decreased removal of VLDL circulation. Serum concentration of TG also increases because of decreased removal from circulation.The increased TG in our study was agreed with (Taskinen,2003). who reported the increased serum TG levels in T2DM patients are widely because of an elevation VLDL, specially large VLDL1 molecules.Both rising production and late catabolism of VLDL are responsible for the rising VLDL.Insulin resistance is accompanied with reduction activity of hormone-sensitive lipase in adipose tissue by insulin, resulting lipolysis increasing and, portal flux of NEFA to hepatic cells to stimulate synthesis of TG in hepatic cellsThe role of increasing in TG levels in hyperglycemic patients also includes decrease of lipoprotein lipase (LPL) activity. It has been recorded that LPL activity is reduced in patients with T2DM.(Nikkila and Taskinen,1981).LPL hydrolyses TG of chylomicrons and (VLDL). The FFA flux into glycogen rich hepatocytes stimulates TG synthesis, which produced of VLDL-cholesterol..Obesity and T2DM are accompanied by elevation deposition of TG in non-adipose tissue, like heart, liver, pancreas, and skeletal muscle. Obesity, fat accumulated in the under skin, abdominal and visceral depots, which is have affinity in risk of metabolic and heart blood vessels complications; Obesity is positively affecting risk the developing of T2DM,dyslipidemia, IR and hypertensive. It characterized by adipose tissue defects growth resulting in increasing size of fat cell (hypertrophic obesity) or fat cell number (hyperplastic obesity), or both. Obesity is known as body mass index (BMI). As we observed mean serum TG levels higher in diabetics groups .As BMI showed high significant correlation with TG(r=0.50) and VLDL (r=0.39). Higher HbA1c

concentrations in our study were associated significantly correlation with higher TC(r=0.25) (P<0.05 reported that significant linear positive correlation with HbA1c and lipid parameters except HDL in T2DM group.

Table (3) Effect of different groups in Atherogenic index of plasma

(AIP) in diabetic patients.

Groups	Mean ± SE of AIP
Normal weight	0.576 ± 0.04 b
Over weight	0.800 ± 0.06 a
Obese	0.911 ± 0.05 a
LSD value	0.154 **
** (P<0.01).	

The levels of AIP differ significantly (p<0.01) among diabetic groups (0.576 ± 0.04; 0.800 ± 0.06 and 0.911 ± 0.05) but over weight and obese(0.800 ± 0.06 ; 0.911 ± 0.05) were not significant (p>0.05), table (12-3), Figure 1.

Figure 1 showing Atherogenic index among diabetic patients

AIP values were above normal values (under 0.11) while 0.11 and 0.21 values of AIP associated with intermediate and high risk of CVD (5). Previous researchers they concluded that AIP was elevated in diabetic and neuro diabetic and could be used a marker for predicting CVD in patients groups. AIP showed the presence of atherogenic minute LDL and HDL molecules, is a marker prediction of heart atherosclerosis and cardiovascular dangerous as an alternative for IR.^{4,14}The AIP was significantly higher in 300 T2DM patients in Bangladesh and revealed dyslipidemia with increased TG and decreased serum HDL-C levels . AIP showed correlation BMI(r = 0.25), visceral fat (r = 0.37),

TC ($r = 0.22$), LDL ($r = 0.24$), HDL ($r = -0.72$), TG ($r = 0.84$), glucose ($r = 0.32$). Other Researchers the found TG to HDL was a strong prediction of heart infarction. That atherogenic index of plasma was an index of highest sensitivity for predicting the acute coronary events. That AIP correlation with BMI ($r = 0.182$, $P < 0.001$), (FBG ($r = 0.153$)). AIP is used for detection of Type 2 Diabetic Mellitus with high risk of complications¹⁵.

Conclusions

AIP is used clinically for prediction of Type Diabetic Mellitus with higher risk of complications and this correlated with lipid profile, BMI.

The relation between Serum Vitamin C and D, Calcium Intake With Obese Type 2 Diabetic Patients

Yasamin Abdul - amer Kadhum¹; Shaimaa D. Salman¹, Sabah Abdel- Hameid Abdel- Rahman¹,
Najat Sabah A. Hameid²

¹Biology department, faculty of science, Mustansiriya University, ²M.B.Ch.B/ Ministry of health/Iraq

Abstract

This study took place at Al-kindy hospital on 30 men with type 2 diabetes mellitus aged between (35-52) years old and 30 control men aged between (37-48) years old.

In addition, the body mass index, vitamin D and C, serum calcium were measured.

It was noticed that the body mass index increases in diabetic group (28.9 kg/m²) in comparison with the control group (24.2 kg/m²).

Besides, serum calcium, vitamins C&D showed a significant decrease in diabetogenic patients (7.601mg/ml, 0.61ng/ml,16.48ng/ml respectively)

Compared with the control ones (9.871mg/dl, 1.21ng/ml, 28.104ng/ml respectively)

Key Words: *Obese type 2 diabetic patients, antioxidant, vitamin C and D, Serum Calcium.*

Introduction

Gaining weight is a medical issue that has been expanding over the most recent couple of years because of increment of fast food causing cautions among numerous nations⁽¹⁾.

Vitamin C is viewed as an antioxidant agent, and auxiliary comparability among nutrient C and glucose makes it of enthusiasm for diabetes ⁽²⁾. Oxidation pressure can prompt aggravated glucose digestion and hyperglycemia ⁽³⁾. Along these lines, an advantage of cell reinforcements to counteract diabetes or to accomplish positive outcomes in type 2 diabetes mellitus (T2DM) is organically conceivable.

Vitamin D assumes fundamental job through entire body calcium homeostasis by applying exemplary impacts on the duodenum, bone and kidney ⁽⁴⁾ and modify intracellular calcium singles and in this manner assumes a job in pancreatic insulin discharge and insulin affectability, the two of which identify with Ca²⁺ levels. It has potential in the counteractive action of type 2 diabetes mellitus . A job of it in insulin opposition has been considered broadly and Vit.C is nutrient for whom

researchers have shown relationship with high glucose level⁽⁵⁾.

The blend of decreased serum 25-hydroxyvitamin D (25[OH]D) and lacking calcium admission has been related with heart and blood vessels hazard factors, for example, hypertension, overweight, metabolic disorder and type 2 diabetes mellitus ⁽⁶⁾. Vitamin D inadequacy and low calcium administration are accounted for, alittle is thought about the impact of those micronutrients in the avoidance of numerous infections, for example, heftiness ⁽⁷⁾. Be that as it may, a few examinations propose Ca and vit D admission don't avert nontransferable chronic ailments ⁽⁸⁾.

Point of this study is to know the impact of vit C and vit D as defensive measures in aversion of obesity and TDM2, and diminish its danger, additionally to think about the part of Ca admission take to diminish the danger of TDM2.

Material and Method

The study carried out on 30 men diabetic patients aged (35-52) years who visited the specialist center for endocrine and diabetes at Al-Kindy hospital in Baghdad,

and 30 men control aged (37-48) years were included in this study, the study was begun from January,2019 to march, 2019.

The body weights of individuals were measured by balanced and body heights of them were measured

by paper tape. Body mass index was calculated as weight(w) in Kilograms divided by height (H) in meters squared ⁽⁹⁾ with following formula

$$BMI = W/H^2$$

the values for BMI showed in table 1.

Table 1: measuring of Body weight

Risk of disease	Body mass index (Kg/m2)	obesity	Weight classification
Low	< 18.5		Under weight
Normal	18.5-24.9		Normal
Increased	25 -29.9		Over weight
High	30-34.9	Obese	Obesity
Very high 35 -39.9		Sever obese	
Extremely high	> 40	Morbidly obese	

Five milliliters of blood were drawn from each patient after (10-12) hours fasting via venipuncture , by syringes between (8-10 A.M), the blood sample was transferred into Gel tubes without anticoagulant serum were separated by centrifugation a 3000 rpm for 10 minutes used for the determination calcium, vitamin C and D.

The normal sufficiency of vitamin D is 10-44 ng/ml. However, the normal value of Ca is 8.5-10.2 mg/dl and to vitamin C is 0.4-1.8 mg/dL.

Table 1: weight classification by body mass index (WHO)

The statistical Analysis system SAS ⁽¹³⁾ program was implied for effect variation factors in study parameters. T-test was used to significant comparability between means.

Results and Discussion

The BMI showed highly significant increase (P<0.01) in adiabatic group (30.73) comparison with control group (24.2). Also, the age showed non-significant increase in diabetic group (45.09+2.86) in comparison with control group (44.89+3.21).

Table 2 showed that the diabetic patients BMI with overweight. ⁽¹⁰⁾.

Table 2. The means of Age and BMI in diabetic and control groups.

Groups	Mean + SD	
	Body mass index (Kg/m2)	Age group (year)
Control	44.89+3.21	24.2±0.87
Diabetic	45.09±2.86	28.9+1.21
T- test	0.29 NS	3.23
P-value	0.623	0.0005

NS=non significant **P<0.01

Overweight^[10] demonstrated that the most reduced danger of diabetes happens in people who have BMI under 21, expanding frequency of T2DM predominance was been found when obesity levels expanded . Nevertheless, abundant fat tissue adds to a chronic diseases, the use of unsaturated fats decreasing the utilization of glucose as a cellular vitality weight ^[11].

Despite the fact that age did not indicate noteworthy distinction among diabetic and control (Table 2). Expanded concentration of free fatty acids in blood builds glucose formation, and this will restrain insulin that takes apart in glucose take-up ^[12].

Obesity is viewed as a general medical issue that has been progressively arriving at disturbing extents in all districts of the world^[1].

Table 3 shows the changes in calcium, Vitamin D and Vitamin C, Calcium level was increased significantly (P<0.01) in control group 9.871 mg/dl compared with diabetic group 7.601 mg/dl.

Furthermore, the data were showing significant (P<0.01) elevation of vitamin D in control group (28.104 ng/ml) with the diabetic group (16.48 ng/ml). On the other hand, vitamin C was increased significantly (P<0.01) in control group (1.21mg/dL) compared with diabetic group (0.61mg/dL).

Table 3. Levels of Calcium, Vitamin D and Vitamin C (Mean± SD) in control and Diabetic Groups.

Groups	Mean ± SD		
	Calcium(mg/dl)	Vitamin D (ng/ml)	Vitamin C (ng/ml)
Control	9.871±0.862	28.104±3.572	1.21±0.053
Diabetic	7.601±0.973	16.48±4.104	0.61±0.035
T- test	1.283**	6.218**	0.42**
P-value	0.001	0.0052	0.001

** P<0.01

It is accounted for that 1.25 (OH)2D3 can control insulin emission out of pancreatic β-cells ^[14]. Quick increment in intracellular calcium [Ca²⁺], triggers insulin discharge. The job of 1.25(OH)2D2 in insulin emission gets from its impacts on Ca²⁺deluge assembly and buffering in pancreatic β-cells ^[15].

Moreover 1.25(OH)D3 has a significant job in the guideline of cell Ca²⁺ signaling that is connected to cell reactions, signaling and secretion^[16]. Supported Ca²⁺sign activated by 1.25(OH)2D2 inquired about to the guideline of apoptosis a procedure that can decide cell passing in diseases , for example, obesity and type 2 diabetes ^[17].

Besides, 1.25(OH)2D3 induces Ca⁺² signals (Ca⁺² motions) can manage insulin discharge from pancreatic β-cells [18]. Vitamin D status has been connected to insulin resistance and T2DM in observational studies^[19]

The complete calcium substance diminished in clear human lens between 18-55 years, it at that point expanded with age between 55-75 years ^[20].

Lack of 25-hydroxy vitamin 25(OH)D3 has been described as value of (20ng/ml) and has been perceived as a reason for childhood rickets and adulthood osteomalacia since the mid nineteenth century. Extreme insufficiency has been characterized as under 10ng/ml (25nmol/l) over the most recent 40 years, observational examinations have connected 25(OH)D lack to the advancement of chronic conditions including cardiovascular diseases and diabetes mellitus ^[21] . Vitamin D inadequacy is related with diabetes mellitus in elder working adults ^[22].

Vitamin D dissolve in fats actually, while vitamin C liquefy in water. Vitamin C is a cancer prevention agent and the auxiliary similitude between nutrient

C and glucose makes it of enthusiasm for diabetes [23]. Oxidative pressure can prompt disturbed glucose digestion and hyperglycemia [24;25]. Subsequently, an advantage of cancer prevention agents to counteract diabetes or to accomplish positive results in T2DM is organically conceivable. Inadequacy of vitamin C brings about blemished development of collagen and connective tissues in the skin, ligament, dentine, bone and blood, vessels, patients with diabetes should all get dietary guidance about good dieting and vitamin C dietary sources, including crisp leafy foods, the prescribed a dietary admission of the vitamin C is 45mg every day for grown-ups, vitamin C levels are lower among individuals with T2DM and not totally clarified by a distinction in dietary vitamin C consumption, various systems fundamental the abatement in vitamin C levels and expanded necessities in T2DM have been proposed expanding endogenous degree of vitamin C and D can be accomplished by dietary modifications^[26].

Conclusion

Vitamin D and C along with calcium are essential protective micronutrients to reduce and control type 2 diabetes mellitus especially in those suffering from obesity. Doctors should recommend a diet rich with those elements.

Assessment of Anti-Mullerian Hormone and Anti Ovarian Antibody in the Sera of Patients with Polycystic Ovarian Syndrome in AL-Najaf Al-Ashraf Province

Abbas Sahib Fakhar Al-Naffakh¹, Farhan Abood Risan¹

¹Middle Technical University/College of health and medical technology/Baghdad

Abstract

Polycystic ovarian syndrome(PCOS)is the most common endocrinopathy,that affects 5 to 20% of women in age of(12-45year)and cause a widespread of reproductive disorder in women and it is a major cause of hirsutism,acne,hormonal disturbance and infertility. Women with PCOS may associated with health conditions obesity,amenorrhea, oligomenorrhea,hyperandrogenemia and insulin resistance.The PCOS patients are with increased risk for type 2diabetes mellitus,diabetic complications,dyslipidemia and cardiovascular disease .

Objective: Aim of the study to investigate the pathogenicity,disease severity and early diagnosis roles anti-Mullerian hormone and anti-ovarian antibody in ladies with PCOS.

Conclusion: Polycystic ovarian syndrome was related to the increase level of AMH in different age of PCOS patients,which comprised 55.0% in PCOS patients that cause defect in ovulation and resulting fertility problem,while no relationship between anti-ovarian antibody and patients with PCOS.

Key words: AMH, AOA, PCOS and infertility.

Introduction

Polycystic ovarian syndrome(PCOS)is a common and complex endocrine issue and hormonal abnormalities which influences whole body,that affected 5 to 20% of regenerative age ladies,occurred in age of(12-45)year,and it is a main reason for hirsutism and fertility problem⁽¹⁾. PCOS is more typical than other conceptive infection; it is related with metabolic issue,for example,type 2 diabetes mellitus,dyslipidemia,hypertension and expanded risk of cardiovascular disease⁽²⁾.

The investigators between young adult and adolescent patients with PCOS found a few phenotypic differences ,where the more severe component of the phenotype was in young adults was obesity,with the mean body mass index(BMI)and prevalence of obesity and morbid obesity being higher in young adult compared with adolescent patients⁽³⁾. The etiology of PCOS not clear,but rather numerous elements might be related with PCOS,which include obesity,hyperandrogenism, insulin resistance that lead to compensatory hyperinsulinemia , increment discharge of luteinizing hormone (LH) and disappointment ovarian follicular improvement because

of expanded follicular advancement blocker paracrine factor , such as anti mullerian hormone (AMH) that produce from granulosa cell of follicles in size under 8 mm⁽⁴⁾.

The diagnosis of PCOS in ladies is ordinarily as indicated by the European society of human reproduction and embryology/American society of reproductive medicine(ESRHE/ASRM) criteria known as Rotterdam criteria, which rely upon nearness at any rate two of three highlights of oligo-ovulation/anovulation(menstrual dysfunction), hyperandrogenism and appearance of polycyclic ovaries in ultrasound look like the pearl string⁽⁵⁾.

Anti -Mullerian hormone:-

Anti-Mullerian hormone(AMH)also define as Mullerian-inhibiting substance,Mullerian inhibiting factor and Mullerian-inhibiting hormone.It is a glycoprotein dimer,it belongs to the member of the transforming growth factor beta superfamily,it is produced from the 36th week of gestation, by the granulosa cells of growing follicles of the ovary,primary,

secondary, preantral and antral, start produced at elevated values by the last two and has an a specific role in the evolution and maturation of follicles⁽⁶⁾. It has two main mechanisms of ovarian dysfunction by disrupting folliculogenesis through: suppress the initial induction of primary follicles from primordial follicles, and suppress the responsiveness of antral follicles to (FSH) through period induction (Fig.1).

Figure(1): Anti-Mullerian hormone(AMH)and folliculogenesis⁽⁷⁾.

The AMH stops the premature exhaust of follicle⁽⁷⁾. AMH level higher value at age 25 years, after that decreased to the menopause⁽⁶⁾. Circulating AMH levels in serum is high two or three times in the patients with PCOS than healthy women, and not influenced by the menstrual cycle nor changed through the use of oral contraceptives, thus it can be applied as a potent parameter for detection PCOS. AMH measurement is valuable because, it can be useful in predicting ovarian hyperstimulation, multifollicular complications and may be a novel marker for ovarian aging as well as evaluating treatment efficacy in PCOS. The starting of folliculogenesis is suppressed because increased values of AMH, in women with PCOS, increased AMH value have harmful role in disruption of ovarian physiology and worse fertility outcomes⁽⁸⁾. AMH also block the action of the aromatase enzyme, suppose that the AMH participate in the severity of PCOS, therefore can AMH may can be applied as a delegate parameter of classical hyperandrogenism. AMH has two receptors type I receptor (AMHR-I) is a non specific and type two receptor (AMHR-II) is specific by the AMHR2 gene

present on the AMH target organs such as mullerian duct and granulosa cells of ovary, binding of AMH to AMHR2 inhibit follicle development by suppressing recruitment of primordial follicles into the pool of developing follicles⁽⁹⁾.

AMH protein expression initiate at the primary follicle phase, very raise expression is determined in FSH-dependent preantral and small antral follicles of <4mm in diameter and AMH reduced and absent in follicles larger than 8mm. The distinctive feature of PCOS is failure of follicular development, causing anovulation and aggregation of preantral and small antral follicles, which may be contributed to high introduction of AMH⁽¹⁰⁾. Hyperandrogenism quickens preantral and antral follicle growth in the ovary, and expanded LH causes in premature luteinization resulting follicular arrest leading elevated values of AMH. It is likewise proposed the obesity had an extra prohibitory impact on gonadotrophin discharge because of an expansion in convert androgens to estrogens in fat tissue bringing about the concealment of LH and the subsequent restraint

of the dominant follicle⁽¹¹⁾.

level of AMH in women benefit as a biomarker of ovarian storage and refer to the small follicles cannot growth,if low in the clinical state of decreased ovarian store,indicating that presence a little number of follicles in the ovary.AMH block the premature evolution of follicles and eggs,this happen by decreasing the number of FSH receptors on ovaries and preventing the premature egg maturation by FSH in each cycle⁽⁶⁾.

Other importance of this hormone in various pathological conditions of ovaries not only the diagnosis and follow up of ovarian tumors of granulosa cell origin, but also prognosis of ovarian hyperstimulation syndrome and PCOS⁽¹²⁾.

AMH prevent the secretion of FSH and impact on growth of follicle by suppress the expression of aromatase enzyme dependent FSH and luteinizing hormone (LH) receptor.In PCOS ladies,there is a partition that keep the follicles to turn into the predominance follicle.In addition to the reduced value of FSH,increase values of AMH slower the responsiveness of follicles to FSH,therefore the follicles stop development into a predominance follicle,that cause an aggregation of several small antral follicles less than (9) mm in diameter in the ovary⁽¹³⁾.

Anti -ovarian Antibody: -

Polycystic ovarian syndrome is the endocrinopathy and disturbance that cause menstrual impairment and infertility through propagative age,genetic and hormonal status have important function in the pathogenesis of PCOS.Decrease secretion of progesterone in PCOS give rise to over-stimulation of immune system that increase oestrogen secretion that lead to different autoantibodies,have been reported in PCOS, for such as anti-nuclear antibodies(ANA),anti-thyroid,anti-histone,anti-islet cell and anti-ovarian antibodies (AOA)⁽¹⁴⁾.AOA is a group of auto-antibodies against ovarian antigens, include anti-oocyte plasma,oocyte membrane(zona pellucida),different parts of the ovary granulosa,theca interna and lutein follicular cells.Many causes for AOA formation,may be include chronic inflammation of the ovaries, laparoscopic abdominal surgery,the collection of oocytes for assisted reproductive techniques(ART)and also the presence of auto-antibodies against human heat-shock protein 90- β (anti-HSP90 β)in the sera of infertile women,this protein causes ovarian autoimmunity and is considered to be a marker of ovarian damage also associated with POF⁽¹⁵⁾.AOA

disrupt the development and function of oocytes and result a decline in the fertilization rate,thus they could likewise be an autonomous marker for possible ovarian failure.The AOA have antagonistically influence on egg quality or hinder the luteal stage and implantation. Presence of AOA either against tissues ovary or oocytes and presence of these AOA proposes detection of autoimmune process that might be the primary or secondary response to an ovarian combination,found high level of AOA in women after follicular puncture of unsuccessful in vitro fertilization(IVF) trials may be in charge of for the pathophysiology of unprompted miscarriages,additionally found with, endometriosis,other reproductive disorders such as adrenal failure,polyglandular autoimmune disorders,unexplained infertility and PCOS associated with anti-ovarian autoimmunity⁽¹⁶⁾.Another cause in the production of anti-ovarian antibodies may be an autoimmune process of POF.The anti-ovarian antibody are reported in premature ovarian insufficiency(POI),more found of an AOA(30-67%) autoantibodies has been reported in POI patients.A few antibodies in the aggregation of AOA are thought to connect with an immediate activity on ovarian tissue, while others have no such impacts, comparably to autoantibodies in the other autoimmune diseases, therefore it is conceivable that few various antigens are include in the ovarian autoimmunity on the grounds that both ovarian cell and zona pellucida,oocyte antibodies have been documented.The production of AOA in some cases was activated by hormonal incitement of ovaries and coordinated against(LH)receptors,or human chorionic gonadotrophin(HCG)receptors,or both of them,the AOA appraisal,demonstrates that AOA are particular coordinated to theca interna cells.Ovarian antibodies have been appeared to be available in infertile ladies in spite of the fact that demonstrating ordinary level of FSH and inhibin-B,recommending that ovarian antibodies are free indicators of potential of autoimmune ovarian defeat,the pathological importance for presence ovarian antibodies to different cell parts of the ovary can (a)diminish fertilization rates (b)decline pregnancy rates (c)create a poor reaction to gonadotropin prompting (d) influence egg and embryo improvement (e)could be in charge of implantation defeat⁽¹⁷⁾.

Materials and Method

Subjects

The present study consist of 120 women (80

PCOS patients and 40 control) attended from Al-Furat teaching hospital and fertility center of Al-Sadder medical city in Al-Najaf province. They were seen from (June/2018– October/2018). All these patients and healthy control were examined for PCOS diagnosis by ultrasound, measuring parameters including AMH and AOA. The AMH detected by (ELFA) technique by using minividas instrument (Biomerieux, France) and AOA measured by ELISA technique (Human, Germany).

Sample collection:

Venous blood samples (5mL) were collected from all patients and healthy controls by using disposable syringe, the specimens were taken during (2nd–7th) day of the menstrual cycle from those of patients and healthy control. The samples were collected by venous puncture and pushed slowly into a gel tubes, then centrifuged directly by centrifugation at (4000 rpm) for 10 minutes. Serum of AMH was measured immediately before stored and the remaining of the sera were stored at deep freeze in disposable plain plastic tubes, until the time of the analysis of AOA.

A. Inclusion criteria:

All patients must fulfill the international diagnostic criteria for PCOS.

All patients and control group should be more than (15 and less than 40) year.

The PCOS is diagnosed for not than one year ago.

B. Exclusion criteria:

Patients that do not fulfill the international diagnostic criteria for PCOS.

Any diagnosed case of PCOS under current medication.

Control with a previous history of PCOS and recovered

Patients of unexplained causes of infertility

Patients with other chronic disease .

Results and Discussion

Table (1) : Levels of AMH and AOA in sera of studied groups .

Parameters	Patients n=80	Control n=40	Statistics t test	p value	Sig.
	Mean ± SD	Mean ± SD			
AMH	7.75 ± 2.49	2.63 ± 1.21	t = 12.28, df = 118	0.001	HS
AOA	4.92 ± 2.52	4.52 ± 0.29	t= 4.875, df = 118	0.08	NS

The level of AMH in patients and healthy control.

Table(1) and figure(2) explained a highly significant elevation (P<0.01) in the mean concentration of AMH in sera of patients in comparison with the mean serum concentration of control [AMH (7.75 ± 2.49 ng/mL) and (2.63 ± 1.21 ng/mL)], respectively with a highly significant difference (P<0.01). At an optimal cut-off value of (1.19) ng/mL, AMH showed the sensitivity and specificity as 61.0 % and 85.0 % respectively, with a AUR (0.575) (95% CI: 0.471-0.679), as showed in table(2) below and figure(3) below. The current study appeared increased result of AMH in (55.0%) of PCOS patients more than normal value.

Table (2): ROC for studied parameters.

Parameters	Cutoff	AUR	95%CI	Sensitivity%	Specificity%
AMH	1.19	0.575	0.471- .679	61	85
AOA	1.5	0.651	0.552-0.750	88	85

Figure (2): Boxplot of AMH levels in studied groups.

Figure (3): ROC curve analysis of AMH to discriminate the studied groups.

This study agreed with recent Iraqi study finished by (Mohaisen *et al.*,2019)⁽¹⁸⁾ in Misan city. Several recent studies confirmed by (Deshmukh *et al.*,2019)⁽¹⁹⁾ in England and by (Cela. *et al.*,2018)⁽²⁰⁾ in Italy, that

reported increased AMH level in PCOS ladies than healthy ladies. The increase level of serum AMH in PCOS refer to the fact that AMH level indicate the count

of small antral follicles and increased secretion of AMH per follicle and therefore the increased AMH expression has been indicated in the phase of preantral and small antral follicle size (4-8mm) and dissolve in follicle size more than 9 mm⁽²¹⁾.

The increase of production of AMH prompt the decrease in the sensitivity of follicles to FSH at levels of receptors, which is very necessary for growing of this follicles, it leads to an increase of the numbers of antral follicles on the detriment of their size and the number of small antral follicles size(2-5mm) increases, therefore failure the selection of the dominant follicle and anovulation occur with oligo or amenorrhea⁽²²⁾.

Other cause for elevation AMH associated with the raise insulin levels that participate to hyperandrogenemia in (PCOS) that result a defect in folliculogenesis, then participate of polycystic morphogenesis of the ovaries

and increased AMH level than normal. An increase level of AMH is indicate either to inflexible anovulation or refer to ovarian hyperstimulation syndrome. Therefore, it is suggested that the apply of insulin sensitizers will decrease insulin resistance, hyperandrogenemia, and also lower AMH level in serum and will alter the anovulatory cycles to ovulatory⁽²³⁾.

Level of AOA in sera of patients and healthy control.

The serum AOA(U/mL) in table(1) and figure(4) illustrated a non significant difference ($P > 0.01$) in the mean concentration of AOA in sera of patients [serum AOA (4.92 ± 2.52) U/mL] in comparison with mean sera concentration of control group [serum AOA (4.52 ± 0.29) U/mL]. At an optimal cut-off value of (1.5) U/mL, AOA showed the sensitivity and specificity of 88 % and 85 % respectively, with a AUR (0.651) (95% CI: 0.552-0.750), as showed in table(2) above and figure(5) below.

Figure(4): Boxplot of AOA level in studied groups.

Figure(5):ROC curve analysis of AOA to discriminate patients from control.

The result of this study explained no correlation between the AOA and PCOS, where all the concentration of the AOA within normal value in patients and healthy control and no significance difference between them.

The studies about the relationship between AOA and PCOS very little, although the AOA is very important analytical tool to detect and explain the mechanism of disease development, evolution and resultant disrupt in the ovary.

The current result of this study agreed with study in USA occurred by (Aritro *et al.*, 2014)⁽²⁴⁾ which failed in different investigations to affirm presence of AOA in PCOS ladies. The study done by (Beata *et al.*, 2016)⁽²⁵⁾ in Poland confirmed a high prevalence of anti ovarian antibodies (AOA) about (30-67%) has been observed in patients with premature ovarian failure (POF).

Other study accomplished by (Pires *et al.*, 2015)⁽²⁶⁾ in USA reported presence of AOA as an auto immune antibody, after failure several attempts of in vitro fertilization (IVF) and also presence of it causes reduce IVF success.

The reason of not detect the presence of high level of AOA in PCOS patients may be due to presence hyperandrogenemia, which considering a protective function, high levels of androgen play a role in PCOS cases and prevent the development of autoimmune diseases⁽²⁷⁾.

Cervical Spinal Stenosis and Risk of Pulmonary Dysfunction: Case Control Study

Post graduate Student Esraa Hammadi Fahad¹, Zainab H. Hashim¹, Ihssan S. Nema¹

¹Dept. of Physiology, College of Medicine, Al-Nahrain University, Baghdad, Iraq.

Abstract

Background: Cervical spinal stenosis is well-defined as debility in the volume of the spinal canal. Consequently, distracting in the descending neural pathways at any level in the cervical spine lead to impaired smooth and effective breathing under normal conditions .

Objective: To assess the effect of cervical spinal stenosis (C5 and above) on pulmonary function tests , to assess the sensitivity and specificity of pulmonary function tests in patient with cervical spinal stenosis(C5 and above).

Methods: This is a case-control study which included 40 patients divided into two groups 30 females and 10 males patients with cervical spinal stenosis (C5 and above) and 60 healthy volunteers with body mass index < 30 (Kg/m²). Pulmonary function tests has been done for all subjects.

Results: The results demonstrate the comparison between all patients and controls show that VC EX% ,FEV1% ,FVC% ,PEF% ,MVV% , were significantly lower in patients in comparison to control groups as well as VC EX % ,FEV1% ,FVC % were significantly lower in male patients in comparison to controls and in female patients as compared to female controls and MVV% were significantly lower in female patients in comparison to male patients ,while no significant difference has been identified between patients and controls regarding age ,weight , height , BMI,VC IN% and FEV1\FVC % . Sensitivity and specificity and cut off value for pulmonary function tests parameters show FEV1% is the highest specificity and sensitivity.

Conclusion: The respiratory dysfunction that is established in patients with cervical spinal stenosis usually subclinical not overt defect that compromised respiration ,this pulmonary dysfunction is a type of restrictive lung disease since phrenic nerve is affected. . FEV1% is most essential among other parameters of spirometry in patients with cervical spinal stenosis.

Keywords: Cervical spinal stenosis, pulmonary function tests, Spirometry

Introduction

Stenosis of cervical spine is well-defined as a waning in the volume of the canal of spine.^[1] Even though stenosis of the central canal can transpire everywhere alongside the length of the spine, this condition is deliberated more threatening with greater forthcoming for serious neurological sequelae when it occurs in the cervical spine.^[2,3,4]

Degenerative cervical myelopathy DCM is judged to be the most common cord of spine illness, and is predictable to have an increasing prevalence with the aging population in the work world.^[5]

Respiratory function has been well-ordered by the phrenic (C3–5) nerves, the intercostal (T2–10) nerves, and autonomic nerve, especially the sympathetic (T1–L3) nerves. Consequently, distracting in the descending neural pathways at any level in the cervical spine lead to impaired smooth and effective breathing under normal conditions. The effect might lead to the worsening of pulmonary function even if the impairment of neural function was subclinical.^[6,7,8]

Method

This is case control, nonrandomized, single-center study evaluating pulmonary function tests in patients

with cervical spinal stenosis (C5 and above) who attend orthopedic and neurosurgical consultations in AL-Imamian AL-Kadhymiyian medical city during period from November 2018 to May 2019.

40 patients divided into two groups 30 females and 10 males patients with cervical spinal stenosis (C5 and above) with age range from (25 to 70) years and body mass index < 30 (Kg/m²). The duration of their illness ranges from (1 to 24) months.

All patients were clinically examined and diagnosed by MRI with or without CT scanning and X ray of the cervical spine to determine the level of compression. The diagnosis was supported by trans cranial magnetic stimulation (TMS) technique. Smokers and (x) smokers for at least six months, systemic disease known to cause peripheral neuropathies (Diabetes Mellitus), Spinal tumor, chronic pulmonary disease. Central obesity (WC ≥94 cm for men and ≥80 cm for women),^[9] or waist-to-hip ratio (WHR)≥0.90 in men and ≥0.85 in women and a WHTR of >0.50^[9], BMI ≥ 30(Kg/m²) had been excluded from the study. Sixty apparently healthy peoples aged and sex matched nonsmoker nor centrally obese as volunteers control group thirty males and thirty females .Their age ranges from (30-75) with BMI < 30 (Kg/m²).

Pulmonary function tests have been done for all subjects, the result was presented on a discrete paper in a special form. The tests incorporated the following: Vital capacity in inspiration VC IN, Vital capacity in expiration VC EX, Forced expiratory volume in

1st second FEV1, Forced vital capacity FVC, Forced expiratory flow between 25-75 of the FVC or Forced mid –flow (FEF25-75%,FMF), Peak expiratory flow rate PEFR , Mean voluntary ventilation (MVV), ratio of FEV1 to FVC (FEV1/FVC). Predicted values of the Spiro metric parameters were based on the patient's height, age, and sex. The percentage of predicted values was used for comparison.

$$\% \text{ predicted} = \text{measured} \div \text{predicted}^{[10]}$$

The study approved by the Institutional Review Board (IRB) of the college of Medicine, Al-Nahrain University and informed consents were obtained from all the participants.

Statistical analysis

Statistical analysis was performed with SPSS V23. (statistical package for social sciences) and also Excel 2007 programs. Data analysis was done using t-test and the values were considered statistically significant when p-value < 0.05. For each parameter the sensitivity and specificity by ROC analysis.

Results

Table 1 shows that VC EX%, FEV1%, FVC%, PEF%, MVV%, were significantly lower in patients in comparison to control groups (P<0.001), (P<0.001), (P<0.001), (p=0.042), (P=0.037), respectively .While there were no significant difference has been identified between patients and controls regarding age ,weight , height , BMI,VC IN% and FEV1\FVC%.

Table (1): Comparison of data between all patients and all controls by unpaired t test

Parameter	All Patients N=40 Mean±SD	All Controls N=60 Mean±SD	P value
Age (yr)	50.05+12.5	49.92+11.04	0.955
Weight (kg)	67.05+8.04	70.42+9.36	0.066
Height (cm)	159.93+8.99	162.28+9.49	0.217
BMI (kg/m2)	26.21+2.29	26.71+2.29	0.282
VC IN%	90.48+14.35	94.33+13.58	0.177
VC EX%	79.23+11.24	90.86+11.8	<0.001
FEV1%	89.16+15.59	105.53+14.04	<0.001
FVC%	77.26+13.1	90.56+12.69	<0.001
PEF%	85.21+14.82	93.21+21.32	0.042
FEV1\FVC%	95.72+4.08	96.56+3.89	0.302
MVV%	98.42+16.77	106.14+18.55	0.037

Table (2) shows that VC EX %, FEV1%, FVC % were significantly lower in male patients in comparison to controls (P=0.001) (P=0.004), (P=0.002) respectively. While there were no significant difference has been identified between male patients and male controls regarding age, weight, height, BMI, VC IN %, PEF%, FEV1\FVC%, and MVV%.

Table (2): Comparison of data between male patients and male controls by unpaired t test

Parameter	Male Patients N=10 Mean±SD	Male Controls N=30 Mean±SD	P value
Age (yr)	55.5+12.07	52.9+11.38	0.541
Weight (kg)	75.0+6.38	73.87+10.46	0.749
Height (cm)	170.5+5.97	168.4+7.89	0.446
BMI (kg/m ²)	25.78+1.44	25.94+2.43	0.850
VC IN%	84.7+14.11	89.94+12.36	0.269
VC EX%	74.71+7.51	88.32+11.71	0.001
FEV1%	88.18+12.5	105.81+16.36	0.004
FVC%	73.51+9.75	88.9+13.08	0.002
PEF%	89.59+14.02	92.1+16.41	0.667
FEV1\FVC%	95.36+3.11	95.9+4.33	0.715
MVV%	119.11+11.67	119.2+15.24	0.987

Table (3) shows that: VC EX%, FEV1%, FVC % were significantly lower in female patients in comparison to female controls (p<0.001), (p<0.001), (p<0.001) respectively. While there were no significant difference has been identified between female patients and female controls regarding age, weight, height, BMI, VC IN%, PEF%, FEV1\FVC%, MVV%.

Table (3): Comparison of data between female patients and female controls by unpaired t test

Parameter	Female Patients N=30 Mean±SD	Female Controls N=30 Mean±SD	P value
Age (yr)	48.23+12.3	46.93+10	0.655
Weight (kg)	64.4+6.73	66.97+6.65	0.143
Height (cm)	156.4+6.8	156.17+6.59	0.893
BMI (kg/m ²)	26.35+2.52	27.48+1.86	0.051
VC IN%	92.4+14.14	98.73+13.49	0.082
VC EX%	80.74+11.96	93.4+11.53	<0.001
FEV1%	89.48+16.67	105.25+11.54	<0.001
FVC%	78.5+13.96	92.21+12.29	<0.001
PEF%	83.74+15.02	94.32+25.55	0.056
FEV1\FVC%	95.84+4.39	97.22+3.33	0.177
MVV%	91.52+11.79	93.08+10.72	0.594

Table (4) shows that : weight, height, MVV% were significantly lower in female patients in comparison to male patients, ($p < 0.001$). While there were no significant difference has been identified between male and female patients regarding age, BMI, VC IN%, VC EX%, FEV1%, FVC %, PEF%, FEV1\FVC%.

Table (4): Comparison of data between male and female patients by unpaired t test

Parameter	Male Patients N=10 Mean±SD	Female Patients N=30 Mean±SD	P value
Age (yr)	55.5+12.07	48.23+12.3	0.112
Weight (kg)	75.0+6.38	64.4+6.73	<0.001
Height (cm)	170.5+5.97	156.4+6.8	<0.001
BMI (kg/m ²)	25.78+1.44	26.35+2.52	0.507
VC IN%	84.7+14.11	92.4+14.14	0.144
VC EX%	74.71+7.51	80.74+11.96	0.144
FEV1%	88.18+12.5	89.48+16.67	0.823
FVC%	73.51+9.75	78.5+13.96	0.303
PEF%	89.59+14.02	83.74+15.02	0.286
FEV1\FVC%	95.36+3.11	95.84+4.39	0.747
MVV%	119.11+11.67	91.52+11.79	<0.001

Table (5) shows:

Cutoff value of VCIN%, VCEX%, FEV1%, FVC%, PEF%, FEV1\FVC%, MVV%

In ROC were estimated and consequently the sensitivity and specificity were evaluated FEV1% show the highest specificity and sensitivity.

Table (5): Area under curve, sensitivity, specificity and cutoff value for pulmonary function tests parameter

Parameters	AUC	Sensitivity	Specificity	Cut-off value
VC IN%	0.573	53.3%	55.0%	91.25
VCEX%	0.779	70.0%	70.0%	82.2
FEV1%	0.813	75.0%	75.0%	95.1
FVC%	0.784	66.7%	67.5%	82.6
PEF%	0.623	56.7%	60.0%	86.75
FEV1\FVC%	0.554	56.7%	57.5%	97.02
MVV%	0.624	61.7%	62.5%	100.06

Discussion

Patients with compressive cervical spinal stenosis designated by the spirometric data as mild but considerable impairment of respiratory function. Lesion in the cervical spinal cord can lead to respiratory insufficiency by disturbing the descending pathways.^[11]

The present study show no significant differences between age ,height ,weight of patient and control groups and this resembling to study done by (Toyoda et al).^[11]

Pulmonary functions endure the major biologic variable that is affected by aging. There has been great individual variation in the extent of the aging process in the lungs. Even in individuals with good health, there are quantifiable decrements in function of the respiratory system with age.^[12]

The weight is another factor that have been with adverse effect on lung function which showed by various studies.^[13,14] Congregation validation designates that the association between increase in weight and both lung volume and lung function , the lung volume and capacity that reduced in overweight subjects compared with healthy subjects.^[13]

The present study showed that VC%, FVC%, PEF%, FEV1%, MVV% of patients were significantly lower than controls.

The probable explanation for the pathomechanism of this may embrace that the phrenic nerve has been partial injured, decrease in the strength of the respiratory muscle, and the intercostal muscle tone loss. In healthy individuals the parasympathetic activity has been prime, so in the mild respiratory dysfunction imbalance of the autonomic nervous system has been arise.^[11] Consequently, sympathetic activity has been predominant in the chronic compression of the cervical spinal cord in addition to diminish in peripheral airway resistance.

The present study show no significant difference between FEV1\FVC % of patients and controls and this agreement with Bhagavatula et al,^[10] since in our study the result of spirometric data involve normal and restrictive lung function values ,so according to study done by Pellegrino et al^[15] which state that restrictive ventilation disorders are characterized by a reduced TLC with normal FEV1/FVC , Spirometry can confirm that FVC is reduced, while FEV1 may be reduced secondarily to a reduction in FVC, or relatively maintains as normal.

As a result, FEV1/FVC is normal or may increase slightly.

The present study show MVV % was significantly lower in females in comparison to males' patients. This is in accordance with the study done by Budhiraja et al;^[16] this can be attributed to the fact that the men have bigger lungs for the same height as compared to females. Another contributing factor could be the greater strength of respiratory muscles in males.^[17]

The present study shows that FEV1% has the highest specificity and sensitivity among other parameters of spirometry in patients with cervical spinal stenosis since the classification of the severity of obstructive and restrictive impairments based upon the grade of reduction in FEV1 and VC respectively^[18] otherwise the categorizing of restrictive impairment stated by ERS(European respiratory society) in 2005 has been established based on predicted FEV1% ^[15], the categorization of both obstructive and restrictive impairment has been recommended by ERS using FEV1 due to easiness compared to ATS method , the reasonable for such a suggestion, in disorders presenting with restrictive defects, is because the FEV1/VC ratio is conserved (normal or increased) and therefore the reduction in FEV1 has been correlated with the analogous reduction in VC .

Conclusion

The respiratory dysfunction that is established in patients with cervical spinal stenosis usually subclinical not overt defect that compromised respiration ,this pulmonary dysfunction is a type of restrictive lung disease since phrenic nerve is affected. . FEV1% is most essential among other parameters of spirometry in patients with cervical spinal stenosis.

Abstract

Background : *Streptococcus pyogenes* (GAS) strict human pathogen that give rise to a wide range of diseases. GAS is the most current bacterial cause of pharyngitis and firstly effect school-age children 5-15years of age. SPY1258 gene is a specialized gene group in GAS and its considered specific for GAS and can be used for its detection as a markers.

Method : A total of 300 throat swab were collected from patients suffering from pharyngitis referred to Fallujah general teaching Hospital, Fallujah taeching Hospital for women and chiladren and Amerya general Hospital , Iraq during a peroid between 2018-2019.

Theses samples were submit for bacteriology and molecvular tests.

Results : Out of all samples screened 43 isolates (14.3)were identified as β – hemolytic streptococci and only 13 isolates were detected as streptococcus pyogenes by bacteriology and biochemical test and also by PCR GAS isolates exposed in order to detect the particular gene (SPY1258). Antibiotic sensetivity test showed a high incidence of bacterial resistance to macrolids.

Conclusion : Bacitracin sensetive is non- specific test for the identification of *Streptococcus pyogenes*, and should be used further test, for best result should confirmed by SPY1258 gene. The SPY1258 gene can be used for accurate molecular diagnosis of *Streptococcus pyogenes* .

Key words: *Streptococcus pyogenes*, SPY1258, pharyngitis

Introduction

Streptococcus pyogenes , a group A streptococci (GAS), is strict human pathogen that give rise to a wide range of diseases , from moderate to acute invasive diseases . *Streptococcus pyogenes* is countable for over than 500000 death each year ⁽¹⁾.

β - hemolytic *streptococci* produce a toxin that forms a clear zone of hemolysis on blood agar, confirmation its strength to devastate red blood cells. This hemolysis is referred to toxins created by *Streptococcus pyogenes* called “Streptolysins” which can destroy the red blood cells and also the white blood cells which is responsible for destroying pathogen ⁽²⁾

The skin and mucus membranes of the human host are the only reservoirs for *Streptococcus pyogenes* in nature . The major reservoirs of *Streptococcus pyogenes* are the school aged children (5-15) years ⁽³⁾ .

Pharyngitis(sore throat) is one of the most widespread situation encountered by the family practitioner ⁽⁴⁾.

Streptococcus pyogenes is the most current bacterial cause of pharyngitis and firstly affect school-age children 5 – 15 years of age ⁽⁵⁾ .

The universal development of antibiotic resistance between GAS strains , and the economic crisis emerge out of it in healthcare industries has presupposed the need for an alternative agent with novel texture features⁽⁶⁾

SPY1258 gene is a specialized gene group in *Streptococcus pyogenes* which encodes transcriptional regulators. As transcriptional regulators represent fundamental molecular combination in the adaptation and existence of *Streptococcus pyogenes* (7).

Materials and Method

Three hundred swabs were collected from children with pharyngitis ranging in age from 4 to 14 years, who referred to Fallujah General Teaching Hospital, Fallujah Teaching Hospital for Women and Children, The Health Center of the Primary Health Care Sector in Fallujah, Health Centers in Refugee Camp and Special Medical Clinics in the Fallujah City. During the period from November 2018 to May 2019.

Throat swab was taken from the pharynx of each patient, and immediately placed in a trypton soya broth with 5% blood and transferred to TSA, the plates were incubated at 37°C for 18 to 24 hours under 5-10% CO2, in the candle jar (8).

Identification of streptococcus pyogenes :

The identification of the colonies were confirmed based on morphological and growth features, including the phenotypically discrete colonies, beta-hemolysis on blood agar plate. Biochemical test and Bacitracin discs susceptibility were used in order to confirm streptococcus pyogenes. GAS diagnosis was confirmed by using Vitek 2 Compact.

Antimicrobial susceptibility testing :

The standard disc diffusion method on Muller-Hinton agar supplemented with 5% blood was done in order to confirm GAS isolates and Antimicrobial

susceptibility. Incubated for at least 24 hours at 37°C in air enrichment with 5-10% carbon dioxide. The appropriate discs with known concentrations were used such as Penicillin G, Ceftriaxone, Vancomycin, Azithromycin, Erythromycin, clindamycin, Levofloxacin, chloramphenicol, Ampicillin sulbactam.

The interpretation of the results for the sensitivity testing were done depending on clinical and laboratory standard institute (CLSI).

Effect of Trans-cinnamic acid and 4-amino-2-hydroxybenzoic acid as antibacterial agent :

In our study we tested the effectiveness of some ligands (Trans-cinnamic acid and 4-Amino-2-hydroxybenzoic acid) against the viable cells of different strains of *Streptococcus pyogenes*. The method of Agar diffusion by wells was followed to prove the inhibitory activity of ligands. In this study, four different concentrations (25mg/ml, 50 mg/ml, 75mg/ml, 100mg/ml) of each ligand were applied on five sensitive and resistance strain of *Streptococcus pyogenes* and the inhibitory activity of these ligands determined by measurement of the zone of inhibition.

DNA Extraction :

GAS isolates were inoculated on Brain heart infusion broth and incubated at 37°C for 24 hours. After then genomic DNA extracted from a fresh brain heart infusion broth by using the instructions above.

SPY1258 gene polymerase chain reaction :

SPY1258 gene were synthesized from Alpha DNA (Alpha DNA Co., CA, USA) which were designed according to (7) Table(1).

Table (1) : Sequence of primer sets used for PCR amplification of SPY1258 gene.

Gene	Primer name	Primer Sequence	Product length
SPY1258	SPY1258 (F)	5' AAAGACCGCCTTAACCACT3'	407bp
	SPY1258 (R)	5' TGCCAAGGTAACTTCTAAAGCA 3'	
Company		Alpha DNA / Montreal	

The PCR reaction kit (Gotaq gene master mix) was chosen from the promega and the PCR program which are used in amplification of the DNA target were included in a total volume of 25 µL in 0.5 mL eppendorf tube containing 5 µL templet DNA, 12.5 µL PCR master mix, 2.5 µL of each primer, 2.5 µL PCR water. The reaction for *eaeA* was included in a total volume of 25 µL in 0.5 mL eppendorf tube containing 2 µL templet DNA, 12.5 µL PCR master mix, 2 µL of each primer, 6.5 µL PCR water.

The PCR amplified products were detected and analyzed in 1.3gm% agarose gel electrophoresis with presence of (0.5mg/ml) ethidium bromide , and the detection of the specific band 407bp in UV transluminater.

Results

The results of our study showed that from 300 throat samples from children with pharyngitis , 43 (14.3%) samples were β – hemolytic streptococci , 73 (24.4%) isolates of Alpha – hemolytic streptococci , 87 (29%) isolates of Staphylococcus spp. , 23(7.6%) isolates of candida and 74 (24.7%) throat swab were no growth , table (2) .

Table (2) :Number and percentage of isolated bacterial isolates .

Type of Microorganism	Number of isolate	%
β – hemolytic streptococci	43	14.3%
α-hemolytic streptococci	73	24.4%
Staphylococcus.spp	87	29%
Candida.spp	23	7.6%
Negative throat swab	74	24.7%
Total isolates	300	100%

Out of 43 β- hemolytic streptococci isolates , GAS were detected in 13(4.3%) . The isolates of *streptococcus pyogenes* were identified according to the phenotypic identification criteria . The streptococcus pyogenes isolates belonged to 10(3.3%) male and 3(1%) female patients .

Out of 43 β– hemolytic streptococci there 30 isolates belonging to bacteria other than *Streptococcus pyogenes* were diagnosed , such as *streptococcus Salivarius* , *Streptococcus alactolyticus* , *Streptococcus agalactiae* and *Granulicatella adiacens* .

The results from susceptibility test of *streptococcus pyogenes* are presented in figure (1) , showing that chloramphenicol revealed high activity with 92% of the strain susceptible . In the present study observed the good activity of β – lactams antibiotic against the streptococcus pyogenes with 84% and 70% of the isolates were susceptible to the Ampicillin sulbactam and Penicillin G respectively .

As for Ceftriaxone, it showed greater activity than Penicillin were 76% of strain were sensitive. In this study of clindamycin and Vancomycin were also good active against *streptococcus pyogenes* with susceptibility rate 76% of isolates.

Levofloxacin also revealed good activity 69% of isolates were susceptible.

In this present study *streptococcus pyogenes* revealed high resistance to macrolid antibiotic, the percentage of resistance for Erythromycin and Azithromycin of *streptococcus pyogenes* were 69% and 38% respectively .

The result depicted in figure (1) showed the percentage of bacterial resistant to antibiotic .

Figure (1) : percentage of bacterial resistant to Antibiotic .

The results revealed high effect of Trans – cinnamic acid and 4-amino-2-hydroxybenzoic acid. Trans-cinnamic acid showed good activity at concentration 75mg/ml and the concentration 100mg/ml . figure (2) .

Figure (2) : The results described as high sensitive to the new ligands at concentration 75mg/ml and 100mg/ml .

While 4-amino-2-hydroxybenzoic acid revealed very good activity against *Streptococcus pyogenes* at all concentration figure (3) .

Figure (3) : Excellent activity of 4- amino -2-hydroxybenzoic acid .

The results in the current study were shown that the occurrence of *streptococcus pyogenes* 13 from the total 300 isolates. In the present study, the diagnosis of *streptococcus pyogenes* isolates was confirmed by conventional PCR .

The results depicted in figure (4) reveals the presence of the diagnostic bands of the SPY1258 gene, which has a molecular weight of 407 base pairs in all 13 isolate 100% , that gave positive result to vitek examination .

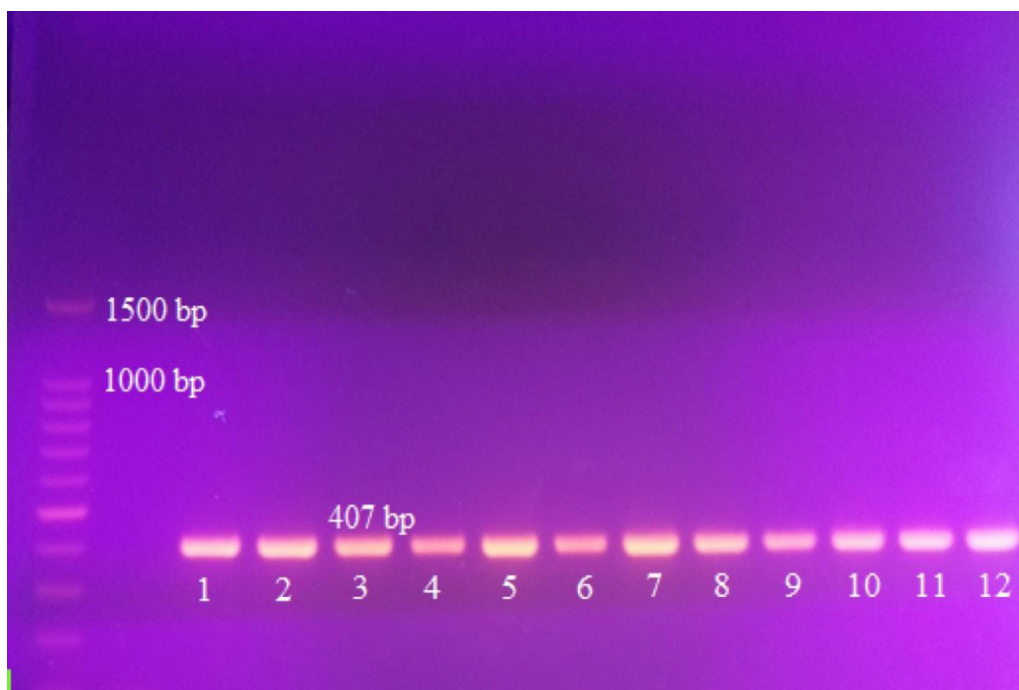

Figure (4) : Gel electrophoresis for PCR product of SPY1258 gene.

Discussion

Our study revealed that *Streptococcus pyogenes* was detected based on bacteriological methods (Bacitracin procedure and vitek compact 2) and identified by PCR

technique. In our study observed that the SPY1258 gene was generated from whole 13 *Streptococcus pyogenes* strains only, but not from all 43 β -hemolytic streptococci isolated, this results confirm that SPY1258 gene was

definit gene only for *Streptococcus pyogenes* and can be used as a marker for its detection⁽⁹⁾. These results were in agreement with studies conducted by⁽¹⁰⁾ this study revealed that SPY1258 gene was particular for GAS only. But not from another species of the genus *Streptococcus*.

And also a agreement with results of⁽¹¹⁾ showed that the SPY1258 gene was present in all *Streptococcus pyogenes* isolates our study finding were disagreement with⁽⁹⁾ who reported that out of 24 *Streptococcus pyogenes* isolate only 21 isolates had this gene.

This study shows that the prevalence of (3.3%) in males was higher than that recorded in females (1%).

These results agreed with that reported by Al-Gebori⁽¹²⁾ in Iraq that indicated male have more prevalence of infection than females. While our study results was in disagreement with⁽¹³⁾ who reported the females were more susceptible and response for infection with males ti ratio (3:1) the prevalence of *streptococcus pyogenes* infection in this study was (4.3%) this is in agreement with finding of⁽¹⁴⁾ who reported a prevalence of 5.3% for *streptococcus pyogenes* pharyngitis. This results were approach to the ration 2.96% obtained by the researcher⁽¹⁵⁾ who reported the prevalence of *streptococcus pyogenes* infection was (2.5%). The results in this study was higher than the results of (1.96%) reported by⁽¹⁶⁾.

The result is lower than a percentage (15.3%) reported by⁽¹⁷⁾.

The lower prevalence of GAS reported in this study, may be due to the fact that major of the patients examined were found to be on antibiotic as most pharyngitis is viral in origin, streptococcus pyogenes pharyngitis is responsible for around 15% over all cases and 80-90% of cases are caused by viruses.

Our study finding that the percentage of resistance for the Erythromycin and Azithromycin were 69% and 38% respectively. This result agreement with findings of⁽¹⁸⁾ who reported high macrolid resistance (40-70%) in Taiwan. This result is dramatically different from that has been reported in Saudi Arabia showed that the resistant was only 6.3%⁽¹⁹⁾.

The main reason for this high rate of resistance that found in the current study, could be attributed to high misuse of Macrolid antibiotic in Iraq.

The present study revealed excellent activity of trans-cinnamic acid and 4-amino-2-hydroxybenzoic acid against *Streptococcus pyogenes*.

This result is in agreement with a work carried out by⁽²⁰⁾ who reported that the cinnamic acid is considered and interesting for the evolution of novel antimicrobials.

This finding is in agreement with a research done by⁽²¹⁾ who revealed that the paraaminobenzoic acid is one of a series of propargyl-linked antifolates, which is very active against GAS and dihydrofolate reductase enzyme from bacterial.

Design in line LMA-10 Photonic Crystal Fiber MZI for Detection and investigation of Beta Thalassemia

Layla M. Alameri¹, Tahreer S. Mansour¹, Fareed F. Rashid², Sara J. Belal²

¹*Institute of Laser for Postgraduate Studies, University of Baghdad., Baghdad, Iraq,*

²*Fareed F. Rashid and Sara J. Belal are with the Department of Laser and Optoelectronics Engineering from University of Technology, Baghdad, Iraq*

Abstract

Consequent to the scarcity of removable rapid diagnostic examines for detecting the thalassemia, specially beta thalassemia trait or Cooley's Anemia, present detection methods include the collection of the blood, which then required being more tests before reports can be made by the treating physicians. Traditional methods like hemoglobinopathy tests and blood picture are time expending, needing specialized technical personnel, extra huge and costly laboratory instrument. Here, we simulated and demonstrated micro-hole collapsing, type of Mazh-Zehnder interferometer (MZI) that formed using LMA-10 fiber, with a laser beam for detection the most common type of anemia, beta thalassemia trait or Cooley's Anemia. This interferometer made-up of two conventional optical fibers splicing to apart of photonic crystal fiber (PCF). This method makes a high sensitive regions for the optical characteristics in the blood sample. Biological changes in the blood sample consequent to the presence the beta thalassemia trait lead to changes optical characteristics (refractive index and absorption) of the blood sample the demonstrated laser biosensor has the ability for use as a removable, rapid diagnosis examines and the high sensitive which rises to 24.367 ABS/RIU.

Keywords: *Beta Thalassemia; Crystal Fiber MZI; LMA-10 Photonic*

Introduction

DUE TO the special characteristics of optical fibers, they are used in a wide variety of applications specially as a biosensor for high precision measurement⁽¹⁾. These have a large role in different biological applications after production a new design of these fibers, fiber Bragg grating and photonic crystal fiber,^(2,3). Designing Laser biosensor needs a new modification of fiber core either using a new material to produce a fiber Bragg grating (FBG) or by using a new fiber cladding that has many holes arranged in a honey comb with either hollow or silica core⁽⁴⁻⁷⁾. Different techniques must be used for producing in line fiber sensor that are scraping, cleaving and fusion splicing either solid or hollow cores photonic crystal fiber may be with 19 or 7 cells^(8,9,10). Laser biosensors have a many roles in different fields, such as immunoassays and drug detection due to their high precision and sensitivity^(11,12). In general, optical sensors can be distributed into four classes based on changing in light parameters such as polarization modulation intensity modulation, wavelength modulation, and phase modulation.

Intensity modulation was used in early optical sensor development due to its low cost, simplicity, and reliability^(13,14). This intensity modulated signal comes from Fiber Bragg grating as a sensing head that may be used as optical band pass or notch filters^(15,17). The traditional tests of beta thalassemia trait is by hemoglobinopathy analysis and complete genotype which identified the beta thalassemia trait. Beta thalassemia trait also is an important manner for decreasing the expression of HbA2 with level as low as 3.6% on high performance liquid chromatography (HPLC). This type of anemia needs regular blood transfusions and special medical care through their life. The beta thalassemia trait is the most widespread anemia in the south chinees populations. This type of anemia may be not easy to do correct diagnostic who examined on HPLC^(18,19). In this study, we present invasive beta thalassemia trait detection biosensor using in-line PCF MZI and laser beam. This type of sensor depends on light intensity measurement through a modified optical fiber.

LASER BIOSENSOR BASED ON MICRO-HOLE COLLAPSING METHODS: DESIGN AND PRINCIPLE

At the beginning, single mode fiber (SMF-28) had been spliced with an inexpensive 1.5cm solid core photonic crystal fiber length, LMA-10, with cladding diameter: 125 μm and core diameter: 7.0 μm . The cross section of the PCF (LMA-10).

The splicing was done by using Fujikura (FSM-60S) splicing machine according to trial and error. The fusion power and fusion time have been changed.

After the fusion splicing, the air holes of PCF collapsed and an elliptical air cavity was created in the tapering region. The schematic diagram and image of the microscope of the MZI are shown in Fig. 1

Fig. 1. schematic and microscope image of MZI.

As we know, the output intensity of this interferometer is given by [20]:

Where I represent the intensity of the interference signal, λ is the wavelength, L denotes the interference length, Δn_{eff} denotes the effective refractive index difference between two interference arms. The shift in the output transmission spectrum is caused due to the optical path difference $\Delta n_{\text{eff}} L$ (14,16-19). The MZI after tapering is based on the combination of two types of in-line-fiber Mach-Zehnder interferometer (14-16,18,19).

The interference in the air cavity. At the collapsing region, the beam of the input light is split into two beams. One of these beams transmits through the silica wall, while the other travels along the internal air cavity, and the interference obtains when two output beams recombine at the collapsing region on the other side of the air cavity. In this case, the effective refractive index difference (marked as Δ) can be given as: $\Delta = n_{\text{core}} - n_{\text{cladding}}$, where n_{core} and n_{cladding} Refer to the effective RI of the silica wall and the air

cavity, respectively.

The interference in the photonic crystal fiber. The incident beam gradually expands in the collapsing region between the air cavity and the PCF, and lots of high order modes are excited, including the cladding modes. The high order modes are recombined by the collapsing section on the second side of photonic crystal fiber and interference with the fundamental core mode. Thus, the effective refractive index difference (marked as Δ) can be expressed as: $\Delta = n_{\text{core}} - n_{\text{cladding}}$, where n_{core} and n_{cladding} Refer to the effective RI of the core mode and the cladding mode of the photonic crystal fiber. Finally, Δ are sensitive to the external refractive index while n_{core} and n_{cladding} are not. So Δ of both types of interference will change with external refractive index.

sample testing:

The Absorption Spectrum Measurement of the Blood Sample

A spectrophotometer (SP-8001) which runs in wavelength range from (190-1100) nm has been used to find the UV-Visible absorption spectrum of blood sample. Figure 6. shows the set-up of UV-Visible-IR Spectrophotometer. Sample of blood had been filled in the quartz cuvette and the absorption spectrum found. The selection of the light sources is done according to absorption spectrum have been obtained.

The Refractive Indices Measurement of the Blood Samples

The refractive indices of health and patient blood samples were measured by using Abbe refractometer.

The experimental measuring can be calculated by using the following equation:

Where n_{air} is the experimental RI value measured at temperature, T .

In this study, difference blood samples lead to change the modes effective refractive index of the clad of the fiber. This change of the cladding refractive index (n_{cladding}) due to the change in refractive index value of blood samples changes transmission intensity.

Results and Discussion

The Absorption Spectra for the Blood Sample

The absorption spectra for blood sample and

urine sample are measured by using (T60 UV-VIS) Spectrophotometer to select the suitable wavelength of laser source for the detection set-up. A figure 2.shows the absorption spectra for the blood sample.

Figure 2.the maximum absorbance of the blood sample is for wavelengths in the range (470-590) nm. Thus, using green laser 532nm as laser source for laser biosensor for blood test is quite convenient.

Detection of Beta Thalassemia Trait by Using Laser Biosensor

As mention previously laser source is used (532nm wavelength, power 12.2nw) which chosen according to the blood absorption spectrum. PCF (LMA-10) with 1.5cm length is used in this experiment. The transmitted intensity of this laser without any blood sample is shown in the figure below:

Fig. 3.The output spectrum of the green laser 532nm.

The maximum output reference intensity before immersing sensor with any blood sample was 3159. Blood samples were taken from healthy and patients with beta thalassemia trait. The patient samples were diagnostic from pathological analysis. According to the changes in the intensity modulation of the transmission laser, different blood tests are investigated. The sensor is embedded with these blood samples and the transmission spectra are shown in Fig. 4

Figure (4): transmission spectra of laser biosensor for blood samples at 1.5cm LMA-10 PCF length.

The refractive indices and absorbance of each blood samples which is measured according to the reference intensity and the maximum intensity are tabulated in Table 1.

Table 1. The values of maximum intensity and absorbance for the blood samples with different Hb concentration at (1.5) cm PCF length.

Blood sample	Refractive Index n	Maximum intensity I ₀ (a.u)	Absorbance $A = \text{Log}_{10} \left[\frac{I_{ref}}{I_0} \right]$
Patient No.1	1.34354	2488	0.1036
Patient No.2	1.34591	2470	0.1068
Healthy person No.1	1.34893	1886	0.224
Healthy person No.2	1.35192	1619	0.2903

As a final result, the calibration curve of laser biosensor for detection beta thalassemia trait is shown in Figure below.

Fig. 5. The calibration curve of laser biosensor for detection beta thalassemia trait at 1.5cm LMA-10 PCF length (sensitivity = 24.367 ABS/RIU).

It's shown from Figure 5 that the presence of beta thalassemia trait leads to decreasing the refractive index and then decreasing in the absorbencies of the blood samples to (0.1036 and 0.1068) comparing with absorbencies of the blood samples of healthy people (0.224 and 0.2903).

Conclusions

According to the results found in this study, by using 1.5 cm PCF length, a fabricated laser biosensor based on MZI for detection beta thalassemia trait shows sensitivity of 24.367 ABS/RIU .the maximum absorbance of the normal blood sample is at wavelengths from (470-590) nm. The presence of beta thalassemia trait shows a decreasing in the refractive index of blood sample. Moreover, the absorbance of blood sample for healthy people showed higher values than those for the sample with anemia.

Abstract

The present study was designed to show the effect of magnesium on lipid profile and oxidative stress. The present study used 30 adult albino female rats that distributed to following groups (each group consist 6 rats); control group received ad libidum, second group administrated magnesium (orally, 35.7mg /kg) for eight weeks, third group administrated magnesium (orally, 71.4mg /kg) for eight weeks, fourth group (pregnant rats) administrated magnesium (orally, 35.7mg /kg) for eight weeks, fifth group (pregnant rats) administrated magnesium (orally, 71.4mg /kg) for eight weeks, and then killed. The results showed high significant increased ($P < 0.05$) in levels of lipid profile (total cholesterol, total glyceride, high density lipid (HDL), low density lipid (LDL) very low density lipid (VLDL)), especially in pregnant female rats (third and fifth groups) compared with control group. On the other hand, the results showed significant changes ($P < 0.05$) in levels of malondialdehyde (MDA), *Superoxide dismutase (SOD)* and catalase especially in pregnant female rats (third and fifth groups) compared with control group. It was concluded that the prolong using and overdose of magnesium lead to elevated the lipid profile and oxidative stress in rats especially in pregnant female rats.

Keywords: Magnesium; Lipid profile; Oxidative stress.

Introduction

Magnesium (Mg²⁺) has several functions in the human body. It acts as a cofactor for more than 300 enzymes, regulating a number of fundamental functions such as muscle contraction, neuromuscular conduction, glycemic control, myocardial contraction, and blood pressure [1]. Intracellular Mg stores are found in high concentration in mitochondria [2], where this element plays a pivotal role in the synthesis of ATP (adenosine triphosphate) from ADP (adenosine diphosphate) and inorganic phosphate [3]. About 60% of the magnesium is present in bone, of which 30% is exchangeable and functions as a reservoir to stabilize the serum concentration. About 20% is found in skeletal muscle, 19% in other soft tissues and less than 1% in the extracellular fluid [4]. Magnesium levels in the blood are higher than 1.1 mmol in general hyperglycemia which can be clinically observable in patients with nausea, vomiting, lethargy, headaches. When magnesium reach above 3.0 mmol, it may cause acute cardiac disorders such as low blood pressure, lengthening of QRS, PR

and QT intervals. Excessive hyperglycemia can lead to coma, stunting, and death by cardiac arrest [5-8]. So, the aim of study is detecting the toxicity effect of Hypermagnesemia in female adult rats.

Materials & Methods

Animal model

30 adult female rats (*Rattuss norvegicus*), (wt: 240-280 with age: 4-6 Mon) obtained from Veterinary college/Baghdad, and kept on standard pellet diet and water for two weeks before experiment.

Experimental design

30 adult female rats were used and distributed in five groups (six rats in each group) as following and administrated orally:

Control group received normal saline and normal diet for seven days.

Second group administrated magnesium (orally,

35.7mg /kg) for eight weeks, and then killed.

third group administrated magnesium (orally, 71.4mg /kg) for eight weeks, and then killed.

Fourth group (pregnant rats) administrated magnesium (orally, 35.7mg /kg) for eight weeks, and then killed.

Fifth group (pregnant rats) administrated magnesium (orally, 71.4mg /kg) for eight weeks, and then killed.

Prepare of blood solution

5 ml of blood collected by cardiac puncture under anesthesia and put in test tubes. Then using centrifugation 5000 cycle/min for 15 min. Sera were taken and stored by deep freezing to estimate the biochemical measurement.

Measurements

Lipid profile

Total cholesterol and triglyceride were measured by technique according to the instructions of manufacturer company kit (Randox) [9].

Table (1): levels of lipid profile in all groups

Parameters Groups	S.Cholesterol mmol/L	S. Triglyceride mmol/L	HDL mmol/L	LDL mmol/L	VLDL mmol/L
Control group	2.15 ± 0.34 b	1.29 ± 0.27 b	1.07 ± 0.23 b	0.82 ± 0.50 a	0.26 ± 0.05 b
Second group	2.47 ± 0.23 b	2.19 ± 0.81 b	1.20 ± 0.18 b	0.84 ± 0.18 a	0.44 ± 0.16 b
Third group	2.66 ± 0.59 b	2.09 ± 0.43 a	1.23 ± 0.19 b	1.01 ± 0.61 a	0.42 ± 0.09 a
Fourth group	3.45 ± 0.92 a	1.89 ± 0.33 a	2.19 ± 0.05 a	1.09 ± 0.77 a	0.38 ± 0.07 a
Fifth group	3.78 ± 1.01 a	2.11 ± 0.28 a	2.16 ± 0.16 a	1.40 ± 0.32 a	0.42 ± 0.06 a

Oxidative stress and antioxidants

MDA, SOD and catalase in second and fourth groups show non-significant changes ($P < 0.05$) compared with control group. Also, MDA, SOD and catalase in third

Oxidative Stress and Antioxidant Parameters

MDA (malonedialdehydied) was measured based on the colorimetric reaction with thiobarbituric acid (TBA) using spectrophotometer [10]. SOD and Catalase was measured by using the procedure of Biovision-USA kits.

Statistical Analysis

Data of study were analyzed by using a statistical program known as Minitab. data Means were compared using Duncan's Multiple Range test. Probability levels of more than 0.05 were regarded as statistically non-significant, whereas values less than 0.05 were considered as significant [11].

Results

Lipid profile

Lipid profile (TC, TG, HDL, LDL and VLDL) in second and fourth groups show significant changes ($P < 0.05$) compared with control group. While, Lipid profile in third and fifth groups (pregnant rats) show high significant changes ($P < 0.05$) compared with control group as shown in table (1).

and fifth groups (pregnant rats) show non-significant changes ($P < 0.05$) compared with control group as shown in table (2).

Table (2): levels of MDA, SOD and catalase in all groups

Parameters Groups	Malondialdehyde $\mu\text{mol/L}$	SOD mmol/l	S. catalase U/L
Control group	1.79 \pm 0.39 a	147.40 \pm 7.3 a	126.60 \pm 13.28 a
Second group	2.30 \pm 0.63 a	187.20 \pm 55.93 a	118.00 \pm 14.46 a
Third group	1.85 \pm 0.35 a	194.20 \pm 53.4 a	119.60 \pm 14.31 a
Fourth group	2.43 \pm 0.63 a	153.20 \pm 29.138 a	122.60 \pm 14.83 a
Fifth group	1.98 \pm 0.35 a	155.80 \pm 26.58 a	124.20 \pm 14.70 a

Discussion

The results of present study show significant changes in lipid profiles and oxidative stress. Hypermagnesemia has often been described with the use of magnesium containing cathartics for treatment of drug overdose, in patients taking magnesium-containing cathartics and antacids for therapeutic purposes [12]. Arpaci et al referred in their study there was no correlation between magnesium level and levels of cholesterol, LDL and triglycerides [13], that is not agreement with results of the present study. On the other hand, Philips et al, referred that hypermagnesiumemia lead to necrosis and collapse of liver parenchyma, perivenular hepatocellular and canalicular cholestasis with mild macrovesicular steatosis [14], that explain the increased the levels of lipid profile in the present study. About oxidative stress in this study. The present results show non-significant changes between groups that administrated with magnesium and control group. Same findings reported by Barbagallo et al. who established a strong, direct correlation between RBC Mg levels and GSH/GSSG concentration (circulating reduced/ oxidized glutathione) [15]. In another study, a negative correlation between Mg levels and OS stress markers (plasma superoxide anions and malondialdehyde) was observed in groups of the population chronically exposed to stress [16]. Interestingly, no correlation between Mg intake and antioxidant capacity has been found among Korean adults [17].

Evaluation of Amateur and Professional Tattoo Removal by the Q Switched Nd:YAG Laser

Nibras A. A. Hindy

Department of Dermatology and Venereology, Al-Imam Al-Sadiq Teaching Hospital, Hilla-IRAQ.

Abstract

Background: A tattoo is visible and permanent pigmentation of the skin secondary to the deliberate or accidental deposition of exogenous pigment within the dermis. A variety of procedures have been used to remove tattoos, such as laser therapy, surgical excision, and dermabrasion. QS laser treatment can result in good cosmetic outcomes and complete or near-complete removal of many unwanted tattoos.

Objective: to evaluate the QS Nd:YAG laser effects for amateur and professional tattoos removal.

Materials & Methods: The study was done on 293 tattoo lesions from 176 patients (in both genders), there were 239 amateur tattoos (136 patients) and 54 professional tattoos (40 patients). Tattoos on a wide range of body sites (limbs, feet, face, chest, shoulders and legs) were treated. Ages were between 17- 60 years. In this work, tattoos were divided to amateur and professional tattoos. A Q-switched Nd:YAG laser system was used throughout this study. All tattoos containing black and blue pigment were treated at 1064 nm. Tattoos containing red pigment were treated at 532 nm. Treatment was scheduled at 4-6 weeks intervals and continued until maximum clearance of the tattoo was achieved, and the number of sessions varies from one to five sessions. For assessment of degree of lightening the method proposed by Lanigan was used: grade 1, complete response (> 95% lightening); grade 2, excellent response (76–95% lightening); grade 3, good response (51–75% lightening); grade 4, fair response (26–50% lightening); grade 5, poor response (0–25% lightening).

Results: Amateur tattoos were often more numerous than professional tattoos. Eighty per cent of tattoos (198 of 239) were clinically clear at the time of analysis, this included 70.7% (169 of 239) which were ≥ 95% clear. Overall 56.6% of amateur tattoos were clinically clear after two treatments, and 82% (110 of 134) were clinically clear after 2-3 treatments, while the clinical clearance rate was 40% after six treatments for professional black tattoos. It is anticipated that response rates will increase when tattoos at an early stage of treatment receive further treatments, and P value was (0.004) which means that there is significant difference between two groups.

Conclusion: Amateur tattoos generally require fewer treatment sessions and the response is better than professional tattoos.

Keyword: *Q-switched Nd: YAG laser, Amateur tattoo, Professional tattoo.*

Introduction

Tattoo removal is an increasingly common office procedure often performed by dermatologists with special training in tattoo removal. A variety of procedures have been used to remove tattoos, such as laser therapy, surgical excision, and dermabrasion. Quality-switched (Q-switched, QS) lasers are the standard of care for tattoo removal and treatment can result in good

cosmetic outcomes. A tattoo is visible and permanent pigmentation of the skin secondary to the deliberate or accidental deposition of exogenous pigment within the dermis. There are five major subtypes of tattoo [1,2]:

- **Professional tattoos** – are decorative tattoos placed by professional tattoo artists using a handheld tattoo gun that delivers uniformly deep dense dermal injections of ink. Pigment is deposited more deeply in

the dermis than most amateur tattoos, which can make professional tattoos more difficult to remove. Over time, the ink colors fade as a result of pigment migration into the deeper dermis and to regional lymph nodes via lymphatic's.

●**Amateur tattoos** – are decorative tattoos performed by nonprofessionals, and are often placed by using a handheld needles that deliver India ink or carbon injected at variable depths into the skin . Amateur tattoos are most often black and may contain ingredients such as charcoal, soot, or pen ink and are more superficially placed than professional tattoos.^[2-4]

Cosmetic tattoos - are often applied freehand by cosmetologists to provide permanent makeup in areas where one would apply eyeliner, lip liner, or eyebrow pencil.

Medicinal tattoos- are small gray or blue-black markings placed by medical personnel to designate radiotherapy fields or port placement sites. Similar to amateur tattoos, they are typically composed of a sparse amount of India ink or carbon pigment.

Traumatic tattoos- result from deposits of foreign particles such as metal, glass, dirt, and carbon-containing particles into the skin following mechanical penetration, often follow blast injuries or trauma.^[4,5]

Laser tattoo removal is based on the concept of selective photothermolysis. This theory, first described in the early 1980s by Anderson and Parrish, revolutionized the landscape for laser therapy by allowing for precise tissue targeting, thus ameliorating the risk of dyspigmentation and scarring associated with earlier therapies such as depigmenting agents, cryotherapy, and dermabrasion^[6-10]

The longer wavelength of the Q-switched Nd:YAG laser at 1064 has proven to be more effective in removal of black tattoo, with better penetration of the dermis, less likelihood of absorption by epidermal melanin, and a reduced risk of hypopigmentation. The improved efficacy is attributed to the longer wavelength, higher fluence, and shorter pulse width, and the Nd/YAG laser, at 532nm, has also been used successfully on red tattoos.^[4,11,12]

Patients and Method

262 consecutive tattooed patients were treated at my private dermatology clinic, between June 2010 and

December 2018. From these 262 patients, 66 were excluded because they did not come back after the first laser appointment; therefore a total of 176 patients (159 male and 17 female), and 293 tattoos was included in our study. The patients were aged 17-60 years with skin types III-IV. There were 239 amateur tattoos (136 patients) and 54 professional tattoos(40 patients). Tattoos on a wide range of body sites (limbs, feet, face, chest, shoulders and legs) were treated.

A Q-switched Nd:YAG laser system was used throughout this study. The operating characteristics of the laser were as follows: wavelength 1064nm and 532nm, with spot sizes 3mm in diameter and frequency 6 Hz. The pulse duration was ≤ 15 ns and the energy output 800mj and 500mj respectively. Radiation was delivered via an articulated arm and hand-piece, at a fixed energy density of 10 J/cm². This energy level was selected on the basis of a previous report which showed that energies of 10 or 12 J/cm² cleared tattoos more effectively than lower energy levels^[13].

All tattoos containing black and blue pigment were treated at 1064 nm. Tattoos containing red pigment were treated at 532nm. Treatment was scheduled at 4-6 weeks intervals and continued until maximum clearance of the tattoo was achieved, and the number of sessions varies from one to five sessions. .

Pretreatment evaluation included a clinical description of the site, shape, color and density of each tattoo and photographs taken at each visit, progress was assessed by estimating the percentage area of the tattoo that visibly clear.

For assessment of degree of lightening the method proposed by Lanigan^[14] was used: grade 1, complete response (> 95% lightening); grade 2, excellent response (76–95% lightening); grade 3, good response (51–75% lightening); grade 4, fair response (26–50% lightening); grade 5, poor response (0–25% lightening). The occurrence of adverse events, such as itch, pain, infection, hyperpigmentation and hypopigmentation, were recorded at each visit.

The Nd/YAG laser pulse, at 1064 nm produces an immediate ash white discoloration and slight elevation of the tattooed skin at the site of impact. These changes are accompanied by an audible cracking sound, a brief flash of white light at the target site, and a shock wave which is palpable in the surrounding skin. A typical

wheel and flare reaction follows and the residual erythema fades over 24 hour, and protective shielding of the operator and patient are required. Although transient hyperpigmentation is common, the normal texture of the skin and epidermal markings are retained. The 1064 nm pulse has no significant effect on normal non-tattooed skin.. The Nd/YAG laser pulse at 532nm produces an immediate pure white discoloration and elevation of the skin at the impact site. There is a marked reduction in the auditory component and palpable pressure wave, compared with the 1064nm wavelength. Hypopigmentation occurs commonly at the treatment site, due to the absorption of the 532 nm pulse by epidermal melanocytes.

After laser treatment antibacterial cream was applied, and the patients were advised not to scrub the area, and if a scab should form, it should not be picked, scratched, or removed prematurely.

Results

The age of all patients was ranged from 17-60 years. Amateur tattoos were, in general, acquired at an older age (mean age 33.02 ± 7.9 , range 17-60) than professional tattoos (mean age of 31.12 ± 7.16 , range 19-45 years).

Amateur tattoos were often more numerous than professional tattoos, the patients had two or more tattoos, and one had five tattoos **Table 1**. The majority of tattoos were on the arms 127 (43.3%), forearms 91 (31%), hands 37 (12.6%), Face 17 (5.8%), chest 8 (2.7%) , shoulders 6 (2%), legs 5 (1.7%), and feet 2 (0.6), **Table 2**

Table 3 shows the current status of 239 amateur black tattoos after treatment at 1064 nm. A clinical clearance was defined as a $\geq 75\%$ area clearance of the tattoo. Eighty per cent of tattoos (198 of 239) were clinically clear at the time of analysis. This included 70.7% (169 of 239) which were $\geq 95\%$ clear as shown in **figure 1**. **Figure 2** shows the clearing of a typical amateur tattoo following a one session of treatment.

Table 4 shows the progressive clearing of a typical amateur tattoo following a series of treatments and the cumulative response by the number of treatments, for 136 amateur tattoo patients. The average number of treatments to achieve clinical clearance was two. The higher number of treatments associated with lower percentage clearance in this group suggests that some tattoos are relatively slow responders. Tattoos achieving

less than 50% clearance had received less treatment than the other groups. Overall, 56.6% of amateur tattoos were clinically clear after two treatments, and 82% (110 of 134) were clinically clear after 2-3 treatments.

Table 4 shows the responses of 54 professional black tattoos after treatment. Seventy-four per cent (40 of 54) were clinically clear, including 50% (27 of 54) which were $\geq 95\%$ clear. The progress of a professional tattoo after six treatments is shown in **table 3** and **figure 1**. The cumulative response by number of treatments for 40 professional tattoo patients is shown in **table 4**. Overall, the clinical clearance rate was 40% after six treatments for professional black tattoos. **Figure 2** shows the progressive clearing of a professional tattoo following a third session of treatment.

It is anticipated that response rates will increase when tattoos at an early stage of treatment receive further treatments and the P value was (0.004) which mean that there is significant difference between two groups.

Figure (1) Area cleared of 239 amateur and 54 professional tattoos after laser treatment.

Figure 2 Amateur tattoo on the back of the hand: (a) before treatment: (b) 1 month after the first treatment. And amateur tattoo on the chest: (c) before treatment: (d) 1 month after treatment. Both Show $\geq 95\%$ clearance of tattoo. Professional tattoo on the right arm: (e) before treatment: (f) immediately after first session: and (g) 1 month after the third treatment. Showing slight clearance of black and red tattoo and persistence of green tattoo.

Discussion

Complete laser tattoo removal requires multiple treatment sessions, typically spaced at least 4- 6 weeks apart. At each session, some but not all of the tattoo pigment particles are effectively fragmented, and the body removes the smallest fragments over the course of several weeks. The result is that the tattoo is lightened overtime. [15, 16] Immediately after laser treatment, a slightly elevated, white discoloration with or without the presence of punctuate redness is often observed. This white color change is thought to be the result of rapid, heat-formed steam or gas, causing dermal and epidermal vacuolization. Pinpoint bleeding represents vascular injury from photo acoustic waves created by the laser's interaction with tattoo pigment. [17]

We evaluated in our clinic the efficacy of a laser system providing QS lasers with the wavelengths of 1064 nm and 532 nm treat various types of tattoos. The Nd:YAG laser is an effective treatment for amateur black tattoos and has a low incidence of side effects.

We did not use topical anesthesia in our study because our patients tolerated well to procedure. The energy that selected is 600-800mj because at this range

this energy is enough to cause immediate whitening without punctuate bleeding or immediate blistering to target tattoo lesions at 3 mm spot size. [4,18] And this explains no scar formation i.e. in higher energy density may cause skin damage and subsequently scarring.

Previous study regarding amateur tattoo show that the majority (60%) attain an excellent response after 1 or 2 treatments, but a minority (3.3%) require up to five treatments. Those tattoos with a $< 50\%$ response had received very few treatments. [4]

In our study also show that the majority of patients (82%) attained excellent response in 2-3 sessions, and the minority of patient (5.8%) require more than six sessions in amateur tattoo. While professional tattoo about 40% of patients need more than six sessions, the increasing response with the increasing number of treatments suggests that this group are likely to respond to further treatments.

In other previous study was showed those ten amateur tattoos and two professional tattoos. Of these, amateur tattoos showed an improvement of 69% by GAS and 58% by the PA. In contrast, professional tattoos showed a 40% lightening by GAS scoring and 35% improvement by PA. [19]

Similar finding was seen in our study, an average improvement $\geq 95\%$ in 168(70.29%) patients with amateur tattoos, while response in professional tattoo was 50% (27 patients) .

Amateur tattoos had a quicker clearance rate than professional tattoos. Professional tattoos may require 4-6 sessions more for clearance as compared to amateur tattoos, and this goes with many previous studies. [20-22] Amateur tattoos are less dense with more superficial location of pigment, which is easier to clear. However, few amateur tattoos have deeply placed ink and may be difficult to remove.

In comparison between two group professional and amateur tattoo in response to Nd:YAG laser the P value was (0.004), which means that there is a significant difference between two groups .

Conclusion

The Q switched Nd/YAG laser is an effective treatment for both black and red tattoos with a low incidence of significant adverse effects and provides excellent cosmetic results. Amateur tattoos generally

require fewer treatment sessions and the response is better than professional tattoos.

Abstract

Background: Type 2 diabetes mellitus (T2DM) is a metabolic syndrome that affects a large proportion of the population, if not well controlled; this will lead to serious metabolic problems, including atherosclerosis, predominantly coronary artery disease (CAD).

Irisin is a peptide hormone, secreted mainly by the heart and skeletal muscle. It has a role in converting white adipose tissue to brown adipose tissue. It is one of the novel biochemical markers that link diabetes with CAD.

Objective : To explore the relationship between serum Irisin level and duration of diabetes, in cases of presence and absence of CAD, As well as the possibility of using it as a marker for the assessment of the severity of the disease.

Method: One hundred sixty-one volunteers aged [(40-60 year), body mass index (20- 25Kg/m²)], with normal blood pressure. They divided into six groups, that distributed as [(I_a = control (negative catheterization without DM), I_b = control (apparently healthy), II_a = DM (with negative catheterization) II_b = DM (diagnosed by history and clinical examination), III_a = CAD (without DM, positive catheterization), III_b = CAD + DM (positive catheterization)]. The diabetic groups with and without CAD had been divided depending on the duration of the diabetic onset into three periods (<5, 5-10, and > 10 years). The parameters that measured were FPG, HbA1c and fasting serum (Irisin, lipid profile).

Results: The present findings showed the Means (\pm SD) value of Irisin levels was a significant decrease in (II_a, II_b, III_a, III_b) groups as compared with control groups (I_a, I_b). In addition, there is an inverse relationship between serum Irisin and the duration of DM in the total DM groups (II_a +II_b) and the CAD + DM group (III_b). Moreover, higher statistical decrease in mean serum level of Irisin with duration of DM was found in CAD + DM group as compared with the total DM group. Also, there was a significant decrease in mean serum level of HDL-C for (II_a, II_b, III_a, III_b) groups than in (I_a, I_b) groups. Besides, there was a significant decrease in the mean of serum HDL level in CAD groups (III_a, III_b) than in DM groups (II_a, II_b). While the means of FPG level, HbA1c, serum cholesterol level, were significantly elevated in groups (II_a, II_b, III_b) as compared with (I_a, I_b) groups. Also, there was a significant increase in the mean serum levels of triglyceride, VLDL-C and LDL-C for (II_a, II_b, III_a, III_b) groups than in the control groups.

Conclusion: Irisin was lower among patients with long-standing diabetes (with or without CAD) as compared to those with short duration of T2DM that can be included as a marker for assessment the severity of diabetes and prediction of CAD.

Keywords: Irisin, duration of T2DM, CAD.

Introduction

TYPE 2 Diabetes Mellitus (T2DM) is a heterogeneous syndrome, manifested by abnormalities in carbohydrate and fat metabolism. It is characterized by insulin resistance, a relative deficiency of insulin secretion and abnormal insulin action as a result; abnormal glucose homeostasis ⁽¹⁾.

Abnormality of insulin secretion and insulin action at the target tissues associated with a defect in management leads to hyperglycemia. When hyperglycemia persists for prolonged periods, patients can develop various complications, including both microvascular like, nephropathy, retinopathy, and peripheral neuropathy, and macrovascular, e.g., cardiovascular disease (CVD) ⁽²⁾.

In January 2012, Bostrom and colleagues identified a new muscle tissue secreted peptide, which they named Irisin. It is a cleavage product of fibronectin type III domain-containing protein FNDC5 ⁽³⁾.

Irisin containing (112 amino acid), acts as a hormone (glycosylated protein- hormone), that is released from skeletal muscle following exercise. Irisin secreted by the response of peroxisome proliferator-activated receptor-gamma co-activator (PGC-1 α) activation via training ⁽⁴⁾.

Irisin is mainly produced in the heart, skeletal muscle, kidney, and liver. It is essential to convert white adipose tissue to brown adipose tissue ⁽⁵⁾.

Irisin affect glucose homeostasis. It had also been regarded as an anti-inflammatory marker, in correlation with diabetes and insulin resistance ⁽⁶⁾. Circulating Irisin is positively associated with endothelium-dependent vasodilation in diabetic patients without clinical angiopathy, indicating that low level of circulating Irisin tightly related to endothelial dysfunction and could be a marker for atherosclerosis in T2DM ⁽⁷⁾.

Subjects & Methods

Subjects

One hundred sixty-one voluntaries from (The specialized center for endocrinology and diabetes) and (Cardiologic clinics of Ibn- Al-Bitar hospital) were encountered in this study (September 2017 - September 2018). They were divided into six groups, table (1).

Table (1): Groups numbers and distributions

Groups	Criteria	Voluntaries NO.
I _a	Control / negative catheterization without DM	28
I _b	Control /apparently healthy	25
II _a	DM / with negative catheterization	30
II _b	DM / diagnosed by history and clinical examination	25
III _a	CAD without DM / (positive catheterization)	20
III _b	CAD + DM / (positive catheterization)	33

Method

Two methods have been used:-

Enzyme-linked immunosorbent assay (ELISA) for measuring Irisin (after three months stored in deep freezing -80°C) in the central health laboratory, using the kit supplied by my biosource/USA.

Enzyme colourimetric methods for measuring FPG, HbA1c, Lipid profile, by a spectrophotometer using kits provided by Human Gesellschaft fur Biochemica and mbHMax- Planck Germany.

Besides [the electrocardiogram (ECG), ECHO, tread mill] were done for the groups (I_b, II_b) while groups (I_a, II_a, III_a, III_b) diagnosed by clinical examination of coronary computed tomography angiogram (CCTA), and they undergo catheterization (either diagnostic or therapeutic), this is according to their cardiologist decision (Regardless of search requirements).

Statistical Analysis

The statistical package for social sciences version (SPSS-23) has been used. The statistical significance of the difference in mean of a normally distributed quantitative variable was assessed by the analysis of variance (ANOVA) test, and the statistical significance of the difference in mean between all possible pair of groups was assessed by the least standard deviation (LSD) test. P-value ≤ 0.05 considered being statistically significant.

Results

There was a significant decrease in means serum levels of Irisin for overall groups when compared with that found in control groups [P-value = 0.003]. While the results showed no significant difference in mean of Irisin level [between control groups (I_a and I_b), between diabetic groups (II_a and II_b), and among groups (II_a, II_b, III_a, III_b)], table (2), figure (1).

Table (2): The difference in means of serum Irisin		
Parameter Groups	Serum Irisin (ng/ml) (mean ± SD)	
I _a	A 29.341± 16.213	
I _b	A 30.149 ± 16.032	
II _a	B 9.014 ± 2.009	
II _b	B 9.675 ± 1.931	
III _a	B 5.777 ± 0.450	
III _b	B 3.728 ± 1.283	
LSD	7.427	
P- value	Sig. 0.003	
The Letters (A, B, C) are significant at P ≤ 0.05 (comparison among groups)		

Figure (1): Bar chart showing the difference in mean of serum Irisin

There was an inverse relationship between serum Irisin level and the duration of incidence of T2DM in the [total DM groups (II_a + II_b) and CAD + DM group (III_b), table (3) figure (2).

In the total DM group, the mean serum level of Irisin was [(12.347±0.712ng/ml), (10.922±1.316 ng/ml) and (8.295±1.259ng / ml) when DM duration [($<5y$), (5-10y) and ($>10y$), respectively], There were significantly decreased in mean of serum Irisin levels when the duration of DM was increased (LSD =0.954) [P- value (0.0018)].

In the (III_b) group, the mean serum level of Irisin was [(4.9527±0.3178 ng/ml), (4.0562±0.5580 ng / ml) and (2.4649±0.9561ng / ml)] when DM duration [($<5y$), (5-10y) and ($>10y$), respectively], The results show significant difference in mean of serum Irisin level between duration ($<5y$, 5-10y) compared ($>10y$) (LSD >1.07). While there was no significant difference in mean of serum Irisin level between duration ($<5y$) and (5-10y). (LSD < 1.07), [P- value (0.0026)].

The highest statistically difference in mean serum levels of Irisin with a duration of DM was found in (III_b) group as compared with (total DM) groups, [P- value (0.00031, 0.00046, 0.00053)] for duration [($<5y$), (5-10y) and ($>10y$), respectively], as shown in table (3), figure (2).

Table (3): The difference in mean between serum levels of Irisin and the duration of T2DM in Total DM group & in CAD + DM group

Group Duration (year)	Total DM (II _a + II _b) (mean ± SD)	CAD+DM (III _b) (mean ± SD)	LSD	P-value
<5	A,a 12.347±0.712	A,b 4.9527±0.3178	3.281	0.00031

Discussion

There was a significant decrease in mean serum level of Irisin for (II_a, II_b, III_a, III_b) as compared with that found in (I_a, I_b) groups. Also, when compared the serum levels of Irisin between DM subgroups with and without CAD showed that Irisin decreased when CAD existed but did not reach the significant level (maybe due to small sample size) as shown in the table (2), figure (1).

A study performed by Zhang *et al.* supports the current study the authors found a significant decrease in serum Irisin in T2DM, which further confirmed the potential role of Irisin in glucose metabolism and diabetes. Additionally, when compared the serum levels of Irisin between diabetic patients with and without macrovascular disease, they had found that Irisin significantly decreased when macrovascular disease existed. So they suggested that Irisin would be a potential target for monitoring and intervention of T2DM and its associated vascular complications such as CAD (8). Besides, the founding of the current study resembles those found by El-Lebedy *et al.*, who reported that serum Irisin was significantly lower in diabetic patients and CVD as compared to the control group. Also, Deng reported that serum Irisin level was lower significantly in patients with CAD as compared with healthy controls (9).

The above results were in agreement with more recent results, by Khorasani *et al.*, who found that serum Irisin level was lower in diabetic patients with cardiovascular complication compared with uncomplicated diabetic patients (10).

Studies that have been done to compare the levels of circulating Irisin with the healthy control group have shown a protective effect of Irisin against the development of CVD. Several potential mechanisms have been proposed for this issue. Irisin plays a vital

role in the preservation of endothelial cell function and reduces endothelial damage by inhibiting inflammation, and oxidative stress, so the low levels of Irisin affect the endothelial function and increase the incidence of atherosclerosis. Besides lower circulating, Irisin levels can increase the accumulation of advanced glycation end-products (one of the causes of vascular complications in diabetic patients) (11).

The data and the results in this research did not show any significant difference between the two DM groups (II_a, II_b) for all measured parameters in this study. Therefore, they can be merged and deal with as a single group (total DM) as shown in table (3), figure (2).

The present study showed a significant inverse relationship between serum Irisin and the duration of incidence of T2DM in the [total DM group (II_a + II_b)] and the [CAD+DM group(III_b)], Irisin decreases significantly as the period of diabetes increases as shown in table (3), figure (2).

These results resemble the finding of Liu *et al.*, who pointed out that long-term diabetes is associated with a significant reduction in levels of Irisin (12). Also, the results confirmed those found by two previous studies in which there was a negative correlation between duration of diabetes and Irisin level (13).

Conclusion

The serum level of Irisin is affected inversely by the persistence of diabetes with or without coronary artery disease for an extended period, and the level of decline is significant decrease with an increase in the period of diabetes. Therefore it can be used as a prognostic marker for estimation of the severity of the T2DM.

Abstract

This study is used for measuring the temperature of incubator during its used in the treatment of newborns who suffering from jaundice. The present system is characterized as low cost, easy to use and does not require a highly skilled operator, in which that used of DHT22 sensor based on the Arduino hardware platform. This system facilitates the continuous monitoring and the true knowledge of the temperature of the incubator for determination the period of stay of the child with jaundice in the hospital. In addition, the current system represents not only the possibility of knowing the temperature of the incubator but also a tool to assess the incubator's performance, and find out the percentage of error in the temperature and the difference between the required temperature and the real temperature.

Keywords: Jaundice ; Patient ; physical parameters;

Introduction

Newborns are at raised risk of jaundice, a condition during which excess bilirubin accumulates in the blood. Left untreated, jaundice will result in neurological impairment and death. Jaundice ensuing from unconjugated hyperbilirubinemia is well treated with exposure to blue light¹.

Immediately once giving birth, the child is transferred to a new and completely different surroundings for the mother's womb environment. This setting is certainly not protected and isn't appropriate initially for the child's life because of the changing factors surrounding the newborn particularly the temperature. The premature newborn is homoeothermic, however over a long amount, he cannot maintain the thermal processes. The energy he provides is employed within the following order of priority: for the functioning of important organs, for thermoregulation and growth². Thus it should give a healthful hydrothermal environment to decrease the risk of body hypothermia or hyperthermia for newborn infant³.

The process of measurement the temperature of the therapeutic environment and so understand the perfect conditions for the treatment process is one among the

most necessary things that should be of high interest, because it's an excellent link between the conditions and factors related to the treatment method, and therefore facilitate the study of the impact of temperature alone or combined with different factors in effecting on diagnosing and treatment method.

The Arduino system is considered one among the simplest and most versatile electronic solutions in terms of easy use and speed of learning still as low price of producing components as well as simple to connect and programming by computers, additionally the availability of those electronic components in the local markets, permitting the research worker to work in a very wide space of ideas to dynamical developing and therefore let to get output a lot of comprehensive solutions and optimality.

The main goal of this study is to manufacture an easy system which will provides a precise perception of measurement the temperature within the incubator and therefore facilitate to calibrate and determine the appropriate degree of treatment.

Theory

Neonatal jaundice is one among the foremost

common conditions needing medical attention in newborn babies. About 60% of term and 80% of preterm babies develop jaundice within the 1st week of life, and concerning 10% of breastfed babies are still jaundiced at age one month. Neonatal jaundice is usually harmless, however high concentrations of unconjugated bilirubin could occasionally cause kernicterus (permanent brain damage)⁴.

Neonatal jaundice is common, as a result of physiological jaundice or breastfeeding. In some neonates, unconjugated bilirubin concentration, in addition to different risk factors, is sufficient to permit free bilirubin to cross the blood-brain barrier and cause kernicterus. Another subgroup of infants is jaundiced as a result of elevated conjugated bilirubin; a marker for several pathological conditions. Bilirubin measuring should determine those infants in danger⁵.

Bilirubin is produced from the catabolism of heme within the reticuloendothelial system as shown in Fig. (1). This unconjugated bilirubin is released into the circulation wherever it's reversible however tightly bound to albumin. When the bilirubin-albumin complicated reaches the liver cell, it's transported into the hepatocyte wherever it combines enzymatically with glucuronic acid, manufacturing bilirubin mono- and diglucuronides. The unconjugated bilirubin is reabsorbed into the bloodstream by way of the enterohepatic circulation, adding bilirubin load to the already overstressed liver. This enterohepatic circulation of bilirubin is a crucial contributor to neonatal jaundice⁶.

Fig. (1) Bilirubin Cycle.

Materials and Method

The hardware and software are the main components of this technique, the hardware consists of two elements that are the AM2301 thermal sensing element and also the Arduino Uno platform.

The incubator was in the hospital which has its heat supply, through this sensing circuit the temperature of incubator is measured during treated the newborn with jaundice.

DHT21

The AM2301 thermal sensing element, that sensing digital temperature which contains the compound that has been calibrated the digital signal output of the temperature sensor. Application of a dedicated digital modules collection technology and also the temperature sensing technology, to make sure that the merchandise has high reliability and wonderful long-term stability. The sensing element includes a capacitive sensing element wet components and a high-precision temperature measuring devices and connected with a high-performance 8-bit microcontroller. The merchandise has wonderful quality, quick response, sturdy anti-jamming capability, and low price. The shape of procedures, the standardization coefficients hold on within the microcontroller, the sensor among the process of the heartbeat to call these calibration coefficients. Standard single-bus interface, system integration fast and simple. Small size, low power consumption, signal transmission distance up to twenty meters, creating it the most effective selection of all types of applications and even the most demanding applications. Product for the 3-lead (single-bus interface) connection convenience. Special packages in keeping with user wants⁷. Fig. (2) Illustrates the DHT21

sensor.

Fig. (2) The configuration of DHT21 sensor.

ARDUINO UNO

The Arduino Uno has shown in fig. (3) utilized in this study, that is a microcontroller board grounded on the ATmega328 (datasheet) was chosen as the microcontroller for this study. This was a perfect choice, as the processor is extraordinarily strong and cost-effective. It contains of 14 digital input/output pins (out of that 6 is utilized as PWM outputs), six analog inputs, a 16 MHz ceramic resonator, facilitation for USB connectivity, a power jack, an ICSP header, and a button. Its styles comprise of help that supports the microcontroller in each possible way. To induce to figure with it one has to merely connect it to a computer with a USB cable or power it with an AC-to-DC adapter or battery⁸.

Fig. (3) The Arduino (Uno) type.

A systematic strategy was used for the design of this study, during which the obtained temperature of the incubator was to be detected for 135 patients with jaundice.

So, the information collected from the external sources that are the incubator were obtained employing a sensor. The strategy of management used is a microcontroller, that reads the results obtained from the sensing element to be then mentioned and show the impact on the speed of the healing process for a patient with jaundice.

Results

The measurement system that used in this study enables a real perception of temperature in the incubator environment during the presence of the newborn with jaundice, thus the results obtained represent exactly the conditions experienced by the newborn with jaundice during the treatment, which directly affect the speed of treatment.

To check the real readings of the proposed approach, the temperature of 135 patients with jaundice was compared to the time spent in the hospital is shown in table (1), and also see fig. (4) Which represent the relationship between the time which the child spent at the hospital and the incubator temperature range (° C) for all patients.

Table (1) Illustrates the relationship between incubator temperature ranges with staying period in the hospital.

NO.	Period of staying in hospital	Incubator temperature range (
1	1	33.5-34.5
2	2	32.2-34.6
3	3	31.9-34.6
4	4	29.6-32.8
5	5	29.5-31.6

6	6	31-31.7
7	7	30-30.8
8	8	29.1-30
9	9	29.5-30.3
10	10	29.4-30
11	11	-
12	12	30-30.4

Fig. (4) The relationship between the period of staying in hospital and corresponding temperature ranges.

Discussion

The incubator is considered an artificial womb and

will have the most vital effect of protecting newborn. One of the most important duties of the incubator is to control the temperature of the newborn to achieve thermal neutrality, which is achieved by control temperature stability in the incubator. However, this study shows that there is a large swing in the temperature from one to another, although the fixed value is the same, and that is due to the difference in efficiency of each incubator parts because of its operational life and its ability to work such as heat source and heat radiator and efficiency of thermal insulation of the incubator walls, In addition to the external effect of room temperature at the temperature of the incubator.

This work opens the way for comprehensive study on the conditions affecting the temperature in the incubator to design an ideal incubator that provides ideal conditions that will help to actually reduce the treatment period for patients with jaundice.

Conclusions

The concluding observations of this study explain the effect of the temperature which is the most popular variable affected on the patient stay period in hospital.

It was clearly found that the performances of the fixed environment factors including temperature, humidity and other factors in the mother's womb will disappear immediately after birth. This situation places the newborn in a state of sudden environmental change which requires a necessary and quick adaptation. The child who cannot cope with the new environment and if the mother is different in the blood group and RH factor in addition to children who born before 37 weeks (pre-term) the baby will suffer from jaundice disease.

It is obvious that the changes in baby temperature from the mother's womb temperature is considered as one of the conditions causing or helping diseases and therefore difficult to cure.

It is clear that the patient stay period of the children with jaundice inside the incubator was closely related to the incubator's high temperature, for example the incubator temperature of the children who had been cured in a short period varied between 1 and 3 days were at its lowest rates of 31.9 ° C and at its highest rates of 34.6 ° C.

It was found that the speed of recovery for children with jaundice which the temperature in its incubator

environment is higher than those no closer to the temperature of the mother's womb. This is due to the thermal regulation of the newborn inside the incubator is closer to the degree of the mother womb.

The Role of Global Longitudinal Strain in Early Detection of Doxorubicin Induced Cardiotoxicity in Breast Cancer Patients

Wisam Abbas Hasan¹, Shokry faaz Al-saad¹, Hassan Salim Aljumaily¹

¹College of medicine, University of Babylon, Iraq.

Abstract

Objective: Cardiotoxicity is a recognized side effect of many antineoplastic drugs, particularly anthracyclines which used for breast cancer treatment. The identification of patients at high risk for developing cardiotoxicity would be a good strategy to decrease mortality. the aims was to assess the incidence of chemotherapy induce cardiotoxicity and identifying the reduction in global longitudinal strain in various treatment cycles for the early detection of cardiotoxicity, prior to ejection fraction reduction.

Method: A prospective cohort study of confirmed and newly diagnosed breast cancer patients, who attend the Babylon oncology center in Marjan medical city between the fifth of January and the first of July of 2019.

Results: The mean patient's age was 51.3(±10.5) years, There is no association difference in systolic function during the follow up period. The reduction in global longitudinal strain by 8%-15% from baseline was found in 8 patients, while reduction $\geq 15\%$ from baseline was found in only 2 patients during the follow up period.

Conclusions: Global longitudinal strain drop was observed three weeks after chemotherapy onward without significant reduction in ejection fraction.

Keywords: breast cancer; Doxorubicin; longitudinal strain

Introduction

Breast cancer is the high frequent cancer among women, effecting 2.1 million women yearly, it also causes the highest number of cancer-related deaths among women⁽¹⁾. As result of that the breast cancer is presently a important public health and economical problem and many research on new therapies and monitoring their safety use, should be a priority ⁽²⁾. Cancer therapy has studied in a recent years and it has been proved to risen average of cure in breast cancer, as well as to decrease the recurrences.

However the cardiac toxicity from antineoplastic therapy has become a notable risk of morbidity and mortality in cancer pateints. In patients who develop heart failure from chemotherapy, the mortality rate is increase to 60% by 2 years ⁽³⁾. Cardiotoxicity may appear early or late in the course of the disease, and have different clinical feature from subclinical myocardial dysfunction to irreversible heart failure or even death⁽⁴⁾. The cardiotoxicity refers to a direct influence of the chemotherapy on the entire CVS and

also to an indirect effect by a thrombogenic status or to a hemodynamic flow alteration⁽⁵⁾. In 2016, the European Society of Cardiology has published a position paper recommending the diagnosis of cardiotoxicity occur when the ejection fraction (EF) reduction $>10\%$ for values below normality (53%)⁽⁶⁾.

Early detection of cardiotoxicity has frequently depended upon many cardiac imaging to identify a reduction in LV function without signs or symptoms of heart failure (stage B heart failure)⁽⁷⁾. The use of ejection fraction has important limitations.

The measurement of left ventricular ejection fraction is subject to technique-related variability, which can be higher than the thresholds used to define cardiotoxicity ⁽⁸⁾.

The decreasing in left ventricular ejection fraction is often a late phenomenon, with failure to recover systolic function in up to 58% of patients despite intervention ^(9, 10).

The common measurements allow only the late diagnosis of cardiac dysfunction, which might be mostly irreversible. Therefore, there is major need for other precise and reproducible parameters, able to diagnose the early, subclinical, LV dysfunction and can detect the patients at risk for rapid progression toward irreversible cardiac failure and who can benefit from early therapeutic treatment⁽¹¹⁾. The using of tissue Doppler-based strain imaging and GLS has most constantly determined early myocardial changes during therapy, whereas STE in form of GLS appears to be the best measure⁽¹²⁾.

Global longitudinal strain (GLS) is used in clinical practice aimed at the early detection of changes in myocardial contractile function. However, neither GLS use nor its cutoff value determined to predict cardiotoxicity have been standardized⁽¹³⁾.

The American Society of Echocardiography and the European Association of Cardiovascular Imaging have pointed that deformity changes prior ventricular dysfunction. A reduction > 15% in GLS, immediately after or during anthracycline treatment, was the most informative parameter to predict cardiotoxicity, while a reduction < 8% might exclude its diagnosis. However, there is a grey zone between those two values⁽¹⁴⁾.

Doxorubicin is an anthracycline widely used in many cytostatic treatment regimens, but has limited applicability due to cardiotoxic effect. This cardiotoxicity increases patient morbidity and mortality. The mechanisms of cardiotoxicity induced by anthracyclines include the formation of oxygen free radicals, destruction directly to the DNA, apoptosis, activation of immunological reactions in the myocardium, changes in calcium ions transport, histamine release, and activation of coagulation with the formation of thrombus in coronary arteries⁽¹⁵⁾. Doxorubicin-induced cardiotoxicity may be augmented by increased cumulative dose, association with other cytotoxic drugs, and patients' advanced age⁽¹⁶⁾. In spite of this toxicity, anthracyclines stay the cornerstone of treatment in a lot type of malignancies, including lymphomas, leukemias, and sarcomas, and are still widely used in both advanced and early-stage breast cancer⁽¹⁷⁾. This study was palliated the early global longitudinal strain changes in breast cancer patients.

Patients and Method

This is a prospective cohort study included a convenient patients conducted in the fifth of January and the first of July of 2019 and who came to Babylon

oncology center were asked to participate in this study. Sample size of 40 patients was included. The patients with Age \geq 18 years, newly diagnosis of breast cancer with neither antineoplastic treatment nor radiotherapy, Normal baseline echocardiography study and Antineoplastic treatment planning with doxorubicin. Exclusion patients with Lacking of accurately assessing GLS because of an inappropriate acoustic window, cardiac arrhythmias and/or non-sinus rhythms, Usage of beta-blockers and/or angiotensin-converting-enzyme inhibitors and/or angiotensin receptor blockers, Moderate or severe heart valve disease or Ischemic heart disease and Prior history of treatment with cardio toxic drug and thoracic radiotherapy

The baseline information was recorded in form of patient's age, medical history of DM, HT and dyslipidemia, smoking history, oncological history (side and type of cancer), weight and height was measured by researcher.

Heart rate was measured manually and blood pressure was measured by sphygmomanometer then patient underwent Doppler echocardiogram at the baseline, before initiating the doxorubicin (60 mg/m² IV infusion), three weeks after the first dose and three weeks after the second dose (according to the protocol of Breast cancer chemotherapy). Data was analyzed using SPSS version 23 and used ANOVA test used to find association between variables. Echocardiographic examination was performed with the patient at rest in the left lateral position, using the Vivid E9-GE device (GE, Vingmed Ultrassound Horten, Norway), LCD 17" monitor, with image acquisition with a M5Sc transducer and harmonic imaging. All tests were performed with the same device. Sector and depth were adjusted to optimize the image. The measurements and image acquisition followed the recommendations of the American Society of Echocardiography and the European Association of Cardiovascular Imaging

The following echocardiographic variables were assessed: EF, calculated by using of the biplane Simpson's method, considering the normal value of EF > 54% for the female sex⁽¹⁸⁾.

According to the current recommendations ;diastolic function, evaluated by use of mitral flow with anterograde values of E wave and A wave, tissue Doppler of lateral mitral annulus, measures of S' wave (systolic velocity of the mitral ring) and ; indexed left

atrial volume (mL/m²); tricuspid annular plane systolic excursion (TAPSE).

The GLS was acquired by use of Automated Functional Imaging (AFI) of three clips with images of the left ventricle on three apical views, so that all myocardial segments could be well visualized: 4-chamber, 2-chamber and 3-chamber views. The events

of aortic valve opening and closure were marked. The images were acquired at a frame rate of 40-90 fps (> 70% of heart rate).

Results

40 patients was included. No loss to follow up, the baseline information was showed in table -1-.

Table -1- Patients baseline characteristics.

Variable	Mean(±SD)	Maximum	Minimum
Age in years	51.3(±10.5)	76	32
BMI in Kg/m ²	20.5(±4.1)	33.6	11.9
BSA in m ²	1.7(±0.1)	1.9	1.4
HR in b/m	78(±7.3)	95	64
SBP in mm Hg	13.4(±0.7)	140	120
DBP in mm Hg	83.1(±7.3)	95	60

History of diabetic was found in 12.5% of patients, 10% had a history of Dyslipidemia, 70% of patients had left breast cancer. Most of patients had invasive ductal type of breast cancer (82.5%), table -2-.

Table -2- Patient medical history.

Variable		NO.	Percentage
History of DM	Yes	5	12.5%
	No	35	87.5%
History of Dyslipidemia	Yes	4	10%
	No	36	90%
Laterality	Right	12	30%
	Left	28	70%
Type of cancer	Invasive ductal	33	82.5%
	Lobular	5	12.5
	Others	2	5%

The baseline ejection fraction reading was 66.2% (±5.9) and there was no significant difference in mean between the three readings (p value >0.05). Also for LAVI, TDI, TAPSE and GLS there were no significant difference in mean between the three readings (p value >0.05), table -3-.

Table -3- Comparison of echo parameters changes during follow up period.

Variable	Mean ±SD			P value
	Reading at base line	Reading after 3 week from first dose	Reading after 3 week from second dose	
EF%	66.2%(±5.9)	66.8%(±5.5)	67.5%(±5)	0.58
LAVI	26(±3.8)	26.7(±3.9)	26.4(±3.9)	0.72
TDI(s-)	8.9(±1.3)	9.1(±1.2)	9(±1.1)	0.84
TAPSE in mm	22.1(±2.6)	22.9(±2.4)	22.5(±2.5)	0.39
GLS%	-19.3(±2.4)	-19.8(±2.3)	-19.4(±2.2)	0.59

ANOVA test.

Regard GLS, the reduction in GLS after 3 week from the first dose by 8%-15% from baseline was found in 6(15%) patients, while reduction $\geq 15\%$ from the baseline GLS was found in 2(5%) patients only figure -1-.

Figure -1- PIE chart for the percentage of reduction in GLS after 3 weeks from the first dose.

The reduction in GLS after 3 week from the second dose by 8%-15% from baseline was found in 2 additional patients , while reduction $\geq 15\%$ from baseline GLS wasn't found in any additional patients, figure -2-.

Figure -2- PIE chart for the percentage of decreasing in GLS 3 weeks after the second dose.

Discution

This study was considered as low morbidity profiles and the risk factors that could be related to cardiotoxicity

was relatively low(mean age 51 years, mean BMI was 20.5 Kg/m² , history of DM only in 12.5%, history of dyslipidemia only in 10%, no hypertension, no smoking, no arrhythmia, no previous chemotherapy or radiation). The incidence of cardiotoxicity is fundamental, because it is not uniform in different studies. The cardiotoxicity incidence in a systematic review published in 2014 ranged from 13% to 32%⁽¹²⁾. Studies published by US at 2011⁽¹⁹⁾ and at 2013⁽²⁰⁾ have found an incidence of 20%. Other study found a cardiotoxicity incidence of 10%, lower than that reported by those studies⁽¹⁴⁾. That could be explained by the different morbidity profile of population studied and different age, type of cancer, strain technique and timing of follow up. Despite this hetrogenicity, all uniformly demonstrate that changes in myocardial deformation occur earlier than change in LVEF.

In this study, reduction in the longitudinal strain level was found in 20% of patients three weeks after the first dose and in 6.3% of additional patients three weeks after the second dose and without any decrease in systolic function were noted via conventional echocardiography this similar to many other studies like Iranian study that show considerable reduction in GLS in 13% of patients⁽²¹⁾, Ireland study showed, 18 (26%) of the chemotherapy group, global longitudinal strain was below the lower limit of the control group⁽²²⁾.

Early initiation of heart failure treatment appears important for the recovery of the Left ventricular function in patients who experience a significant reduction in LVEF due to anthracyclines⁽³⁾. Therefore, early identification of impaired systolic function is vital.

Furthermore, given that many breast cancer patients first treated with anthracyclines will then receive trastuzumab, identifying patients at greater risk of developing cardiotoxicity is of considerable advantage. Early identification of those with significant reductions in strain would enable targeted monitoring, together with the institution of supportive therapy with angiotensin-converting enzyme-inhibitors or β -blockers, should further treatment with trastuzumab be required ⁽²³⁾.

In this study, there was no significant reduction in global longitudinal strain with preserved LVEF, this compatible to result of Australian study ⁽²³⁾ and this contrary to other study which showed considerable reduction in GLS after chemotherapy like Iranian study which found considerable reduction in GLS before and after treatment ⁽²⁴⁾ and European study which also found Global systolic strain was significantly reduced immediately after, and 6 months after anthracyclines ⁽²⁵⁾. the reason behind this may be due to short follow up period 6 week only, we studied patients after anthracycline treatment only (with no radiotherapy or adjuvant trastuzumab) and the patients received only 120 mg/m² cumulative dose of doxorubicin where the Cardiotoxicity related to anthracycline treatment has strong positive correlation with a cumulative dose.

Conclusion: There was a reduction in GLS between 8%-15% from the baseline in 8 patients and a reduction in GLS between >15% from the baseline in 2 patients throughout study period and there were no significant differences in the ejection fraction.

¹Mosul University, College of Nursing, Mosul, Iraq

Abstract

Objective: The present study aimed to knowing weak points which is lead to negligence it could be transmission of nosocomial infection.

Material and Method: The sample of the study included 100 nurses were selected randomly from the pediatric, surgical, emergency, I.C.U and operation room departments in AL-Salam and AL-Jamhory Teaching Hospitals in the Mosul City during a period which extended from the 1/10/2018 to 20/1/2019, the data were collected through an observation of each subject of the sample during working with the patients and fulfill in the checklist sheet.

Result: The findings of this research revealed significant values between gender and personal hygiene practices to the advantage of female, also there is significant relationship between level of education and personal hygiene practices to the advantage of colligate nurses.

Conclusion: the present study demonstrated that there was negligence in some personal hygiene practices among nurses such as (hand washing, use protective devices, use protective measures, and hepatitis B vaccination).

Keywords: *hygiene, safety, nurses staff*

Introduction

we can be prevented and controlled Transmission of infections in health care system through the implementation of special precautions which can be standard and basic precautions, which must be applied to all cases from the admission to hospital until discharge, regardless types of diagnosis or infectious degree , and addition (transmission-method) .⁽¹⁾ The patient's care managements in the health facility should be the same level of a "Standard precaution" applied work practices that are essential to formulate a high level of patient's protection, patient's visitors, and health care practitioner.

Warnings points to prevent infection transmission include the following:

hand washing and antisepsis (hand hygiene),use of personal protective like gloves, masks and equipment when handling blood samples and body secretions pay attention when handling of surgical care equipment and soiled linen, protection of needle stick and knife sharp

injuries, environmental management, cleaning from pollution ; and recycled of waste.⁽²⁾ the Infection can be control for most factors which that influencing to the transmission of infection between patients or health workers by using a prophylaxes method starting from hand washing, to all body hygiene and vaccination ⁽³⁻⁹⁾ Many researchers and studies have been seeking over the world health centers about nosocomial infection which are reviled careless to nosocomial infection control and no standards precaution in multi countries. Our research aimed to study the personal hygiene of health care giver staff. In addition the objective was to identify weak points which could lead to transmission of nosocomial infections.

Methodology

Descriptive study design depended to, 100 nurses were selected randomly from the pediatric and carried out that study in, surgical, emergency, I.C.U and operation room departments in (AL-Salam and AL-Jamhory Teaching Hospitals in the Mosul City

during a period which extended from the 1/10/2018 to 20/1/2019. Data were collected by checklist, which is as a guidelines and reference to established (8, 9). A questionnaires format consists of multiple fields and items as the purpose of this study. Checklist papers tested to pilot study in two hospitals on ten nurses to discover any problems and modified according to results. Data

were collected through an observation of each subject of the sample during working with the patients and fulfill in the checklist sheet. To describe and analyze the findings of the study, SPSS program (version 17) was used to analyze the data by using mean, percentage, and ANOVA test at $P=0.05$.
